A one-inch shaft, five feet between hangers, will be deflected from a straight line 9-64ths of an inch by a pull of 28 pounds midway between hangers, while a pull of 56 pounds will cause a deflection of ¼ of an inch. However, there are few shafts of two inches and under that are not constantly deflected ¼ when transmitting power, especially if the pulley is midway between the hangers. The deflection of shafting is approximately represented by the general law that deflection increases as the cube of the length, and inversely as the cube of the diameter. Thus, if we should leave but 2½ feet between hangers, the deflection would be $(2\frac{1}{2})^3 = 15.6$ and $5_3 = 125$, and $125 \div 15.6 = 8$, therefore the deflection at 2½ feet between hangers would be 8 times less than it would be 5 feet between hangers. A 1½-inch round shaft, 10 feet between hangers, will be deflected 9-16ths at the center by 56 pounds.

A three-inch shaft, 10 feet between centers, would be deflected a trifle more than 1-16th at the center by a pull of 56 pounds. The remedy for deflection is more bearings, getting the pulleys as close as possible to bearings, and speeding the shaft up. Small shafting will not break, nor twist off when put up in accordance with the above data.

Many dollars have been thrown away in putting up large and slow-running shafting, which is so expensive at first cost, liable to break for want of alignment and excessive weight. The lighter shafting is by far the most economical in every respect—first cost is less, expense of putting up and keeping up is less, and has a longer life, and runs with less friction.

How many of your readers would be surprised to see a two-inch shaft taking off 100 indicated H. P.? A great many, I think. Still, I have in mine just such a shaft, which has been doing the above amount of work for 11 years, and which was put in to take the place of a four-inch shaft, which had broken repeatedly. I believe I am correct in saying that there is no necessity for a line shaft larger than two or two and one-half inches in any shop or manufactory in the United States. The shaft mentioned above as taking off 100 H. P. made less, I think, than 200 revolutions per minute. The shaft might easily be reduced in area one-half and more by doubling the speed. There are a great many shops, now running with three and four-inch shafting, that might make a few dollars by selling the same and replacing it with one and three-fourth and two-inch shafting. It will be well to remember the following: Never put up a slow-revolving shaft when a fast one will do as well (and that is nine cases out of ten). Increase the bearings, as such increase does not affect the friction, and increases the life of the shafting.—*V. Hook, in American Machinist.*

Hardening and Tempering at One Operation.

Steel hardens when suddenly cooled from a red heat, and whether the heat be extracted by immersion in water or other matter, is of no consequence, so long as it is extracted with sufficient rapidity to effect the hardness. The degree of hardness depends first upon the temperature to which the heated steel is raised; and, secondly, upon the rapidity with which the heat is extracted. Water is the medium mostly used for this purpose, but it is a well-known fact that if water of a sufficient degree of soapiness be employed, the steel will not harden.

It is obvious, however, that the degree of soapiness may be so varied as to either prevent the steel from hardening or to have no practical effect upon the hardening. It is also obvious that it is possible to obtain a degree of soapiness that shall give to the steel any required degree of temper, and thus temper the tool without having to harden it at one operation and temper it at another, which would dispense with the hardening process and thus save both time and fuel, as well as oil or other material ordinarily used for the tempering. That tempering processes will ultimately be based upon this principle there can be no doubt, the difficulties (which will be explained presently) being so slight as to be easily overcome.

In my last communication I described one method of tempering at one operation, and I have now to describe another method which has been employed by the Monitor Sewing Machine Company to temper their small spiral springs.

In this process the steel is heated to the usual degree and cooled in a mixture of milk and water. The proper proportions of milk to water would undoubtedly vary with the quality of the milk, hence it must be arrived at by trial. The more milk the lower the temper, all other things being equal, and conversely the less milk (in a given quantity of water) the higher the temper. The proper mixture once attained, the tempering can be carried on very expeditiously, but it is apparent that such a process is more suitable for tempering in quantities than for single pieces, especially when the grades of steel may be variable.

The difficulty in obtaining uniform results lies in the difficulty of heating the pieces to an exactly equal temperature before dipping them, for it is found that a very small difference in the heat of the steel makes a wide difference in the degree of temper obtained, but it may be stated positively that with a uniformity of heat the best of spring tempering may be obtained.

In this connection, there arises the question whether a good spring temper may not be obtained by heating the steel to a low red heat and mixing a lesser quantity of milk therein (the requisite quantity to be determined by experiment). If such is the case, as seems highly probable, the process is expedited in the heating part of it. This would leave the steel tougher, while, at the same time, it would obviate the liability of burning the steel.

The easiest method of heating would, in this case, be to employ a flux heated to the required temperature.

For a higher grade of temper, such as is represented in color tempering by the shades of yellow and light brown, it is probable that it would be necessary to heat the steel to the usual degree for the hardening process, but even then it would require experiment to determine the proper temperature.—*Joshua Rose, in Blacksmith and Wheelwright.*

THE TRANSMISSION OF MOTIVE POWER BY ELECTRICITY.—At the Shaw's Water Chemical Works, Greenock, a practical experiment of this kind is now in progress, which is of special interest. Two of Siemens' dynamo-electric machines are used for the purpose, a waterfall behind the works furnishing the power. The waterfall drives the turbine, this in turn drives the first electric engine from a shaft and belting, and the electricity generated is conveyed by the metallic conductors to a second engine in the shop, 150 yards off, where it is converted into mechanical energy, which is distributed by the usual mechanical devices, to the places where it is required. In this case the machine drives a circular saw, a turning lathe and a vertical boring machine. The trials above named are said to be, for the present, purely experimental. They have a special interest, however, as being among the first, if not the first attempts to actually test the practicability of transmitting motive power by electricity.—*American Manufacturer.*

SCIENTIFIC PROGRESS.

Why the Sky Appears Blue.

"Why is the sky blue?" is a question, says a recent number of the *Academy*, which has often been asked, but never satisfactorily answered. Helmholtz offered an explanation which depended on the reflection of solar light by the air particles in the atmosphere. These particles being very minute would reflect preferably the shortest waves of light, namely, blue waves, while they would allow the longer waves, corresponding to green and red light, to pass through them; just as a log of wood floating on the surface of still water would throw off the tiny wavelets caused by a falling drop in its neighborhood, while the same log in long ocean swells would be tossed to and fro without noticeably impeding the progress of the wave.

Dr. E. L. Nichols (in the *Philosophical Magazine* for December) has propounded another view, which has much to recommend it. According to Young and Helmholtz's theory of color-impression there are in the eye three sets of nerve-termini, one set chiefly influenced by the red, another by the green, the third by the violet rays. The impression of color is the resultant of the intensities of these three effects. The impression upon these nerves is not directly proportional to the intensity of the ray, the different nerve-termini being subject to different laws. For very feeble rays the "violet" nerves are very sensitive, while the "green" and "red" nerves scarcely act at all. As the light increases in intensity the "red" and "green" nerves increase in activity, while the "violet" nerves become tired and dazzled. For rays of dazzling brilliancy the "red" nerves are in their most sensitive condition. Thus, of the simple colors, as the brightness increases, red and green change to yellow, blue becomes white. Daylight at ordinary intensities affects the three sets of nerve-termini equally; the resultant impression is whiteness. Now daylight is simply the light of the sun weakened by manifold diffuse reflections. The direct rays of the sun, as we let them fall upon any colorless object, appear also a white light; but on attempting at noon on a clear day to gaze into the sun's face the impression is of blinding yellow. It is not that the direct rays differ in composition from diffuse daylight, but that the "violet" nerves cannot transmit the action of such strong light. The moon, with enormously less illuminating power than the sun, seems bright, and is far brighter than the open sky. In passing from the intensity of the moon's rays to those reaching us from a corresponding bit of the open sky, we may, perhaps, take a step as great as that between the brightness of the sun and moon. In general, white light will appear bluer and bluer as its intensity diminishes, and this law will apply to the skies; as the light they reflect becomes fainter and fainter they will increase in blueness, even though the light by the process of reflection suffer no change in composition.

ON THE PROBABLE TEMPERATURE OF THE PRIMORDIAL OCEAN OF OUR GLOBE.—According to the latest hypotheses as to the quantity of water on the globe, its pressure, if evenly distributed, would be equal to a barometric pressure of 204.74 atmospheres. Accordingly water, when first it began to condense on the surface of the globe, would condense at a much higher temperature than the present boiling-point under ordinary circumstances. The first drops of water formed on the cooling surface of the globe may not impossibly have been at the temperature of molten iron. As the water was precipitated, condensation of the remaining vapor took place at a lower temperature. The primordial atmosphere would be more oblate and less penetrable by solar heat than the present, and the difference of temperature between polar and equatorial regions would be greater; so that, in the later geological times, ice may have formed in the one, while the other was too hot for animal or vegetable life.—*Phil. Mag., Jan., 1880.*

A MINERALIZED FOSSIL.—Some specimens collected in South America by M. Fremier, who was for some time director of the silver mines at Caracoles, have been examined in Paris by M. Jannettaz, who has discovered among them an extraordinary example of an ammonite transformed into native silver. It was found with a number of other ammonites belonging to the two species *A. peramatus* and *A. plicatilis*, but these had not been mineralized with silver-salts. The ammonite in question has, on the other hand, been entirely replaced by chloride of silver, which has been partially reduced to the metallic condition. Light is thrown by this specimen upon the origin of the native silver which occurs in the Caracoles mines; for it is only fair to infer that this metal has, in like manner, been reduced from the state of chloride at a period not earlier than the deposition of Oxford clay. The description of this ammonite in silver will be found in the current number of the *Bulletin* of the Geological Society of France.

Difficulties in Surveying.

During the last few weeks, the magnetic needles of our galvanometers have shown their sensitiveness to the electrical changes in our atmosphere. About a fortnight ago, I was rather struck on observing the leaves of a gold-leaf electroscope promptly diverge and suddenly collapse, owing to the discharge of atmospheric electricity in our latitude.

Several times in succession the behavior of the electroscope was magnificent, inasmuch as I sat up late at night recording no less than 27 charges and discharges of the leaves. This prompted me to attach by a wire one binding screw of a galvanometer to the rails of a wagon-way which has a length of about 10 miles. The other binding screw of the galvanometer I connected to the gas pipes which pass through our villages. By this means I had an earth connection of about 100 square miles. The circuit completed I anxiously awaited results. Scarcely had I made the connection than the needle of the galvanometer quivered to the right and left of the zero point. Sometimes a deflection was caused having an angle of three degrees; but the majority of deflections were upwards of seven degrees. Afterwards I tried a shunt, but utterly failed to register accurately the amount of deflection. At every deflection of the galvanometer the surface of the earth had its electrical condition changed. The storms were, in the majority of cases, unheard, and seldom a flash of light was seen.

Having the opportunity the other day to be standing beside a mining dial in a mine having a depth of about 170 fathoms, I stood in amazement at seeing the *north end* of the needle *repelled* by a brass Clanny lamp, having a copper gauze. Certainly we know that carbonic acid, hydrogen, oxygen and nitrogen repel the magnetic needles of our surveying instruments, but not such an amount of dia-magnetism is found in the above-named gases as to be taken into consideration. Copper showing the greater dia-magnetic properties over the gases no doubt accounts fully for the behavior of the needle, as the latter must have been particularly sensitive to the electric state of the moving current. Such phenomena, though occurring at rare intervals, give rise to a series of questions, on which the best authorities seem not at all agreed. It would appear from the action of the various magnetic needles under these most strange circumstances that they are ever in search of a position of rest.

Should the magnetic curve be traveling westward in any locality, and awaiting the earth's electrical equilibrium to be restored, no doubt at these precise moments a bundle of errors can be committed even by the most skillful and practised surveyor. Or, suppose the magnetic curve be traveling eastward, the more glaring will be the error in long and delicate surveys. The direction of the earth's magnetism has a close relation to the earth's shape, but as we know it is not in any way the cause of this shape, we may suppose that the figure of the earth and the rotation, which causes the earth to keep this figure, have something to do with the production of magnetism.

At present there must be some influence at work which, along with the earth's rotation, results in magnetism. What is this influence? I venture to say the sun. The most distinguishing features of it are chiefly these four:—(1.) Its rifts and general radiating appearance. (2.) The crossing and bending of rays. (3.) Its self-luminosity, as spectroscopic observations have shown. (4.) Its changing and flickering character. After a prolonged period of solar quiescence, the disc of the sun is beginning to assume new features, and will most assuredly cause magnetic storms.

The late French mathematician (Leverrier) long since pointed out the absolute necessity of care, and warned surveyors against the hasty conclusions arrived at of their surveys.

Under the present circumstances long and delicate surveys ought to be deferred, if possible. Time forbids me saying more.—*Ralph Loudon, in Colliery Guardian.*

EARTHQUAKES AND THE PLANETS.—Mr. J. Delauney has presented to the Paris Academy of Sciences some new results obtained from a study of Perrey's tables of earthquakes from 1750 to 1842. He finds two groups of maxima, commencing in 1759 and 1756 respectively, each with a period of about 12 years; and two other groups, commencing in 1756 and 1773 respectively, with a period of about 28 years. He remarks that those of the first two groups coincide with the times when Jupiter reaches the mean longitude of 265° and 135°; while those of the last two coincide with the times when Saturn reaches the same longitudes; whence he infers that terrestrial earthquakes have a maximum when these planets are in the mean longitudes mentioned. Delauney attributes the increased number of earthquakes in winter, which Perrey has found to reach a maximum in November, to the passage of the earth at that time through swarms of meteors; and in like manner supposes the influence of Jupiter and Saturn to be due to their passing through meteor streams situated in mean longitudes 135° and 265°. As a consequence of this he ventures to predict an increased number of earthquakes in the years 1886, 1891, 1898, 1900, etc.

Mining Share Market.

The dnllness which bas overclonded stock transactions, and which was long since considered as extreme, is still becoming more intensified. The stringent measurcs whicb the Legislature seems determined to place upon tbis branch of busines, bas added materially to the absence of activity. But it is not only in the application of such measures to stock transactions that the inertness of tbe market may be attributed. Tbere appears to be danger that some enactments may be passed wbicb will affect the interests of stockholders and depreciate the value of mining securities, making them burthensome to hold. While these measures are in abeyance, the condition of doubt and uncertainty precludes any marked vitality.

The sales have been exceedingly ligbt, witb no pronounced advance in figures, tbe general range tending to a falling off in prices.

Some little spurts have occurred from reported strikes, but nothing of tbis kind can be permanent until full confidence is restored by a settled status in our laws.

Bullion Shipments.*

Since our last issue, we bave noticed tbe following bullion sbipments :

Belmont, Feb. 2, $2,415.12; Alexander, Feb. 2, $3,199.96; Feb. 4, $3,593.06; Feb. 6, $2,354.81; Ontario, Feb. 10, $5,663.68; Feb. 11, $5,742.58; Feb. 12, $5,624.74; Feb. 14, $3,987.51; McCormick & Co., received Feb. 9, $6,950; Feb. 10, $8,900; Feb. 12, $6,750; Feb. 14, $10,700; Richmond, Feb. 10, $13,072.09; Horn Silver, Feb. 9. $7,500; Feb. 12, $12,000; Stewart, Feb. 9, $11,000 ; Paradiee, Feb. 10, $2,500; Feb. 11, $3,880.74; Christy, Feb. 13, $5,697; Feb. 11, $2,187.21 ; Tombstone, Jan. 31, $1,703.15; Feb. 1, $1,525.79; Corbin, Jan. 31, $1,715.34; Feb. 1, $1,668.10; Northern Belle, Feb. 11, $6,063.26; Eureka Con., Feb. 13, past 7 days, 221,485 lbs ; total for 1879, $2,767,600; Argenta, Feb. 16, $15,500; Wells, Fargo & Co., at Eureka, Feb. 14, $1,000; Germania, Feb. 14, $1,450; Salt Lake City, Feb. 13, one week, $102,933.

*Desiring to make our list of Bullion Shipments as complete as possible, we will be thankful to receive from mining Superintendents and Secretaries notice of all bullion shipments from their respective mines.

THE U. S. troops were enticed into an ambush by hostile Indians in New Mexico, near the San Andreas mountains, and severely handled. They were subjected to a murderous fire, and were compelled to retreat with loss of rations and bedding. The Indians drove the troops across the river witb a severe loss in numbers.

THE Superior Court in banc has decided tbat the ordinance known as the "Dive Ordinance," whicb forbids women to attend in saloons under certain conditions, ie in conflict with tbe clause in the Constitution which declares that no distinction shall he made between tbe sexes in the matter of legitimate employment.

THE wbite steerage passengers of the *City of Peking* were released from the quarantine hulk at San Francisco Feb. 17tb. The Chinese remain.

A MONUMENT is to be erected in Westminster Abbey to Prince Louis Napoleon.

Mining Summary.

The following is mostly condensed from journals published in the Interior, in proximity to the mines mentioned.

CALIFORNIA.

BUTTE.

SPRING VALLEY.—Chico *Record*, Feb. 14: Is cleaning up all the bedrock now exposed in the claim, preparatory to the transfer of the property to the new syndicate. The amount of bullion, when they get through with this clean-up, will astonish everybody in its mammoth proportions. It is the intention of the new company to create another outlet for their tailings by boring a tunnel through the mountain and carry their tailings to the west branch of the Feather river, 15 miles above Oroville. This tunnel, it is estimated, will take 100 men two years in its construction, but when finished will give them much better facilities, as well as a greater fall from the mine. A new water ditch is also in contemplation which will add materially to the working force to be employed.

CALAVERAS.

A NEW CLAIM OPENED.—Calaveras *Chronicle*, Feb. 14: Work has been commenced in the McCann hydraulic on Tunnel ridge, under the auspices of the new proprietors, Messrs. Emerson & Kendall. Four hundred inches of water are used and a full force of hands is employed.

EL DORADO.

GROSS.—Placerville *Mountain Democrat*, Feb. 14: With 10 stamps the ledge (or quarry) matter was tested for three months, the profit amounting to full 50% of the gross product. Twenty new stamps were put in, and when the 30 got to work, Mr. Gross estimates that the net yield will amount to $1,800 a week. The amount of material that may be cheaply taken out and milled is enormous. There is a mountain of it.

FRESNO.

PLACER MINING ITEMS.—Fresno *Republican:* Thie has been a remarkably good year for placer mining in the river bed. With the exception of one or two rises, the water has been lingering at and below low-water marks, enabling gold seekers to invade and work the very bottom of the stream, turning the current at will. The river is mainly infested with Chinese miners who, with pan and rocker, succeed in gleaning the river bed of its precious deposits. They are miscellaneously distributed up and down the river a distance of 20 miles. A company of 20 Chinamen recently completed the working of a claim in the river about eight miles above Millerton. The Superintendent, who speaks very good English, reports the following result: Cold taken out, $5,000; expenses, $1,500; time, two months. Recapitulation: Net earnings, $3,500; dividend to each, $175; or over $87 per month. Similar statistics have been obtained from other Chinese companies, but this one is above the average. Besides these Mongolian gold seekers, there are several American companies and individuals mining the river. Donahoe & Co. have, this winter, constructed a huge dam across the river about 20 miles above here. The dam was completed prior to and withstood the recent winter freshet. The place they propose to work has long been known for its flatteriug prospects for gold. Indians have been known to dive down and bring good pay dirt from the surface of the claim.

INYO.

LUCKY JIM.—Inyo *Independent*, Feb. 7: Is said to be turning out more ore and looking better tban at any time for several years. Its developments are of such an encouraging character that Supt. Williams, who is now down at the Bay, strongly recommends that the company sink a new working shaft, by which, with other advantages, two handlings of the ore can be saved. The new shaft will be 400 ft in depth to reach the lower levels.

MURDOCK.—The parties operating the Murdock mine and furnace shipped 27 tons of bullion, worth $340 per ton; in a few days more another lot will be ready, making enough in all to pay off every dollar of the company's indebtedness, at least to the creditors who are operating the mine for that purpose. A few men in 11 days took out ore enough to keep the furnace running for 25 days, and, from present indications, can continue doing so at the same fate indefinitely. Tbis tbey are doing, and tbe furnace is still running.

CUETER.—Is being re-opened, witb very fair prospects.

MARIPOSA.

CRANBERRY.—Mariposa *Gazette*, Feb. 14: On the Merced river, two miles above the Ferguson mine, is said to be developing some rich ore. A mill is contemplated soon to be erected, which promises an outlook of prosperity in that section. Mr. Craig, one of the owners, we believe, ie prosecuting the work.

SOUTH HITE.—Is prosecuting tbe work in sinking shafts, running tunnels, etc.

MONO.

NOONDAY.—Bodie *Free Press*, Feb. 12: The crosscut on the 400 level is in 150 ft east. The crosscut east from the 500 level is in 150 ft. No. 1 vein has been cut in both of these levels. The winze on No. 5 vein, 300 level, is down 60 ft, the vein continuing strong and looking well. The upraise in No. 1 in Noonday is up 110 ft. The upraise from No. 2 North Noonday is up 145 ft; the connection will be made with the 500 level in a few days. Have connected vein No. 1, on the 300 level, with the winze near the old Noonday shaft, which insures perfect ventilation in all stopes in the mine.

BELVIDERE.—The north drift, 400 level, is now in 66 ft, and the west crosscut 36 ft. At a point 100 ft north of the shaft, east and west crosscuts will be run. The winze which had been started in the south drift, 60 ft south of the shaft, on Monday night made connection with a north drift from a west crosscut that the Bulwer company had run over into the Belvidere ground, this crosscut being the one run from the 433 level of the Bodie mine. The course of the ledge will carry it off Belvidere ground into tbe Bulwer in something over 100 ft, so the Bulwer company now have to run this drift south and into their own ground. The connection secures thorough ventilation to the mine, as well as a means of outlet in the event of accident. At the point where the south drift is started, the ledge is 30 inches wide, of clean ore. An upraise has been started near the top of the winze, to determine tbe extent of the ore body. The ledge is one of great size and strength, being fully eight ft wide of ledge and ledge matter.

BULWER CON.—The nortb drift on the Ralston ledge is in 49 ft. The ledge in the face of this drift is three ft wide of good ore. The south drift is in from the tunnel 57 ft. The ledge in this drift is three ft wide and looking well. The north drift on the Stonewall ledge has a total length of 55 ft, with a ledge in the face 18 inches wide of good ore. The south drift is in 51 ft. The ledge in this drift is two ft wide. The stopes on the Ralston ledge are looking well, the ledge being three and a half ft wide, of high-grade ore.

STANDARD CON.—The main shaft has reached a depth of 786 ft. The bottom is at present in hard rock. The north drift from the east crosscut, 500 level, is in 25 ft, showing a ledge two ft wide of good ore. The north drift, 385 level, is in from the main east crosscut 952 ft. The ledge at this point is four ft wide, of good milling ore. The south drift is in 336 ft from the crosscut, with a ledge in the face two and a half ft wide, of good ore. An upraise has been made on the Cook ledge, which is now 17 ft above the drift. The ledge here is four ft wide, and is looking well. The nortb drift on the east ledge, 300 level, shows a ledge two and a half ft wide, of rich ore. The south drift from the west crosscut is in 172 ft. The ledge in this drift is three ft wide, of rich ore. The north drift, 550 level, is in 67 ft, with a vein in the face four ft wide, of good milling ore. In the north drift, 385 level, the ledge is 25 ft wide, and yields high-grade ore. The West Standard stopes continue to look well, the ledge being four ft wide, of rich ore. In the stopes on the Cildea vein the ledge is three and a half ft wide, and looks well.

QUEEN BEE.—The north drift, 400 level, is in 70 ft. The ledge in the face has improved materially during the past week. It is six ft wide, of a very fair character of ore. In the level above, improvement was shown in drifting in the same direction, but not in the same degree as on the 400.

JUPITER.—The flow of water in the 600 level has so far decreased that it has been regarded as safe to begin operations there. Work has been resumed in the west crosscut from the end of the main south drift, 275 ft south of the shaft, which is now in 65 ft. A west crosscut has also been started from the southwest drift, 150 ft southwest from the shaft.

SUMMIT.—The north drift, 530 level, has a total length of 84 ft from the shaft. The ledge in the face is two ft wide. The south drift is in 95 ft. The ledge here is three ft wide.

SOUTH BODIE.—The boiler and pump at the 300 station are set and started up. The machinery works smoothly all around, and the company will soon have the water out and be able to test the new find, which there is reason to believe will prove to be a good ledge.

DOUBLE STANDARD.—The north drift from the east crosscut, 200 level, has a total length of 111 ft. The south drift, same level, is now in 130 ft.

UNIVERSITY.—The work of sinking the new shaft is being pushed vigorously, being now down 320 ft. The rock is hard, but blasts well. Large seams of clay and quartz are appearing, and a favorable change of ground is looked for.

DUDLEY.—The main west crosscut, on the 500 level, is in 245 ft. The ground is somewhat harder, being now a heavy block rock, full of clay seams. There has been a regular improvement in the formation as the work progresses.

BODIE BLUFF CON.—The usual progress has been made the past week in the incline, which is still following the footwall. The vein is widening and improving in quality of ore.

SOUTH NOONDAY.—Bodie *News:* Shaft down 152 ft. Numerous small strata of quartz and clay, rich in free gold, are continually coming into the shaft from the west. The seam of rich ore cut last week has passed out and is now on the east line of the shaft; at the depth of 150 ft a station set is being put in place, preparatory to cutting the station and running a crosscut to the Cummings ledge, that is expected will be found within 25 or 30 ft of the shaft.

SOUTH BULWER.—Sinking the main double-compartment shaft and making good progress. Total depth, 500 ft. Ground in the bottom, birds-eye porphyry, very hard, but of a favorable character. Pumps are working well and handle the water easily. Sinking is now being done with Burleigh drills, which are doing good work and expediting the sinking very much, a vast improvement over hand drilling.

STANFORD CON.—The shaft is 300 ft deep, double compartments and timbered the whole depth. At the bottom a station has been opened and crosscuts east and west are being pressed rapidly. The west crosscut is now in 115 ft. The east crosscut has a total distance of 145 ft. The rock soft and indications favorable. The face of the crosscut is a solid body of clay and quartz.

BOOKER.—Bodie *Chronicle:* The south crosscut on the 300 level is in 230 ft from the shaft, and looking well, the vein being 20 inches wide and dipping to the east. A crosscut has been started ou tbo 400 level.

NEVADA.

GENERAL GRANT.—Truckee *Republican*, Feb. 14: It was located last January, on the other side of the lake, by Capt. W. W. Lapham, and has been incorporated—the capital stock being fixed at $15,000,000, divided into 100,000 shares. Specimens have assayed as follows: No. 1. $3,010; No. 2, $3,016; No. 3, $1,809; No. 4, $1,294. But of course these are very rich specimens, and not an average. Out of ten pieces of rock picked out promiscuously, the average was $107, which shows a remarkably rich mine.

EL CAPITAN.—Nevada *Transcript*, Feb. 14 : A 50-inch ledge of ore, rich in sulphurets, was struck in the 150 level, 110 ft south of the incline. It bas been opened for 10 or 12 ft, and is regular in quality and widening. It runs in a southerly direction and pitches east.

RICH STRIKE.—W. M. Kirkham and Wm. Hitchcock, who have been working near the Mt. Vernon House, a mile north-west of Blue Tent, report a rich strike. Their shaft is down 36 ft on a ledge a ft tbick, from which they are getting $100 worth of gold a day by using a hand mortar. They think the ore will pay $2,000 a ton, and say it is of even grade as far as developed. There is considerable excitement in that neighborhood over the strike.

FORTUNA.—The new shaft has reached a depth of 30 ft, and contains three compartments, the total dimensions being 10 by 14 ft, and well timbered.

NEW OPHIR.—Is the name under which the old Allison quartz mine on Selby Flat, recently re-located by Messrs. Eddy, Hicks and Rodda, now goes. Some very rich specimens continue to come from the workings, and they think they have a good mine. They have purchased an arastra, hurdy, etc., from tbe Mitchell, Martin & Co. claim on Canada hill. They have taken out 20 tons of good-looking ore that shows well in gold.

UNION.—Is situated west of and near tbe Banner. Fifteen years ago it was a good producer. The ledge was worked out at a big profit near the surface, an incline 300 ft deep was put down, then water came in too fast for the machinery in use. It originally sold for $15,000, but for the past 13 years it has remained at a standstill so far as any developments by the purchaser—John Parrott, of San Francisco, are concerned. Five years ago it was relocated, and enough work has been done to comply with the law to entitle the re-locators to its ownership. They have sunk a shaft, and are now engaged in running for the ledges, of wbich there are two, one being about three ft thick and tbe other smaller. It is stated that Mr. Parrott proposes, in case they make a rich development—which they are likely to do at most any time—to use for recovery of the claim. They are confident they can hold it in spite of all bis efforts. There promises to be a lively contest as to their respective rights, in case Mr. Parrott's intentions are correctly represented.

WASHINGTON ITEMS.—The mines in this district at the present time are looking exceedingly well. The Yuba company are running their main tunnel ahead rapidly. The ledge is seven ft wide, and ehows gold in every inch of it. They have 200 tons of rich rock on the dump, and will start the mill running as soon as the weather will permit. The company are preparing to erect sulphuret works in the spring. The Lindsey mine is looking well. They have a 9-ft ledge that promises to be the mother vein of this belt. The mill has not been running regular this winter on account of the cold weather. Cole & Mead have four locations on the same range, and are preparing to erect a 10-stamp mill in the spring. Wing and Freeman have a good mill on Alpha hill, and soveral other mines in this vicinity are being worked.

ALPHA.—Grass Valley *Union*, Feb. 14: It is on a parallel vein to the Idaho, lying north of it on the opposite side of Wolf creek. The new steam hoisting works were started up last month, and the work of sinking the shaft has gone to a depth of 90 ft. The ledge bas a width of from 18 inches to 2 ft, and shows well in fine free gold and heavy sulphurets. From cuts and shaft, to the depth of about 60 ft, the rock yields from $17 to $28 per load. The shaft will be sunk to a depth of 120 ft before drifts are started, when there will be backs sufficient, with a strong ledge, to turn out regular crushings.

ROCKY BAR.—The new quartz mill has started up, and contains two batteries of five stamps each, the stamps weighing 800 pounds. Each battery is supplied with quartz by self-feeders. In addition to the copper plates and blankets used below the batteries, there are two Eureka rubbers, five Hendy concentrators and two grinding pans, which gives all requisite machinery for amalgamation, and the concentration and saving of sulphurets. The mill starts on a run of 300 loads of rock, and no clean-up will be made until it is crushed. The extraction of quartz will go on. A contract for sinking the main incline 75 ft deeper has been let.

PLACER.

SOUTHERN CROSS.—Dutch Flat *Forum*, Feb. 12: The blast of 8,500 pounds of Judson powder did good execution. The drift extended in the direction of town. The first clean-up of the season at this mine will be made the last of this week.

TULARE.

EMPIRE.—Visalia *Delta:* Has struck a body of rich ore in shaft No. 3, which increases in richness as it goes down. All the available force is now working on the upper levels, but operations will soon be resumed on the lower tunnel, which it is estimated will strike the ore body by running about 160 ft further. They will start the mill again in two or three weeks. There has been no general clean-up although a quantity of amalgam is on hand. A few bars of bullion were run for samples. We have seen one valued at $433. It is now demonstrated that the Empire is free-milling rock.

TUOLUMNE.

CONTINENTAL.—Tuolumne *Independent*, Feb. 14: It i situated on the south bank of the Stanislaus river, a quarter of a mile from the U. S. Grant mine in an easterly direction. It was bonded for $10,000 by a San Francisco company two months ago, and is now in process of development. Work on the shaft is being pushed rapidly; it is now down 75 ft. The vein is well defined, with favorable showing. It having an altitude of 2,000 ft above the bed of the river, no great length of tunnel is required to tap the vein 800 or a 1,000 ft deep. The character of the ore is like that of the Riverside, which is a parallel vein.

RIVERSIDE.—Driving the new level, with the aid of the Burleigh drill, is progressing rapidly. This level will tap tbe vein 450 ft below the old stopes, and is 100 ft above the bed of the river. Length of tunnel to reach the vein, 400 ft. When completed, miners will be set to work extracting ore, and the 20-stamp mill put in operation. The tunnel will give drainage to the mine, by which all difficulties arising from seepage water will be obviated for years to come, and also make available hundreds of thousands of tone of good milling ore.

KELTZ.—Discovered in 1862 by Keltz, who located and immediately commenced operations towards developing it. The lead opened out very encouragingly. After sinking a few ft on the vein he (Keltz) was offered $30,000 for the mine, on these conditions: The purchasing parties reserving the privilege of sinking 60 ft on the vein, and if the prospect held good at that depth, the $30,000 to be paid over and transfer made. Keltz, however, holding out for $50,000 caused tbe negotiating party to withdraw their offer. This mine has changed owners a number of times. The shaft, commenced by Keltz, was sunk in after years by Brodigan to a depth of 60 ft, when the vein was found to "pinch out." Another shaft, 20 ft from this, was sunk in '64 and '65 by a San Francisco company, when, at a depth of 40 ft, the vein pinched out. The working shaft is down 220 ft, at which depth the vein is three ft thick, and showing greater permanency as work progresses. Three levels, Nos. 1, 2 and 3, with headings, respectively, 40, 70 and 80 ft north; 60, 50 and 100 south. There is a 20-stamp mill, having all the latest improvements, hoisting works, and, in the mine, a large force pump. In connection with these improvements, there is a Blondin railway. This consists of an iron car, which traverses a wire cable 800 ft in length, suspended 300 ft above the gulch, by which means the ore is transported from mine to mill. The mill is working with good results.

ITEM.—We notice on Gold hill (formerly called Piety hill), near the Rodgers' mine, that active work is going on upon the claim of Mr. J. S. Cady. A very substantial whim is being erected, and the same is being covered by a good roof. Every evidence of an energetic and active prosecution of the work of developing this promising claim is to be seen in the improvements going on. In the Rodgers, Ferguson & Co.'s mines the hoye are putting in their best licks—all "going for" the Clark, Divoll & Co.'e bonanza.

MT. JEFFERSON.—Sonora *Democrat*, Feb. 14: The sulphurets assayed at the United States mint yielded $19,800 per ton. The streak from which they were taken ie about five inches in width. That is wide enough for a fortune, if it will hold equally as rich as that assayed. Beside the streak, there is other rich ore in tbe mine.

NEVADA.

WASHOE DISTRICT.

OPHIR.—Gold Hill *News*, Feb. 13: A good etart bas been made in sinking the incline below the 2500 level. Good progress is made in the drifts east and north on the 2500 level. The former is in 64 ft, and the latter in low-grade quartz and 175 ft from the incline. The main pumps are running to this level. On the 2300 level the north drift in the Hardy vein is in low-grade quartz, its face 80 ft from the main east drift. The joint Mexican east crosscut on this level is in 37 ft. The north drift in the Hardy vein on the 2200 level has found milling ore. This came in about 70 ft from the southeast drift and still continues. The south drift in this veiu is in 45 ft. The east crosscut from the end of the north drift in the Hardy vein, 2100 level, and 40 ft beyond the stopes, continues to out a fine vein formation carrying rich ore in streaks and bunches; total length, 25 ft. A winze has been etarted 40 ft south of the main east drift on this level and in the Hardy vein to connect with the workings on the 2200 level.

SIERRA NEVADA.—The winze from tbe 2400 level, and 145 ft north of the incline has been sunk perpendicularly 46 ft, cutting 16 ft of good ore, and then turned into an incline and continued in fine ore eight ft. The north drift on the 2400 level is now in 305 ft and passing through quartz giving low assays. When the crosscut east ou the 2300 level, and 400 ft north of tbe east shaft, was in 00 ft it struck good milling ore for nine ft, tben vein porphyry.

CON. IMPERIAL.—Connection was made between tbo south drift, 2300 level, and the drift north on the 2700 level of the Yellow Jacket and good ventilation afforded on the lower levels of the mine. Running north on the 2300 level is now in order. The joint Alpha winze from the 2600 level is down 200 ft on the slope.

CHOLLAR.—The south drift on the 2400 level is in from the main west drift 160 ft. The west drift has attained a length of 670 ft and showe indications of nearing the ledge, as promising stringers of quartz bave been cut through.

UNION CON.—The main drift east from the stopes on the 2400 level has attained a length of 324 ft from the shaft. It will be a week or more before the winze can be started from its extremity for the 2500 level. The shaft will be started down at the same time. The southeast drift on this level is in from the east drift 75 ft. The drift east from the Union shaft is in 180 ft.

BELCHER.—Cutting out a station on the 2760 level for a winze to the level below. On the 3000 level, work is being shoved. A diamond drill was run 35 ft east in search of water, but the drift will now be sent in to prospect the ore vein in that direction. The south drift is in 155 ft.

CALIFORNIA.—The main south lateral drift, on the 2450 level, is in from the Ophir line 130 ft. The crosscut east on the 2250 level shows signe of approaching the ore vein encountered on the 2150 level; total length from the main lateral drift, 53 ft. On the 1500 level and in the west crosscut toward the old stopes, fino vein material le encountered.

LADY WASHINGTON.—No. 4 crosscut on the 1550 level has been pushed to the ledge. It gave low assays for over 60 ft, and then entered quartz which assayed from $17 to $30 and at the same time struck water and was stopped.

BEST & BELCHER.—East crosscut, 2150 level and joint with Con. Virginia, is cutting a soft vein formation which requires timbering; total length, 85 ft.

OVERMAN.—The crosscut east on the 1900 level has of late been cutting some very hard quartz, carrying some precious metals and looking well.

SCORPION.—Opening up the station at the 500 level, preparatory to prospecting the ledge. The sump has again cut into softer vein matter carrying some water and looking well.

CROWN POINT.—Crosscutting etill on the 2700 level joint

The Recent Experiments of Levy and Fouque'.

Some Remarks on the Study of Rock Genesis.*

[By A. W. Jackson, University of California, Berkeley.]

MM. Levy and Fouque' have recently published in the *Comptes Rendus*, Novemher, 1878, the results of their experiments on the reproduction of certain important rock-forming minerals by igneous fusion. The almost perfect success which attended their investigations, together with the important hearing of their results upon the intricate euhject of rock-genesis, induces me to give a short account of their work, which I will make the preface to eome remarks upon the study of rock-genesis in general.

Levy and Fouque' succeeded in producing, by processes of pure igneous fusion, the more important memhers of the feldspar family (with the possible exception of orthoclase), leucite, nephelite, pyroxene and magnetite, and finally mixtures of two or more of the above minerals which resemble even in their minutest detail corresponding natural products. Their firet experiments were made npon the more fusihle feldspars, oligoclase, labradorite, and albite, later upon orthoclase, microcline and anorthité. Ae materials, hoth the natural powdered feldspars and mixtnres, in definite proportions of precipitated silica, alumina, melted carhonate of potash and soda, and calcined carbonate of lime, were used, the results by both methods being identical. The materials were eimply mixed in a platinum crucible, and maintained at a temperature as little as possible below the fusion point for ahout forty-eight hours, and were then allowed to cool without further precaution. One scarcely euspected the crystalline character of the cooled mass even under the lens, hut in thin sections under the microscope the seme details, hoth of structure and arrangement, were recognizable that one meets in the natural rocks. I will give briefly the characteristic appearances which they found in the different minerals.

Oligoclase.—In microlitic crystals and fihrous, in the direction P : M, at right angles to which and normal to the brachypinacoid, is the optical normal, so that the crystale appeared dark hetween crossed Nicols when the direction of columnar development coincided with the plane of polarization of either Nicol. The crystals were mostly polysynthetic, after the Albite Law. Near the surface of the mass the crystals were very small and grouped in spherulitic aggregates, as is eometimes seen in certain massive rocks.

Labradorite.—In better crystals than oligoclase, polysynthetic like the latter, sometimes with twenty individuals entering into one polysynthetic crystal; in spherulitic aggregates, and with optical properties identical with those of the natural mineral; furthermore, glass cavities were present in abundance.

Albite.—Crystals very small, but properties entirely characteristic.

Anorthite.—Required a much higher temperature than the former, but the crystals obtained were remarkahle for their size, definiteness of form, clearness of optical properties, and natnre of inclusions. Crystals as large as 0.5 mm. by 0.2 mm. were ohtained, tahular parallel to the hrachypinacoid with extinction in the zone P : M up to 45°. The inclusions in the larger crystals were of exactly the same character as met with in nature, viz., glass cavities with buhhles, the cavities heing hoth oval in form, and as negative crystals, *i. e.*, the oavity repeating the crystalline form of the individual in which it occurs.

Orthoclase.—In no well-defined crystals, but in place of them the mass was filled with a delicate network of extremely minute crystallites, arranged in groups in such a manner that the cryetallites in each group were at right angles with each other, while the different groupe were arranged entirely irregularly with respect to one another. Each crystallite extinguished under crossed Nicols parallel to its length, and gave ite maximum of light at 45° thereto. With crossed Nicole, therefore, one could discern only a bright croee at 45° with the planes of polarization of the Nicols, whatever might be the position of the eection in its own plane. Theee crystallites could he interpreted as orthoclase, if we coneider that each is developed tahular parallel to the clinopinacoid, and eo thin ae to be unahle to depolarize light transmitted through them normal to the clinopinacoid, hut ahle to do eo in a direction parallel to this plane. The results with orthoclase can certainly not be considered so eucceesful ae with the other memhers of the feldspar family.

Nephelite.—Easily ohtained by mixing eilica, alumina and carhonate of eoda in euch proportions that the oxygen ratio of $RO : R_2O_3 : SiO_2 = 1:3:4$. The fused mase waefull of hexagonal prisms, 0.12 mm. hy 0.08 mm., eome even having the opaque central kernel eeen so often in the nephelitee of eome phonolites.

Leucite—In forms like the natnral mineral, with the characteristio optical properties, and containing glass cavities with bubhles, more frequent in the center, less frequent on the periphery of the crystals.

Mixtures of *labradorité* and *pyroxene* and of *leucite* and *pyroxene* were then fused, and the results were in the former case—a rock that resembled in the minutest microscopical detail the feldspar lavas of Ætna, so that it was ahsolutely impossihle to distinguish hetween them even in thin eections. In the latter case, the rock resembled just as closely the leucitite from Capo di Bove.

As the result of the foregoing investigation, we have certain of the most important rock-forming minerals produced for the firet time, synthetically, hy pure igneous fusion, and the synthetical production for the first time of massive rocks. Indeed, the above experiments can he looked upon as epoch-making for the science of rock-genesis, for they put it for the first time upon a true scientific basis.

In this matter of rock-genesis there are two different lines of investigation that can be brought to bear upon the euhject, viz.: *observation* and *experiment*. On the one hand, the careful examination "in place" of all of the circumstances accompanying the occurrence of any particular rock mass, its form, its contact eurface with neighhoring rock masses, changes which it may have induced in these latter, either of a mechanical or chemical nature, finally a more detailed examination of the intimate structure of the rock iteelf, as revealed by the microscope in thin sectione. On the other hand, the method by experiment, whereby we reproduce, eynthetically, by the different processes of igneous and aqueo-igneous fusion, the different minerale which participate in the formation of the rocks, and even, as we have seen in the success of Levy and Fouque', the rocke themselves.

Now I do not wish to detract in the slightest from the truly high value of these synthetical experiments in helping to unravel the mystery which for so long has eurrounded the whole matter of rock-genesis; but it seems to me that too sweeping deductions have often heen drawn from their success or failure. That they prove, when successful, the *possibility* of the formation of a certain euhstance in a given way, no one will for a moment deny. But that they prove that similar substances in nature *have been formed* in the given way must certainly be denied. Could we conduct our experiments under exactly the same conditions as we have every reason to believe often existed in nature—viz.: great heat, enormous pressure, and indefinite time—then onr experiments could he looked upon as positive arguments hearing upon the matter in hand. As it is, we never have commanded these conditions, and we can scarcely ever hope to. When successful then, our experimente can only prove the *possibility* of a certain method of action. When unsuccessful, they prove absolutely nothing.

Chemistry then can furnish ns enggestions concerning the possible processes hy which the rocke may have heen formed, which processes are then to he interpreted in the light of the phenomena observed "in place." If these speak one way, while chemistry speaks another, then certainly greateet heed must he given to the results of observation, and we must hide our time for greater certainty till chemistry can furnish results which can be hronght into harmony with the observed facts.

As you are aware, perhaps, no field of science has been the scene of more hotly contested strife than this—the genesis of the composite crystalline rocke. From the time of Werner and De Saussure, almost to the present day, the two great factions—the Neptunists and the Plutonists—have stood firmly against each other, often waging the contest with the bitterness of apparently deadly enmity. The aqueo-igneous theory has furnished a kind of middle ground that for many rocks may prove nearer the truth than either of the others. The revelations within recent years of the microscope, together with the gratifying success that has recently attended synthetical researches, are certainly throwing a great amount of light upon the questions that have been so long unsolved. It is now a fact that nearly, if not quite, all of the principal rock-forming minerals have heen produced both in the igneous and in the aqueo-igneous ways. We must betake ourselves then to the observation of the phenomena, hoth macroscopic and microecopic, which the rock preeents in its occurrence and etructure, to decide which of these theoriee is to be accepted as the true one.

It would certainly be instructive to take up each of the leading groups of the compoeite crystalline rocke and examine it in detail in the light of the reeulte referred to. Such a taek I must reserve for a future occasion however and conteut myself here with indicating, ae hriefly as poesible, some of the phenomena which throw light upon the mode in which a rock hae heen formed.

First—The *macroscopic* phenomena, or euch as are obeervahle in the field. The mechanical uptilting of adjacent horizontal heds must certainly indicate (and I am referring now only to the compoeite cryetalline rocks) that a mase has been intruded, while ahnormal contact and the inclusion of fragments of an adjacent rock must certainly indicate that the mass has been plastic. The exteneive metamorphiem of adjacent eedimentary bede ae ie observed in connection with granites, certainly euggeete the preeence of large quantities of water in the rock maes that have been discharged during the final process of solidification, for we can scarcely conceive of simple heat exercising such an influence at such great distance. Furthermore, are often formed in this metamorphic zone, hydrated minerals, although possihly of later origin, which would preclude the idea of very high temperature.

Finally, there is observed upon the contact eurfaces of other rocks the most positive evidence of a simple igneous fusion at a very high temperature—a vitrification extending not more than a few inches or a foot outward. Thie certainly pointe to an igneous fusion of the rock and the absence of any considerahle amount of water.

Second—The *microscopic* phenomena, or such as are observed in thin rock eections under the microscope. Under this head let me hriefly indicate the most important results of the microscopic investigation of rocks and the hearing of these results upon the matter in hand, viz.: rock-genesis. These are:

First—An accurate mineralogical determination of even the most compact rocke. It is certainly desireble to know *what it is* that is formed before we can speculate intelligently concerning its *mode of formation*.

Second—Concerning the structure and formation of individual granules. The *zonal structure*, often seen in feldspars, amphiboles, pyroxenes, etc., indicates successive stages of molecular activity and rest, and it has even been observed in a pyroxene crystal, where the zones were alternately brown and green, that the growth must have been at one time in the presence of oxidizing agents, and at another time in the presence of reducing agents. The *inclusions* in a crystal throw much light on its genesis. The presence of glass or stony cavities without any liquid cavities would seem to indicate that the crystal had developed out of a purely igneous fused mass. The presence of liquid and glass cavities in the same crystal suggests a process of aqueo-igneous fusion at a high temperature, while the presence of liquid cavitiee alone is evidence of the presence of a very large amount of water and not too high a temperature. Or if the temperature was high, the pressure was sufficiently great to prevent a real fusion of the rock mass. It is particularly in the granitic rocks that this last observation is made. In them, glass inclusions are never observed. I can conceive, however, of the absence of glass cavities in a granite that has, nevertheless, crystallized out from a condition of substantially igneous fusion—*i. e.*, a condition wherein the water has played a decidedly inferior role. The solidification of granite has evidently been an exceedingly slow process, because of the size the individual granules attained heforo complete solidification. The conditions would consequently he favorable for the complete assimilation of a fused magma hy the growing constituent granules, even when it constituted the greater portion of the plastic mass, while liquid inclusions would still he formed, even if hut a small amount of water were present, because of the entire absence of any tendeucy on the part of the water to assimilate directly with any one of the constituent mineral elements of the granite. When we call to mind the fact that some granites exercise a very powerful metamorphosing influence on adjacent rocks, while others exercise little, if any, it seems to me that the explanation may be found in the above suggestion.

In fluid cavities, carhonic acid and chlorides of sodium, potassium and magnesium are not infreqnently observed, proving the presence of the elements of these substances while the rock mass was melted, while the liqnid condition of the carbonic acid attests great pressure.

Third—Concerning the *growth* of crystals in an amorphous magma, *i. e.*, the study of the embryonic development, eo to speak, of crystals, both synthetically and by observing the different stages at which the crystallizing processes have been arrested, more particularly in the glassy rocks obsidian, pitchstone and the like. We have thus arrived at very valuable, and, in fact, the only sound conceptions of crystallo-genesis.

Fourth—Concerning *rock-texture*, *i. e.*, the arrangement of the mineral constituents of a rock among themselves. The observations on this head have led to a knowledge of different stages of eolidification. During the first stage certain crystals are formed and attain considerable size, the rest of the magma remaining amorphous. This takee place deep in the earth and during a period of comparative tranquillity. This period of calm ie then eucceeded hy a period of agitation, for we find the crystals broken or eaten into, ehowing powerful chemical action or a greatly increaeed temperature. The eecond etage of solidification producee a eecond crop of cryetale, which sometimee, ae in granite and allied rocks, completes the eolidification. In porphyries and volcanic rocks, however, this etage is followed hy etill a third, viz., the eolidification of the remnant of the magma as an amorphous hase. The crystals of the second stage are generally microlitic, and are probably developed during a movement of the magma; indeed, thie is often distinctly proven hy the eo-called micro-fluctuation structure.

Fifth—The microscope has shown that certain minerals, viz., lencite, tridymite, and mellilite are exclusively of tertiary and post-tertiary origin, and are never found therefore in rocke older than the tertiary.

With the aid thue of the microscope, the balance and field observation, it hae heen poeeible to ehed considerable light npon the dark places of this intricate suhject of rock-genesie. Still, even now we can feel hut tolerably certain about a few of the most general featuree of the proceesee hy which the rocks have been formed; the moet of the work in this direction belongs to the future.

*Note.—The substance of this article was presented at a recent meeting of the Chemical Section of the Academy of Sciences. It made no pretence to being a paper, but merely introduced a topic for the informatiou of the members of the section and for subsequent discussion.

Gold Discoveries in Mendocino County.

Gold was first discovered in Sanel valley hy John Knight, in 1852, from eeeing a few specks in a bucket of water from a creek near his honse, the present residence of Supervisor Fox. Thie caused him to make further search, resulting in finding the color in several placee prospected during that and the following year.

In 1854 he showed Smith D. Towne and others, from Petaluma, a emall creek coutaining gold, from which they extracted ahout $8 in a few hours. This was the year that Sam Kelsey, of Sonoma, circulated a rumor of his having found rich diggings on Russian and Eel rivers, thereby inducing a number of men to accompany him on a mining expedition through that region to Cottonwood creek, where they broke up disgusted, hating and accnsing their leader of falsehood and deception. Neither that nor any other company, within the knowledge of tbe writer, has ever prospected the Russian river region thoroughly.

The recent discovery in Sanel valley was mede hy Arthur Daw about the first of last Decemher, in a low range of hille one and one-half miles east of Hopland, on the lands of Orrin Howell. The top of this range ie ahont 180 feet above the level of the valley, and has little rills or rivulets running down its sides, that contain water only during rain etorms, consequently cannot be of any use for mining. The mineral, so far as discovered, is confined to the eastern elope of these hills, principally to the rivulets mentioned. One of these rivulets, eupposed to be the richest, has been prospected slightly with a pan and rocker to the depth of two feet, yielding from three to ten cents to the pan, out of sand and gravel from the bed of the creek.

The eoil of the hill slopes, and is of that reddish cast usually found on Russian river. The sand and gravel ie very compact and heavy, containing iron; the rocke are generally small and round, euch as miners call small boulders. There is no indication of ledges, or bedrock, on the eastern slope of the ridge, although on its top a showing of streaks of quartz mixed with other rock, may he, crops out, the top of a ledge. The gold is very fine, hut not what is called float or scale gold, and is intermixed with emall quantities of platina and iridium, with a large amount of hlack sand. Gold is found in several places over an area of two miles long by about one-third of a mile wide. A few days ago eome very good prospects were found on W. Willard'e farm.

The owners of the Hopland mine dug a ditch about two and one-half miles long, from a emall creek in the vicinity to their diggings, and turned the water into it, which was found to he sufficient for a sluice head. They now contemplate huilding a reservoir to save the water running from the dam at night for use in the daytime, which probably will give them enough to test their discovery thoroughly. The mountains surrounding Sanel valley have the same indications of mineral as the hills near Hopland, giving a strong hope of further and richer discoveries than those already made. Men who are not afraid of work might do well here; hut gassy hummers would starve to death.—*Cor. Ukiah Press.*

The Precious Metals.—From the earliest times to the commencement of the Christian era the amount of the precious metals obtained from the surface and mines of the earth is estimated to be $4,300,000,000; from the latter epoch to the discovery of America, $4,400,000,000 were ohtained; from the date of the latter event to the close of 1842, an addition of $8,500,000,000 was ohtained; the extensive working of the Russian gold mines in 1843 added to the close of 1852, $1,400,000,000 more; the quadruple discovery of the California gold mines in 1848, those of Australia in 1851, of New Zealand in 1861, and the silver mines of Nevada in 1851 added, to the close of 1879, $6,800,000,000, making a grand total at the present time of over $25,000,000,000. The average loss by ahrasion of coin is estimated at half of one per cent per annum; and the average loss by consumption in the arts, and destruction by fire and shipwreck, at $7,000,000 per annum. The amount of the precioue metals now in existence ie estimated to he $13,000,000,000, of which gold furnishes $8,000,000,000, and silver the remainder. Of the amount now in existence, $9,000,000,000 are estimated to he in coin and hullion, $3.000,000,000 in watches, and the remainder in plate, jewelry and ornamente. Of the amount now in existence, $8,000,000,000 are estimated to have heen obtained from America, $2,000,000,000 from Asia (including Australia and New Zealand), $2,000,000,000 from Europe, and the remainder from Africa and Oceanica.—*D. M. Balfour, in New York Economist.*

Gold Yield of New Zealand in December, 1879.—The number of tons of ore crushed during the year wae 2,611; ouncee of gold ohtained, 7,764. The product for the past four yeare ie:

	ozs.	Value.
Gold yield for 1876	68,519	£160,027
" " 1877	132,370	£364,017
" " 1878	60,602	£166,655
" " 1879	49,853	£130,000

Light Yields.—The product of the principal minee in Nevada county for Decemher were lighter than usual, as follows: Idaho, quartz, $29,600; Milton, gravel, $21,500; North Bloomfield, gravel, $30,000; Pitteburg, quartz, $4,300.

Coal Trade of Seattle, W. T.

The Seattle *Intelligencer* makes this report for 1879:

January	10,932 tons.
February	11,319 "
March	12,912 "
April	14,397 "
May	13,176 "
June	9,870 "
July	8,297 "
August	6,011 "
September	14,372 "
October	9,898 "
November	12,332 "
December	8,747 "
Total	132,263 tons.

All this coal went to San Francisco except that of a single small vessel (the bark *Gem of the Ocean*) which went to the bottom of the sea. All of it also, as was likewise the case in 1878, came from the mine of the Seattle coal company at Newcastle. The coal trade of Seattle has attained its enormous proportions in less than nine years, and against obstacles of a more stupendous character than have been encountered at any other place on the coast. In 1871 the first coal for export and trade was placed on board ship in this harbor, and during the ensuing four years what were in those days considerable quantities followed, reaching tidewater in scows and over wooden tramways, and by river and lake and portage and what all only those engaged in the transportation have anything like an accurate idea. To give our readers an idea of how the industry has been pushed, from the beginning to the present time, we subjoin the following table:

1871	4,918 tons.
1872	14,830 "
1873	13,572 "
1874	9,027 "
1875	70,157 "
1876	112,734 "
1877	104,556 "
1878	128,582 "
1879	132,264 "
Total	590,639 tons.

Of this immense quantity sent abroad by ship, 33,419 tons were from the Renton mine, 23,426 tons were from the Talbot mine, and all the rest (533,794) was from the Seattle mine. Of the coal above referred to all but ten or fifteen thousand tons went to the bay of San Francisco. A few small cargoes went to Honolulu and the southern coast of California, and a few more (those of the ill-fated *Osmyn, Western Shore*, etc.) were lost in the ocean. The future of Seattle's coal trade can only be conjectured. We may rely upon one thing, however, and that is, as the demand increases our mines will be ready with the supply. We have several varieties of coal within our county limits, and a quantity that can not be estimated short of hundreds of millions of tons.

The Longfellow Copper Mines.

We extract from the Globe (Arizona), *Silver Belt*, the following interesting statement: Mr. Wendt, a practical miner, and mining engineer of New York, visited the mine a few weeks since, and after a careful examination, at a low estimate, placed the amount of ore actually in sight at 50,000 tons, averaging 25% with a reasonable calculation of finding as much more by displacing that already exposed. With these figures we deduce the following: Fifty thousand tons of 25% ore will yield 12,500 tons of copper or 25,000,000 pounds and at the present price of copper, 23 cents, $5,650,000. The company expect this year to produce 4,500,000 pounds of pig copper, which, at the above rate, will give $1,035,000; hence, it is clearly to be seen that the Longfellow is not only a wonder, but is one of the most productive and best paying mines of America.

The company employ directly about 500 men, and indirectly, including charcoal burners, freighters, etc., 1,000, in all about 1,500, and the operations of this one mine alone give daily bread to over 2,500 people.

There is in transit to the railroad over one half million pounds of copper from this mine, and two freight wagons are daily loaded at the furnace, with 8,000 pounds, which amount it is the intention of the company to increase to 12,000 or 15,000 pounds. Eight thousand pounds of copper per day, with the enormous amount of merchandise sold by the company, net to it over $1,000 per day. Mr. Wendt gives it as his opinion, that the mine is a true fissure vein, and that the heavy body of ore is to come from below.

The Longfellow company have built and stocked a narrow-gauge 20-inch railroad nearly five miles in length from the mine to the furnace, at a cost of about $75,000. It is complete in every particular, with the exception of an engine, which has been ordered and will be on the road in a few weeks. The rolling stock at present consists of eight cars of three tons capacity each, and are hauled by mules from the furnace to the foot of the mountain, where the ore is lowered from the mine by means of a tramway 1,600 feet, and a chute 480 feet. From here the grade of the road is sufficiently descending to carry the train back to the furnace of its own specific weight.

A Canadian Gold Mine.—A bar of gold weighing 235 ounces, valued at about $4,600, from the Skerry & Kennedy ledge, at Montague, is the result of three weeks' work of 14 men.

Useful Information.

Hardening and Testing.—To *really test* the hardness of the surface of metal, we must take a *new*, or at least a good, *dead smooth* file and apply one corner of it to a corner rather than on a flat surface of the metal to be tested, pressing the file very firmly against the work. A coarse file, even if a new one, is useless to test with. The greatest degree of hardness is obtained by plunging the red-hot steel into mercury. Steel hardened from the surface inward is hardest on the surface, while in steel that has been tempered the exterior is the softest. In the one case because the surface was cooled in advance, in the other because it was heated in advance. Files are hardened in the following mixture: 2 parts (by weight) of salt, 15 parts of rye grist, and 30 parts of burnt cow hoofs, all ground together and mixed with a sufficient quantity of water to make a pasty mass, with which the files are covered. When dry, they are placed in a fire. If, during the heating, the coating should drop off at certain places, the files are promptly withdrawn and the place exposed is covered with dry hoof powder. It is returned to the fire, where it is left until a temperature is reached which best suits the steel of which it is made. Then the file is plunged vertically into the bath, care being taken not to move them to the right or left, as that would cause warping. The bath is made in the following manner: 28 parts of salt are dissolved in about 5 parts of water, to which a handful of iron scale is added. The tangs are softened by being plunged into red-hot lead.

Shop Cleanliness.—The clear thinking founder of Methodism said that "cleanliness is next to godliness," and if the axiom is not the basis of Methodism it is the basis of method. If there is anything that collects dirt—attracts dirt—faster than a tramp, it is machinery, and it is the worst of the ill usage that limits the life of machinery. Some time ago the management of a certain railroad ordered a cessation of the cleaning of its locomotives, with a view to save the cotton waste, labor and time used. The experiment was not successful. There is no machine from a locomotive to a watch, but needs occasional cleaning. Dirt interferes with motion and destroys material. It is a constant annoyance to the workman in the shop as well as the woman in the house. But in the shop there is danger added to annoyance. The danger arises from the presence of heaps of refuse, iron and steel chips and shavings, oil and waste, either of them inflammable alone, and combined are the source of more than one "incendiary" fire. Under favorable conditions—heat and moisture—a heap of chips from the machine shop will generate hydrogen gas in sufficient quantities to take fire when mixed with atmospheric air. Of course, the oil and fragments make a perfect tinder box of such debris. The shop sweepings should be placed under cover away from valuable property, and the shop and its tools should be kept clean if for no other reason than that of comfort.—*Ex.*

Vermin Riddance.—Half an ounce of soap boiled in a pint of water, and put on with a brush while boiling hot, infallibly destroys the bugs and their eggs. Flies are driven out of a room by hanging up a bunch of the Plantain, or Fleawort plant, after it has been dipped in milk. Rats and mice speedily disappear by mixing equal quantities of strong cheese and powdered squills; they devour this mixture with great greediness, while it is innocuous to man. When it is remembered how many persons have lost their lives by swallowing, in mistake, mixtures of strychnine, ratsbane, corrosive sublimate, which are commonly employed for this purpose, it becomes a matter of humanity to publish these items. House ants ravenously devour the kernels of walnuts, and shellbarks or hickory nuts. Crack some of these, and place them on a plate near the infested places, and when the plate is full of the ants, throw the contents in the fire. Cockroaches, as well as ants, are driven away by strewing elderberry leaves on the shelves and other places frequented by these troublesome insects.

Court Plaster.—Soak isinglass in a little warm water for 24 hours; then evaporate nearly all the water by gentle heat; dissolve the residue in a little dilute alcohol, and strain the whole through a piece of open linen. The strained mass should be a stiff jelly when cold. Now stretch a piece of silk or sarsenet on a wooden frame, and fix it tight with tacks or pack thread. Melt the jelly, and apply it to the silk thinly and evenly with a badger-hair brush. A second coating must be applied when the first has dried. When both are dry, apply over the whole surface two or three coatings of balsam of Peru. Plaster thus made is very pliable, and never breaks.

To Restore Old Oil-Paintings.—Take the painting out of the frame, lay it on a table, face up, and keep a wet cloth on it for two or three days, changing or cleaning the cloth as often as it becomes soiled. When the painting is clean, wash it with a sponge or brush dipped in nut-oil. This is much better than varnishing.

To Harden Malleable Iron.—Mix equal parts of common potash, saltpeter and sulphate of zinc, and use as directed for prussiate of potash.

American Joinery in England.—The first shipment to England of machine-made doors, window sashes, window blinds and similar articles of joinery took place in 1877, and although confined to doors for the cheaper class of houses, the goods at once met with a demand that justified the expectations of the shippers. For the first time, in 1877, some 19,000 doors and 6,284 pairs of sashes and blinds were shipped from New York to England, the greater part of which went thence to Australia and New Zealand. The shipment of doors to England and Scotland in 1878 was about 45,000, as against 2,800 in 1877. Up to June of the present year these shipments show a slight increase, but the total for the year will be much larger, as a single steamer carried out to England 45,000 American doors.

A Good Blacking.—A superior article is made by the following formula, which has been long in use: Mix intimately one pound of molasses, one pound of best bone-black in *very* fine powder, and one-quarter pound of olive oil; then add one-quarter pound of sulphuric acid, previously diluted with one-quarter pound of water. The whole is allowed to stand for three hours or longer, and afterwards as much water is added as is necessary to give it the proper consistency.

It has been going the rounds of the mechanical journals that iron gets shorter if heated red-hot and cooled in water, while steel gets longer if similarly treated. I have reason to believe that this is erroneous, and that both iron and steel may be made to get either longer or shorter at will. If this is the case, it can be made of very great importance to machinists, and I hope to shortly lay before your readers some experiments made to solve the question.—*Joshua Rose, M. E.*

Etching on Glass.—Etching on glass is performed by laying on the glass a ground of beeswax, and drawing the design thereon with the needle, as in etching upon copper. Sulphuric acid is then poured on, and fluor spar sprinkled on it. After four or five hours it is taken off, and the work cleaned with oil of turpentine.

Remedy for Corns.—Mr. Gezow, a Russian apothecary, recommends the following as a "sure" remedy for corns, stating that it proves effective within a short time, and without causing any pain: Salicylic acid, 30 parts; extract of cannabis indica, 5 parts; collodion, 240 parts. To be applied by means of a camel's hair pencil.

To Remove Glass Stoppers.—To move a tight glass stopper, hold the neck of the bottle to a flame, or take two turns of a string and seesaw it. The heat engendered expands the neck of the bottle before the expansion reaches the stopper.

Good Health.

Spring Complaints.

We eat about one-third more in winter than in summer, because we not only have to repair the wear and waste of the system, but we eat to keep the body warm, a portion of the food is converted into fuel; we must keep a bodily warmth of 90° or 100° winter and summer, but it is easy to understand, that, as the thermometer is at 40 in winter and 80 in summer, less fuel is required to sustain the natural temperature in warm weather; if yet, in defiance of this, we pile on the fuel, a wreck and ruin is as inevitable as the blowing up of a steam engine, if double the necessary quantity of steam is constantly generated.

For a while after the opening of spring, we have the appetite of winter, and not using our knowledge, we indulge it as extensively; and thus generating more heat than is needed, we soon begin to think "we are feverish," in other words, we are too warm, but instead of making less fire, we begin to tear down the walls of our bodily-house, by taking off our winter clothing, and thus add another cause of disease and death. In a short time, however, nature comes to our aid, and to save us, takes away our appetite; but we, taking this as an evidence of declining health, decide upon one of two things; either to eat without an appetite—which is expressively denominated as *"forcing it down"*—or we decide upon taking a tonic, forgetting that nature can neither be forced nor coaxed with impunity. The effect of eating without an appetite, or forcing an appetite by the use of tonics, is the same, that is, the introduction of more food into the stomach than nature requires, than there is juice to digest it; for, although you may take a tonic which whets the appetite, it does no more; it does not increase the amount of gastric juice, for nature supplies it only in proportion to the needs of the system, and if she gave as much when 20° of heat were required as when 60° were necessary, she would commit a great blunder—this she never does, when unmolested. Then we have more food in the stomach than there is gastric juice for; more wheat than there are mills to grind it; more work than there are workmen to perform. But nature has not "a lazy bone in her," but goes to work to do the best she can; the food is digested, but not thoroughly; it is ground up, but not perfectly; the work is done, but it is badly done; hence an imperfect material for making blood is furnished; and an impure blood, an imperfect blood, is inevitable. The best remedy for spring diseases of whatever name, is—*eat less.—Journal of Health.*

Leprosy in America.—The *Commonwealth* in a late issue remarks: "The medical journals see danger ahead from the leprosy which has been introduced into this country. Quite a number of unmistakable cases have been reported from the Southern States, and the disease is disagreably common among the Chinese in California. On the coast of New Brunswick there are several colonies of lepers. Physicians who have had good opportunities of investigating the character of the disease are of the opinion that it is contagious in the full sense of the term. It is nearly sure to spread to the same extent that leprous subjects freely associate with uncontaminated persons. Some salubrious little island in the Gulf of Mexico ought to be set apart for these unfortunate people, to which every new case of leprosy should be promptly transported. Immediate and complete isolation has always, from the most ancient periods, been held to be the only safe way of treating the loathsome complaint."

Care of Children.—Every mother should know that very young children often suffer for the want of fresh, cold water. This they should have every two hours, and more frequently, if they become restless and fretful. Fretfulness is generally caused by great thirst. While making a voyage at sea some years ago, I was greatly disturbed by the incessant crying, or moaning of a child, during the first few days of the journey. The child was about one year old and very delicate. I suggested to the mother that it wanted water. She said that it never, to her knowledge, tasted water, as she thought it dangerous to give to children so young. I assured her she need have no fear. I directed that it should have water every hour, a little at a time, until it became accustomed to it. This was given it, and during the rest of the voyage, of five or six days, I never saw a better or happier child. I believe the child's health was permanently impaired by the constant thirst that during its short life had been consuming it.

Calomel in Tomatoes.—An old subscriber and friend writes us that a celebrated French chemist and physician, who has analyzed tomatoes declares that they contain all the elements of calomel, and he has known them to salivate persons. She wishes our opinion on this subject, and we have only to say that this idea has been going the rounds of the press for more than 30 years. It is a falsehood from beginning to end. The idea that they produce salivation may possibly have originated from the fact that, eaten in large quantities by some persons, the acid of the fruit seems to irritate those parts of the mouth with which it comes in contact. The idea that tomatoes cause cancer, is another superstition, the outgrowth of the former notion that tomatoes were unfit to eat. They cause neither cancer nor salivation, and may be eaten with impunity by most persons, and often with great benefit.—*Herald of Health.*

Weak and Flabby Muscles.—Another lady subscriber asks us what can be done to restore muscles that become weak and flabby. To which we reply: If this condition is simply a result of disuse of the muscles, or want of exercise, then the remedy is careful and systematic physical exercise of the weak and flabby parts. Persons who lead an inactive or sedentary life are very apt to have weak and flabby muscles. The kind of exercise required to restore them depends somewhat upon the physical condition of the person. The various kinds of labor to be done about the house are good in their place, but we are very apt to do our work with the strongest muscles, and save the weaker from anything that strains them, consequently they have to be treated by special exercise, by rubbing, gymnastics, electricity, etc. All tight clothing or pressure upon weak muscles only makes the matter worse.—*Herald of Health.*

Personal Habits and Health.—The importance of personal habits as affecting health can hardly be over-estimated. Hundreds of cases can be cited of noted persons of the most feeble constitution who by care were able to prolong their lives and accomplish wonderful labors in spite of almost continuous illness. The Jews are said to be the longest-lived people, because of their strict attention to hygiene as directed in the Mosaic law. If a man by taking thought cannot add a cubit to his stature, he may at least lengthen his days very materially by prudence. Any one can prolong his or her life beyond the average term of years by simple attention to hygienic laws.

New Preventive Against Scurvy.—In reporting the reception of Prof. Nordenskjold and the staff of the *Vega* at Nagasaki, the correspondent of the *North China Herald* notes that there was not a single case of scurvy during the whole voyage. This, he learns, was owing to the free use of a curious little herry that springs out of the eternal ice and snow during the short summer; it bears profusely and has a taste like the raspberry, but more acid. The fruit is dried and then mixed with the milk of the reindeer, and it can be carried in a frozen state for thousands of miles. There was also used a curious kind of food made from the whale's hide, which is pickled and eaten freely during the winter.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Nesded Reforms in Mining Matters; Prescott, Scott & Co.'s Horizontal Boilers; Placer County Quartz Mines; California Trademarks and Labels, 113. The Week; The Gravel Mines of Forest Hill, Placer County; The Skagit Mines, 120. Appliances for Silk Reeling; Academy of Sciences; Legislative Matters, 121. Notices of Recent Patents, 124.

ILLUSTRATIONS.—Horizontal Boilers, with Internal Furnace and Return Tubes, 113. Appliances for Silk Reeling, 121.

CORRESPONDENCE.—Manufacture of Copper, 114 The Hofmann Process, 124.

MECHANICAL PROGRESS.—Putting up Shafting; Hardening and Tempering at One Operation; The Transmission of Motive Power by Electricity, 115.

SCIENTIFIC PROGRESS.—Why the Sky Appears Blue; On the Probable Temperature of the Primordial Ocean of our Globe; A Mineralized Fossil; Difficulties in Surveying; Earthquakes and the Planets, 115.

MINING STOCK MARKET.—Sales at the San Francisco, California and Pacific Stock Boards, Notices of Assessments, Meetings and Dividends, 116.

MINING SUMMARY from the various counties of California, Nevada and Arizona, 117-124.

USEFUL INFORMATION.—Hardening and Testing; Soap Cleanliness; Vermin Riddance; Court Plaster; American Joinery in England; A Good Blacking, 117.

GOOD HEALTH.—Spring Complaints; Leprosy in America; Care of Children; Calomel in Tomatoes; Weak and Flabby Muscles; Personal Habits and Health; New Preventive Against Scurvy, 119

MISCELLANEOUS.—Mineral Ranges of Beaver County, Utah; Changes in Plant Life on the San Francisco Peninsula; Copper Mines of Winnemucca District, Nevada, 114. The Recent Experiments of Levy and Fouque; Gold Discoveries in Mendocino County; The Precious Metals, 118. Coal Trade of Seattle, W. T.; The Longfellow Copper Mines, 119.

The Archer Patent Invalid Bed, Jas. H. Archer, Prop.
Situation Wanted—Charles Brockelsby, Goleta, Cal.
Delinquent Notice—Rocky Point Mining Co.

The Week.

The principal local feature of the past week has been the final passage and signature of the law preventing the employment of Chinese by corporations in California. The woolen mills, the jute factory and several mining companies have already discharged their Chinese employees in compliance with the law. The worst feature of the matter is that these companies have also discharged their white workmen, with a view of shutting down work entirely, stating that they cannot compete with similar branches of manufacture elsewhere at present prices of white labor. Meantime there are many idle men in the city in search of employment. The doubt as to the construction of many provisions of the new Constitution of the State, and the uncertainty with relation to pending measures before the Legislature is having an injurious effect upon business, which is comparatively dull in all branches.

The cold weather ie, for the time at least, over, and a good, heavy, but rather cold rain has visited us. This rain was much needed, and it ie to be hoped we will yet have more of it.

Among mining men the question of the hour ie the probable transfer of the mining stock business from San Francisco to New York. Capital centered there has already been largely invested in mining operations, and many of those persons intimately connected with the business here have gone across the continent to the more lively field. The stock market here is duller and duller as week succeeds week, and the Legislature is assisting rapidly in killing the business by the bills restricting dealings in mining stocks.

. In New York Government bonds are quoted at 106¾ for 4s of 1907; 103½ for 5s of 1881; 109½ for 4½s; sterling, $4.84@$4.86½; silver bare, 113½; silver coin, ¼ discount buying, par selling.

The Gravel Mines of Forest Hill, Placer County.

These mines were all opened at about the same time in 1853 and 1854. They are located on the divide between the North and Middle forks of the American river and very nearly in the geographical center of the county. The claims are located on one of the ancient river channels, or blue-gravel leads as they are sometimes called. The channel has a course running generally from northeast to southwest. The deepest line of depression in the bedrock is on the southeast side of the divide and nearly parallel to it. The rim rock disappearing, this depression comes to the surface near the lower end of the Dardanelles, turns there at about a right angle and strikes into the hill. The surface of the bedrock is undulating across, but seems to be in falls and benches with the divide. The deposit of gravel, cement, volcanic wash, etc., is about 450 feet thick where deepest and from 2,000 to 5,000 feet wide. The claims were all opened by drifting, and most of them have proved immensely rich, $800,000 being taken out from about a half acre of ground. Over $2,000,000 was taken out of the Dardanelles before hydraulicing was commenced. This mine took a premium at the State fair of 1860 as the best drifting claim in the State. Only the bedrock gravel was taken out by drifting, and it was not until about 1868 that hydraulicing was commenced in some of the claims. Since then their prospects have been continually improving, until to-day they are considered among the best of Placer county.

The Forest Hill mines proper are those comprised between the Rough & Ready on the east and the Big Spring on the west. Beyond the Rough & Ready are the noted mines of Bath and Michigan Bluffs on the same gravel deposit. Lower down below the Big Spring and in Todd's valley, ie located Pond & Co.'s claim, which has been hydrauliced since 1854. Of the nine claims within these limits only three are as yet hydrauliced—the Pemberton, Dardanelles and Big Spring. Of the others but little can be said.

The Rough & Ready has yielded much gold, but is at present idle. The Jersey claim adjoins the Rough & Ready on the west. The southeast portion has all been drifted out. It yielded $1,500,000. Prospecting is at present going on in that portion of the claim which was not reached by the old tunnels.

The Mountain and Baltimore claims come next. The Mountain worked through its own tunnel produced a large amount of gold. New ground is being prospected through the Baltimore tunnel. This tunnel runs 2,600 feet into the hill. In the Baltimore at present only prospecting work is going on. It is owned by Alvinza Hayward.

The Hope claim with a frontage of 500 feet on the Middle fork is perhaps the most important of the smaller mines. It has a tunnel running in 1,800 feet. The gravel is struck 125 feet from the entrance, and continues for 350 feet when it pitches up. At a distance of 450 feet from the mouth a drift runs off to the east 300 feet in the channel. Rich gravel has been taken out and prospecting going on now is showing favorably. But a small portion of the gravel available for drifting has been taken out. As the whole claim from the surface down prospects well, it will be worked by hydraulicing. The owner is S. G. Phillips, of Auburn.

A small claim, known as the Unkle Sam, comes between the Hope and Pemberton mines. Some gravel has been sluiced off the face and most of the channel has been worked out through bedrock tunnels. It is not worked at present.

The hydraulic mines before mentioned are of far greater importance, and the more they are opened the richer they prove.

The Pemberton Mine.

This mine is owned by an incorporated company, and consists of the old Green Spring claim. Most of the stock is owned in Boston, though some local capitalists are interested. The mine has 600 feet front on the Middle fork, and covers 60 acres of the Divide, all of which can be hydrauliced. About 25,000 cubic yards of gravel have been washed off, principally before the mine became the property of the Pemberton company. Although only top gravel, and washed by very imperfect appliances, it paid largely. The mine was opened for prospecting and drifting by a bedrock tunnel run in 1852. At 350 feet from the entrance it strikes the front channel, which on the tunnel level is 150 feet wide. The gravel in the channel below the level of the tunnel is as yet untouched.

Water is obtained from Pond's lower ditch, 600 inches being all that is used at present. It is carried through 22-inch pipe, 2,000 feet from the sand box to the giant. This line of pipe crosses two depressions of 350 and 100 feet respectively. The company have one No. 4 giant with a five-inch nozzle. Instead of an outlet tunnel, an open cut 40 feet deep has been made through the rim rock. The company have 1,200 feet of sluice boxes three feet wide and two feet deep, well lined and blocked. In the line of the boxes are eleven drops and six undercurrents. These latter are constructed in the most thorough manner. The tailings are run into the Oro canyon and pass through the tail sluices of the Dardanelles company before being dumped into the river.

The mine has just been fitted up preparatory to commencing active operations. The gravel is similar in every respect to that of the adjoining Oro claim belonging to the Dardanelles company. So promising are all the indications, that as soon as the mine is more fully opened and the washing facilities correspondingly increased, it will without doubt be one of the most profitable on the Divide.

Dardanelles Consolidated Gravel Mine.

This large and valuable property is owned by an incorporated company. The mining ground consists of the old Dardanelles and Oro claims, having a frontage of about 2,000 feet on the Middle fork, and running back to Devil's canyon, comprising some 312 acres of patented mineral land. The company also own the Zeta and Pei claims, containing 320 acres and adjoining the famous Paragon mine of Bath.

The water used is brought from Shirt-tail canyon, a tributary of the North fork, by the Miners' ditch, 17 miles long and carrying 4,000 inches. This ditch, and the Freeman ditch, capacity 500 inches, are owned by the Dardanelles company. In addition to supplying all the water used by their own mines, the Miners' ditch furnishes water to the mines of the Brushy and Yankee Jim's districts.

Three No. 6 giants are used, with nozzle orifices of 7, 7½ and 8 inches respectively. The water comes from the sand box under about 300 feet head to each giant by a string of 22-inch pipe, and the water used running under full head is from 1,200 to 1,700 inches to each pipe.

Three outlet tunnels carry the washed gravel through the rim rock and into the Dardanelles canyon. The sluice boxes are 4 and 4½ feet wide. In the canyon are 10 undercurrents from 12 to 24 feet wide, and another 24 feet wide will soon be added. The canyon is 1⅞ miles long, and has 1,800 feet fall to the river. The gravel, though very strongly cemented in the mine, is thoroughly disintegrated before it reaches the river and nearly all of the gold caught. Into this canyon also run the tailings of the Big Spring and Pemberton hydraulic mines and the drifting claims.

The bank of gravel has been washed through nearly the entire width of the mine. In the Dardanelles or western part of the mine, the washing has gone on till the face of the present bank is nearly 300 feet high. In the Oro consideraably less gravel has been moved. In all over 7,000,000 cubic yards have been sluiced off, and the mine is now in such condition that 2,500,000 cubic yards will be washed this winter. The gravel being strongly cemented, bank blasting is indispensable to break it up before washing. Some very large blasts have been exploded in this mine, one of 36,000 pounds of powder. Judson powder manufactured by the Giant Powder Company is the only explosive used, experience having shown its superiority to any other kind for bank blasting. For drifting the company have a bedrock tunnel near the western boundary of the mine where the gravel is overlaid by a bed of cement. Drifting in this tunnel was resumed about six months ago for the first time since 1868. Extremely rich gravel is now being taken out. Part of the gravel pays well for drifting 30 feet above the bedrock. From 30 to 50 men are constantly employed.

The Big Spring Mine.

This claim has a frontage of 1,000 feet, and extends back 5,000 feet. The bedrock is much higher than in the adjoining Dardanelles, and slopes, at least in the eastern part of the mine, towards it. The water used, 500 inches, comes from Pond's upper ditch. A string of 11-inch pipe takes the water under 275 feet pressure to a No. 3 giant with a 5-inch nozzle. The mine has 350 feet of sluice boxes and one undercurrent. The tailings are discharged into the Dardanelles canyon.

Piping was commenced about two years ago, on the eastern third of the claim working from the rim rock inward. As yet no large body of gravel has been struck, the mass of the hill here being cement or other barren ground. The bedrock streak of gravel is, however, very rich, and is getting thicker as they wash further inward. It is claimed that the western part of the mine is richer than the portion now being washed. The deposits prospected through two tunnels, one in their own ground, the other branching off from the Dardanelles tunnel and running much further in. By drifting from the latter large amounts of gold were taken out in early days, and the present owners intend to resume work in it shortly. The owners are Messrs. Pecht, May and Neumann of Forest Hill, all being practical miners.

Sacramento Foundry Work.—Root, Neilson & Co., of the Union Iron Works of Sacramento, are at present engaged in constructing a five-stamp mill for the Bullion mining company of Paradise valley, Nev., and also completing a five-stamp mill, with pans, settlers, etc., for the Gold Mountain mine, Amador county, Cal. They recently shipped a large and complete mill to a mine in Arizona. The works are engaged in a good variety of job work, and being the oldest established foundry in Sacramento, have a steadily increasing trade. Their position, near the Northern mines, is of advantage to them. We are pleased to note the successful progress of this foundry.

Roumanian independence will be recognized by England, France and Germany in a few days.

The Skagit Mines.

The latest thing in the way of an "excitement" is that concerning the Skagit mines, and there is a strong probability of a rush there when the spring opens. At present the cold weather has practically closed the mines down. There seems to be considerable difference of opinion as to the best route to the mines, and several trails are being opened. The new road from Whatcom to Skagit gold fields is being rapidly pushed forward, and will probably be open for travel about the middle of April, as the snow will hardly disappear before that time. This is called the Chillawhack route, and is said to be shorter than the Hope trail by ten miles. Passengers can reach Whatcom from Port Townsend by water, in four hours, and the gold fields can be reached entirely by land, excepting the passage across Summit lake, seven miles wide, which will be navigable at all times. Timely notice of the opening of this road will be given, so that miners from California may not be induced to start earlier than necessary. The snow in the diggings in the early of this month was about five feet.

The distances to the mines by the Seattle route are as follows: From Seattle to the mouth of Skagit river (by boat), 55 miles; from the river mouth to Mt. Vernon, 11 miles; from there to the head of steamboat navigation, 64 miles; from there to Godell's place, by canoe, 7 miles; from the portage into Ruby creek, by trail, 30 miles. Total distance from Seattle to Ruby creek, by water and Skagit trail, 167 miles.

A gentleman in Virginia City received a letter from a friend at the Skagit mines, extracts from which are published in the *Enterprise*. The writer says that the diggings were discovered by a party of five prospectors in July, 1878. They are on what is called Ruby creek, a stream about six miles in length, and on which claims have been taken up for a distance of two or three miles. Claims are now 250 feet front, but there is talk of cutting them down. On the east side of the Skagit there is a region of country some 20 miles in length which has as yet been but little prospected, though some of the streams have been found to be rich in gold.

At the time the letter was written, February 3d, there was but 75 men in the diggings. Bedrock had nowhere been reached in the creeks. Water is everywhere abundant—"too much so," says the writer. The summers are warm and the winters not cold, though this winter has been an exception, as they had five feet of snow.

The trip from Seattle to Godell's, at the head of canoe navigation, including passage per steamer and canoe, costs but $12 each men—fare per steamer $5, and special arrangement made with Indians for about $7 per man. The distance can be made in about eighteen hours, stopping at every camp on the route for the purpose of receiving and depositing freight and passengers.

From what the writer says there appears to be a vast region of country to the northward of where mining is now being done about which nothing is known. It is a new and unexplored region.

Canyon creek is another place in the same vicinity, which is being worked by a few miners. It seems difficult to obtain any authentic information or particulars of yield of dirt, character of diggings, etc. We have nowhere seen mention of the amount per day to be obtained by pan or rocker on the average. No doubt as spring approaches additional particulars on these points will be forthcoming. In view of the general prevalent dullness many men will go, and the country about the Skagit diggings will be pretty thoroughly prospected during the coming summer.

Reduction in R. R. Fares Between S. F. and the East.—The question of reduction of fares between the East and this city is being mooted by the leading railroad companies there, and the C. P. R. R. and U. P. R. R. Nothing definite has been determined as yet. The C. P. R. R. has on its own responsibility taken the initiative in this direction by reducing the fare in third-class cars from San Francisco to New York to $35, on two days named in their advertisement. As a still further inducement, sleeping berths will be provided to Ogden free. It is to be hoped that this experiment will be so successful that the reduction will be continued, and also extended proportionately to all other grades of passenger fare. We understand that the Union Pacific have notified the Western railroad managers' meeting at Chicago that their proposition respecting pro rata per mile ticket from San Francisco to New York, with a rebate at New York, was not accepted, and that arrangements had been made with the Pennsylvania road to carry Western passengers via St. Louis. Chicago roads will attempt to interfere with this plan.

The San Francisco Copper Mine and Reduction Works, located at Spenceville, Nevada county, discharged 26 Chinese workmen employed by them. The company intends sending to Spain for white laborers to supply the places of the discharged Chinese, representing that the work is of too unhealthy a character for persons unaccustomed to it to undertake it.

Appliances for Silk Reeling.

Now that silk "family style" is the plan upon which believers in sericulture are urging the industry upon the attention of the public, it will be interesting to show some of the appliances used in reeling silk by the hand method. It must be premised that in France the hand reels have been well nigh superseded by the "filatures" or establishments in which reeling by steam power is carried on. And it has been claimed on good ground no doubt that the rate of wages in this country wholly precludes hand reeling, except it be in the handling of silk in the family and by the labor of the inmates of the home, something as the old time spinning of flax and woolen yarn was done. Whether the industry will ever come to anything on this basis is a problem akin to the question as to whether we shall ever make our own tea by home drying of leaves of garden-grown plants. In order, however, to aid in the work of drawing public attention to the proposition, so that its possibilities may be weighed in the general judgment, we have chosen to illustrate the hand reeling of silk and describe the process and appliances employed.

We are enabled to do this with the assistance of a work lately issued by Gen. Le Duc, Commissioner of Agriculture, being the report by Prof. C. V. Riley of a special investigation he made concerning the adaptations of this country to silk culture. From this source we draw the information which we present, as follows:

If the mere rearing of the worm and the production of the cocoons is simple, the reeling of the silk is by no means so, as the greatest skill is required to accomplish the work properly, and the value of a hank of silk depends as much on the skill of the reeler as upon the quality of the original thread.

The thread of silk as it unwinds from the cocoon is valueless for manufacturing purposes, several of them combined going to make the staple of commerce. The persons employed in unwinding silk are mostly women, one standing or sitting before each basin, of which she has entire charge. The basin is made of copper, and, in the large establishments, the water in each basin is heated by steam, at the control of the operator. The cocoons are plunged into the water, when it is near the boiling point, and moved about so that the gum which fastens the threads becomes uniformly and thoroughly softened. They are then beaten with a small birchen broom, having the tips split, so that the loose threads readily fasten to them. After heating a short time, the operator gets the cocoons fastened, and, taking the bundle of threads, shakes the cocoons till each hangs but by a single one. She now takes up five or more threads, according to the quality of the silk wanted, unites them, and introduces the combined staple or strand into a little glass eye on one side of the basin. She then forms a second similar strand and introduces it into a second eye on the other side. The strands are then brought together, twisted several times, seperated above the twist, and introduced into two other glass eyes or ringlets through which they are led, one to each end of the reel or *tambour*, which is kept revolving in a steady, rapid manner, and to which is also given a certain heck and forth side motion. The great object in reeling is to get the threads uniform, rounded, well joined, properly freed from moisture, and so crossed on the reel that they will not stick or glaze, as it is termed. These objects are attained by the twisting and the to and fro lateral movement of the reel, as also by properly regulating the distance between reel and basin. The uniformity of the thread depends on the skill of the operator, who must supply a new thread as soon as one begins to give out.

In order to better illustrate these principles, we have introduced figures of three reels. Fig. 1 is the old Piedmontese reel, which for many years holds its supremacy, and which has been the foundation of numerous improved reels. It is formed of four bars or arms, and is usually about a yard in circumference. One of these bars is provided with hinges so that it may fold inwards towards the center when it becomes necessary to slacken the silk in order to carefully remove it from the reel. The lateral movements so necessary in order that the consecutive circles shall not stick together is gained in rather a clumsy manner by means of cogs. The strands, after being twisted several times at *c*, in order to round and smooth the thread by friction, are passed over the guides *b b*, which are inserted in the traversing bar *a*. To this bar the lateral movement is imparted by a pin connected with the outer circumference of the cog-wheel *d*. This is connected at *e* with the cog revolving with the shaft of the reel. *f* represents a charcoal furnace under the copper basin *g*. The cross-bar *h*, to which are attached the glass eyes through which the thread from the cocoons first pass, is usually widened into a shelf, upon which to place the broom and the cold water for the reeler's fingers.

Figs. 2 and 3 represent, respectively, a plane view, seen from above, and a longitudinal vertical section of an old French reel, differing somewhat from the Piedmontese, and the principles of which are employed in all the improved reeling establishments of to-day. The following is the explanation of the lettering: *a*. The oblong water-basin heated by a charcoal furnace or by steam, and frequently divided by partitions. *b b*. Hooked wires or eyelets to guide several threads and keep them apart. *c c*. Points where the threads are twisted upon each other to clean their surfaces and compactly round them. *d*. Cylinder on shaft, with a spiral groove in its surface, in which fits a pin from the traversing bar, thus giving the lateral move-

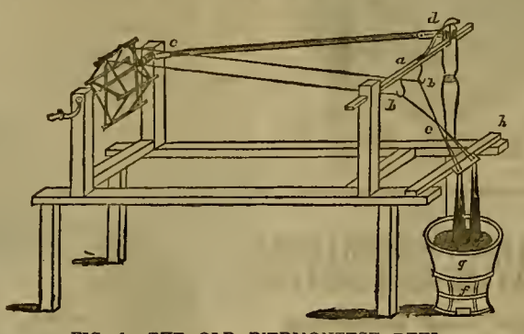

FIG. 1. THE OLD PIEDMONTESE REEL.

ment to the thread which goes through a guider on the front end of the bar, which moves through the arc of a circle. *e*. The reel. *f*. Pulleys which transmit by a belt the rotary motion of the cylinder *d* to the reel *e*, that connected with the reel being the smaller of the two. *g*. Friction lever, for tightening or slackening the endless cord, in setting or stopping the winding operation. There is usually a series of such reels in one apartment, driven by the same motive power, but each of them, as has been shown, can be stopped at pleasure. In case the reels are driven by a steam engine, stopcocks and pipes are so arranged that the water in every basin can be instantly or gradually heated by steam. If desired to run the cocoons, and the other stool is occupied by the child who turns the crank.

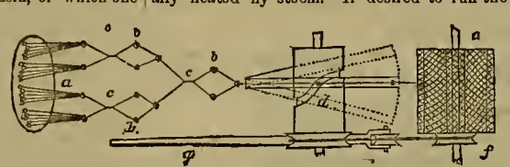

FIG. 2. OLD FRENCH REEL SEEN FROM ABOVE.

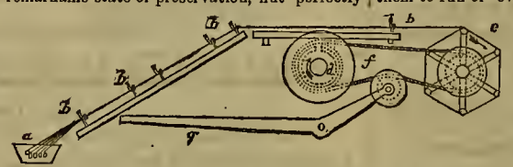

FIG. 3. LONGITUDINAL SECTION OF THE SAME.

reel by hand, a handle can be placed upon the shaft of the cylinder *d*, or of the reel *e*.

Fig. 4 represents a hand reel, of much the same style as the last, set up and ready for work. It is as good a hand reel as is now in use, though it is made on the same principle as the old French reel of forty years ago. The following is the description of its parts: *a*. Tin basin with copper bottom for holding the water in which the cocoons are boiled, fitting tightly over the tray *b*. *b*. Square tin tray for reception of cocoons, etc. *c*. Short stick inserted in a holder, on which the ends of the cocoons are wound, so as to be ready for use. *e*. Cock to let off water from the basin. This should be done every night after use. *f*. Door of furnace lined with fire-bricks, wherein the charcoal fire is lighted to heat the water in *a*. *g*. Flue pipe to carry off fumes. *h h*. Glass eyes on wire holders, through which the threads from the cocoons pass upward to the pulleys at *k*. *i*. A former arrangement for twisting the threads one upon the other; this is now discontinued as unnecessary, since the twist given to the threads at *k* and continued downward to the point *h* effects its purpose with a minimum of friction, and produces a superior thread. This twist is effected by the very simple method of passing one thread round the other, as shown in the small drawing of the pulley *k*. *k k*. Rollers or pulleys revolving on bent-wire stands, over which the threads pass. *l l*. Porcelain tubes on wire holders, between which the threads pass to reach *o*. Glass eyes may be substituted for the first pair of these tubes with equal advantage. *n n*. A grooved arrangement by means of which the long guider working to and fro distributes the thread to the reel "in the cross." Unless the thread is thus wound "on the cross," it cannot be unwound at the mills when required to be thrown, and is, therefore, unsalable. *o*. The top of the reel on which the silk is wound. One of the arms is furnished with the screw-hinge attached, by means of which the length of the arm is diminished to take off the silk.

The adult reeler sits on the stool in front of

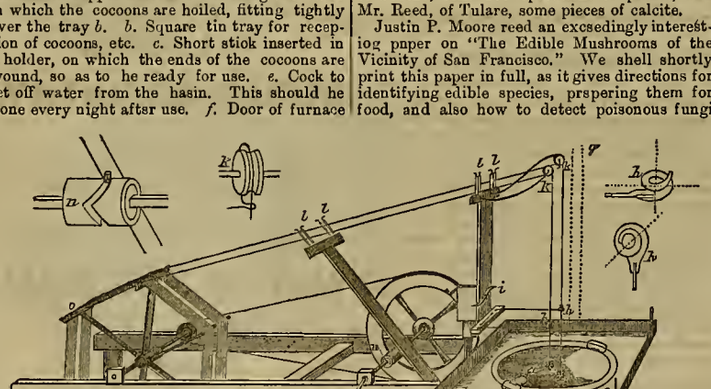

FIG. 4. IMPROVED LOMBARDY REEL READY FOR WORK.

Academy of Sciences.

A regular meeting of the Academy of Sciences was held on Monday evening, President Davidson in the chair. The donations were smaller than usual, but one was exceedingly rare, being a kangaroo squirrel taken from Salt Marsh, Sand Spring station, Churchill county, Nevada. The animal, which had apparently fallen into the marsh and been drowned, is in a remarkable state of preservation, but perfectly coated with saline matter. It was presented by C. B. Plummer. A specimen of amphiroa, found in front of the Ocean Side house, was contributed by Mr. Bissell. Amongst the numerous pamphlets was a complete catalogue of Pacific coast fungi, published under the direction of the Academy, by H. W. Harkness, M. D., and Justin P. Moore. Dr. G. E. Eisen, of Fresno, sent 100 specimens of plants, and Mr. Reed, of Tulare, some pieces of calcite.

Justin P. Moore read an exceedingly interesting paper on "The Edible Mushrooms of the Vicinity of San Francisco." We shall shortly print this paper in full, as it gives directions for identifying edible species, preparing them for food, and also how to detect poisonous fungi and how to overcome the effects of the poison.

W. N. Lockington read a scholarly essay entitled, "Is Evolution Immoral?"

Dr. A. Kellogg described three new species of plants collected by Dr. Gustav Eisen.

The Council of the Academy has appointed the following Curators: Birds and Mammals, Henry Chapman; Fishes, Crustacea, Rediates and Reptiles, W. N. Lockington; Botany, A. Kellogg; Paleontology and Geology, C. C. Cadman; Mineralogy, C. D. Gibbes; Ethnology and Osteology, A. B. Stout.

The treaty with the Hawaiian government has been presented to the German Federal Council.

Legislative Matters.

The members of the State Legislature, now in session at Sacramento, are doing work enough in one direction at least, viz., introducing bills. Measures are proposed which will affect one way or another the various branches of nearly every industry in the State. The most important act so far, which has become a law, is that prohibiting the employment of Chinese by corporations. Already many large corporations have discharged their Chinese help, and others are preparing to do so. There is considerable difference of opinion as to the advisability of the step, many manufacturers arguing that they cannot compete with Eastern people unless Chinese are employed, and the question of the constitutionality of the law will no doubt be tested before long.

Senator George has introduced a bill amending the Civil Code, providing for the redemption of stock sold for delinquent assessments. The bill allows 60 days for the redemption of stock sold for assessments. Under the present laws, property sold under execution for debt or taxes is subject to redemption within a certain time, but the sales of stocks for assessments are peremptory, and there is no chance for redemption.

The following is the bill relating to debris, introduced Saturday by Senator Davis:

Every person, as well as every person who, in behalf of any other person, or as the manager, agent, employe of any person or corporation, who runs or deposits, or who procures or suffers to be run or deposited into the bed or channel of any river in this State, or any branch thereof, any of the tailings or debris from any mine in this State worked by what is called the hydraulic process, is hereby declared guilty of a misdemeanor; provided nothing in this act shall be construed to prohibit the owners of such mine from acquiring various gulches and flats adjacent to such rivers or their branches, and therein depositing such tailings and debris; provided, further, that by means of dams or other obstructions they confine such tailings and debris thereto, and do not allow or suffer them to run or eventually flow into any of the aforesaid river channels or their branches.

In addition to the remedy given by the preceding section, violation of this act may be prevented by injunction at the instance of the State or any county therein, or at the instance of any taxpayers of this State.

The following bill has been introduced by Rowell, of Fresno, to protect water rights:

Section 1. Whenever by priority of appropriation, under and in compliance with the laws of this State, rights to the use of water for mining, agricultural or manufacturing purposes have vested and accrued, the owners of such vested rights shall be maintained and protected in the same.

Sec. 2. The unappropriated waters of all now navigable streams shall be subject to diversion and appropriation for use for mining, agricultural and manufacturing purposes, and such appropriation of water is hereby declared to be a public use thereof.

There was another bill by Rowell on the same subject, repealing section 1,422 of the Civil Code, which protects the rights of riparian owners.

The following is contained in the memorial submitted to the Legislature by the Regents of the University as the wants of that institution:

First—Five thousand dollars for the Agricultural Department, including the Botanical Garden, Agricultural Implements, Agricultural Experiments and Lectures on Practical Agriculture.

Second—Five thousand dollars for the Mechanical Arts Department, including Implements, Mechanical and Illustrative Manipulations, and special instructions therein.

Third—Five thousand dollars for the College of Mining, to complete the equipment of the Metallurgical and Assaying Laboratory, so as to meet the immediate necessities of the said department.

Fourth—Ten thousand dollars for the Department of Mineralogy, for cases, laboratory outfit and equipment, and instruments of precision required for instruction.

Fifth—Six thousand dollars for the compilation of a catalogue of the minerals, rocks, ores, etc., of the State, based on the collection now extant in the University Museum and elsewhere, and obtaining additional data for said purpose (not including the printing of the catalogue), to be done under the supervision of the University.

The workingmen have had several processions during the week, and have called upon many leading corporations and firms, asking them to discharge their Chinamen in accordance with the provisions of the New Constitution.

J. C. Woods, one of California's pioneers, at one time the manager of the banking department of Adams & Co.'s express, died at Mare Island on the 16th inst. very suddenly. He leaves a wife and three children.

SAN RAFAEL MINES.—Mineral prospecting is not a new thing in this county, though, of conrse, it has now expanded into proportions never dreamed of before. In 1858, a party of gentlemen, among whom were U. M. Gordon, J. and J. O. B. Short, T. Parker, O. and B. Smith, W. Pearson, Jas. Harris, Jas. Flood and W. S. O'Brien, opened a ledge on the ridge back of Mr. Lichtenberg's present residence and did considerable work. The rock prospected from $8 to $30 per ton, and it paid, when worked in an arastra, as high as $8; but wages being $4 and $5 per day it was not remunerative and was abandoned. The old arastra stands there to this day. Perhaps under the inspiration of the new deal it will awake from its sleep of two decades and the mine become profitable. James Watson has always held that there was pay rock in many parts of the county, and has prospected more or less every year. We have a nugget of gold that he took from one of his prospects about two years ago. Capt. McKenzie tells of an old miner who packed some rock down from Tamalpais many years ago which assayed handsomely, but the old fellow struck some other lead and never came back. We have heard also, that Mr. J. B. Redmond had an assay made of rock taken from his ranch at Novato, some 20 years ago, which was as rich as the new developments are claimed to be. W. L. Barnard has always had faith that we had mineral wealth, and has chipped a spur from time to time, and so have many others. The gentlemen who are opening the mines on White hill have, therefore, many disciples who start even with them in ready-made faith.—*San Rafael Journal.*

The Explorers', Miners' and Metallurgists' Companion.
Comprising a Practical Exposition of the Various Departmeuts of Exploration, Miniug, Engineering, Assaying, and Metallurgy,
Containing 672 Pages and 83 Engravinge
BY J. S. PHILLIPS, M. E.,
Of California, a Practical Operator for Thirty-eight Years; Explorer, and Resident in the Pacific States and Territories for the past Twelve Years.
PRICE—bound in cloth, $10.50; in leather, $12.
For sale at this office.
— ALSO —
The Explorers' and Assayers' Companion,
(Third edition.) Price of Vol. I, $6.
Forwarded (post-paid) from the MINING AND SCIENTIFIC PRESS Office, by DEWEY & CO.

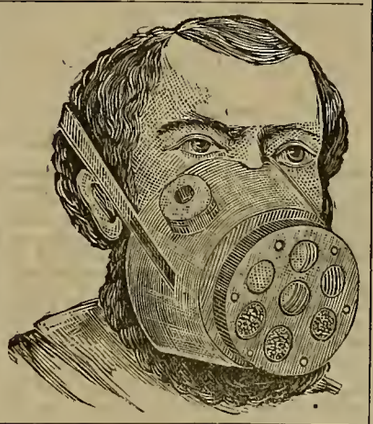
AN ENGINEER,
Favorably known in the East, desirous of settling in California, seeks position as Superintendent or Chief Draughtsman. Competent to design Stationary, Marine, Locomotive, Mill Work, Sugar and Hydraulic Machinery. Speaks Spanish. Unexceptional references. Address EXPERT, this office.

SECURE PATENTS

Through Dewey & Co.'s **Scientific Press** Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free. DEWEY & CO., PATENT AGENTS.
A. T. DEWEY. W. B. EWER. GEO. H. STRONG.

PATENT
LIFE-SAVING RESPIRATOR
Prevents Lead Poisoning and Salivation.



INVALUABLE to those engaged in Dry Crushing Quartz Mille, Quicksilver Mines, Guano Works, White Lead Corroding, Feeding Threshing Machines and all occupations where the surrounding atmosphere is filled with dust, obnoxious smells or poisonous vapors. The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, $3 each, or $30 per dozen. Sent post-paid to any address upon receipt of price.

Copp's Hand-Book of Mining Laws.
Henry N. Copp's band-book of mining laws, just issued, contains the United States mining laws and instructions thereunder, a digest of decisions, forms, list of mining patents issued, etc. The digest of decisions alone is a very valuable thing, giving, as it does, in brief form, all the decisions of the Secretary of the Interior and Commissioner of the General Land Office in relation to mining matters. These are all under proper headings for easy reference. Forms are given for notice of location, proof of labor, notice of forfeiture, miners' lien, application for survey, patent, etc., affidavit of improvements, etc. There is also a list of patents issued for mining claim from July 26th, 1866, to August 1st, 1877. The book is of pocket size and very convenient for all who are interested in mines. It will be sent post-paid for $1, on application to Dewey & Co., 202 Sansome street, San Francisco

Diamond Drill Co.
The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.
A. J. SEVERANCE & CO.
Office, No. 320 Sansome street, Room 10.

Kendall's Spavin Cure
Is a sure cure for spavin, splint, curb, callous, sprains, swellings, galls, lameness and all enlargements of the joints or limbs. It will completely remove a bone spavin without blistering or causing a sore. It is also as good for man as for beast, and is used full strength at all times of the year with perfect safety. A cure which we are knowing to is a person who suffered 15 years with hip-joint lameness and was permanently cured two years ago with Kendall's Spavin Cure. Remember we claim it will cure a bone spavin and completely remove the bunch without blistering.
Office U. S. Marshal, Western Dist. of Michigan, } Kalamazoo, April 15th, 1879. }
B. J. Kendall, Enosburgh Falls, Vt.—DEAR SIR:—I received the two bottles of your spavin cure forwarded by express in January last. I am happy to state that it performed all your advertisement called for. In three weeks after I commenced using it the spavin was entirely removed and a valuable horse restored to usefulness. Very truly yours, JOHN PARKER.
Send for illustrated circular giving positive proof. Price, $1 All Druggists have it or can get it for you.
DR. B. J. KENDALL & Co., Prop's, Enosburgh Falls, Vt.

W. BRUCKNER'S
ROASTING FURNACE
AND
Ore Pulverizers.

(Awarded the Premium Gold Medal at Naples, Italy.)

The furnace is especially adapted for roasting refractory ores; there are more than fifty in use in Colorado, giving perfect satisfaction.
The Ore Pulverizer is built in different sizes. It is preferable to Stamp Mills because it requires less power and less repairs than Stamps. No extra expense for setting up, and no foundation. Less weight and less cost than stamps.
Furnished also in sections for packing.
For circulars and prices apply to

Ingersoll Rock Drills.

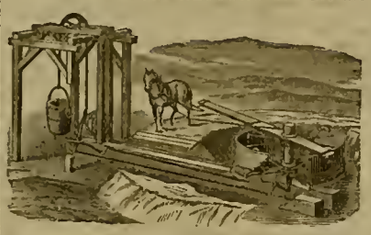
In use in the largest and best Mines of the Coast.

HAS AUTOMATIC FEED.

Has less Repairs.

Is Lighter and more Easily Adjusted than any other Drill.

Our DRY AIR COMPRESSORS are the most Economical Compressors in the Market.



MINERS' HORSE-POWER.

This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.
The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing

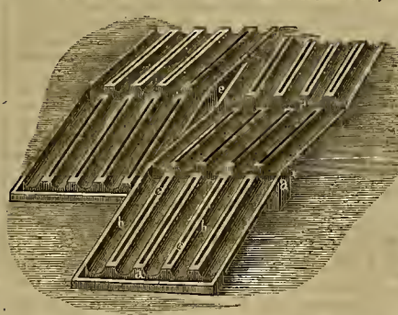
Manufacturers and Importers of

Chemicals and Chemical Apparatus,

Suitable for Analytical, Technical and Experimental Use. ☞Descriptive Priced Catalogues furnished on application.

Howland's Under-current, Mill and Sluice Riffle.



This invention meets a want which has long been felt by Gravel Miners and Millmen, viz.: that of a simple, cheap Riffle which will save the largest possible amount of gold or sulphurets, with the least possible waste of quicksilver. That this Riffle answers all these conditions will be apparent to any practical man who takes the trouble to examine it. The arrangement of this Riffle is such that there is a strong, unobstructed upper-current to carry off and break up the gravel or cement, and a slow under-current, checked by numerous riffles, which give gold or sulphurets a better opportunity of settling than if they were exposed to the force of the main current.

In this Riffle there are cast troughs for the quicksilver, which extend entirely across the sluice, and while they are so placed that the current will naturally pitch towards them, and give every opportunity for amalgamation, the quicksilver is fully protected from flouring or leakage. There is no mechanical skill required in taking out or replacing the sections.

Full particulars in regard to this invention can be obtained by applying to

STEIGER & KERR, of the Occidental Foundry, 137 First St., S. F.,

Who have the sole right of manufacturing this Riffle, and who will receive and attend to all orders.

Sanderson Bros. & Co.'s
BEST REFINED CAST-STEEL.

WARRANTED MOST SUPERIOR FOR DRILLS, HAMMERS, ETC.

A full and complete stock of this reliable and well-known brand of Steel, for mining and other uses, now in stock, and for sale at

21 and 23 Fremont Street, S. F., - H. D. Morris, Agent.

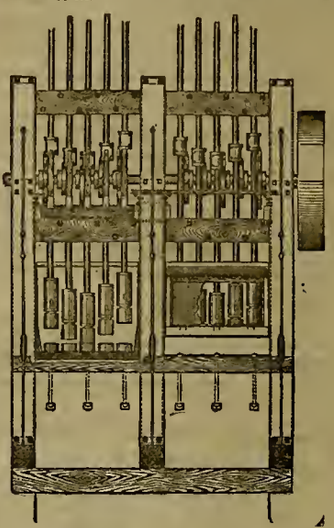
Machinery.

GOLD AND SILVER
Grinding and Amalgamating MACHINERY.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies.



SPERRY'S
Wrought-Iron Frame
FOR STAMP MILLS.

Great saving in time and money over the wood frame. Is made complete with wrought-iron frame ready to put upon the foundation, requiring no skilled millwright. These mills are unsurpassed in excellence in every particular.
We are furnishing all the Machinery for a 10-Stamp Gold Mill, including Crucible, Steel Shoes and Dies, Boiler and Engine, Counter Shafting, Pulleys, etc., Stamps weighing 450 lbs. each, with Copper Plate inside of the Mortars, and for tables outside, making all the Machinery complete for a 10-Stamp Mill for the sum of

$2,550.

We construct Mills with Stamps weighing from 250 to 900 lbs. for gold or Silver Ores. Wet or dry Crushing Mortars. Will contract to erect complete Gold and Silver Mills on the most improved plans. We have 30 years' experience in mining and milling Gold and Silver Ores, and can compete with the world. Send for a circular. Address

A Card from Architects.

The California Architect and Building Review.

Office, No. 240 Montgomery Street, San Francisco, Cal.

It is with pleasure that we publish the following from prominent Architects in this city:
Believing that a journal of its kind is a necessity on this coast, and judging from what has appeared in the "Quarterly Architectural Review," we are led to believe that the CALIFORNIA ARCHITECT AND BUILDING REVIEW will be worthy of generous support and encouragement. We therefore pledge our cordial sympathies, personally, and hope that the enterprise will receive kindly recognition and liberal support from all Architects and Builders and the public generally. (Signed) David Farquharson, Wright & Sanders, S. H. Williams, Thos. J. Welsh, P. Huerne, John Marquis, B. McDougal & Son, Wm. Mooser, Wm. Curlett, Meeker & Banks, W. C. Hoagland, S. & J. Newsom, B. Henrickson.

The Large Circulation of the MINING AND SCIENTIFIC PRESS extends throughout the mining districts of California, Nevada, Utah, Colorado, Arizona, Idaho, Montana, British Columbia, and to other parts of North and South America. Established in 1860, it has long been the leading Mining Journal of the continent, its varied and reliable contents giving it a character popular with both its reading and advertising patrons.

[CONTINUED FROM PAGE 117.]

with Belcher. The incline hslow the 2700 level is being continued down.

WARD.—Shaft down 2035 ft and making good progress.

NEW YORK.—The crosscut east on the 1600 level has entered the casing of the ledge and is developing some good indications as the ore vein is being neared.

MEXICAN.—The main lateral drift north, 2300 level, is being pushed on rapidly toward the workings south from the bottom of the joint Union winze from the 2,000 level, and connection will be made by the latter part of this week. The joint Union crosscut east, 2300 level, is in 30 ft, and passing through a favorable vein formation.

CON. VIRGINIA.—The joint California east crosscut on the 2350 level continues in a fine vein formation showing some quartz, its face 67 ft east of the lateral drift north. The joint Best & Belcher crosscut east on the 2150 level is in 85 ft. The yield of the stopes on the 1750 and 1550 levels continues.

YELLOW JACKET.—Since the connection between the north drift on the 2700 level and that south on the 2800 of the Con. Imperial, work has been pushed south on the 2700 level.

GOULD & CURRY.—The raise from the 1700 level to meet the G. & C. and B. & B. shaft is making exceedingly good progress and is now up 87 ft.

BULLION.—Still repairing the main shaft and incline. While this work is going on and preparatory to opening up the 2500 level, a diamond drill is running west into the ledge in the direction whence hot water was encountered above, to guard against an influx of it when the level is opened up.

QUINN.—So much water has been encountered on the 100 level that it could not be profitably bailed out. The men have, therefore, been knocked off.

UTAH.—The incline is down 220 ft on the slope below the 1750 level and in good working ground, having but a light flow of water. East crosscut, 1750 level, is in 135 ft in good vein material. South lateral drift is cutting vein matter.

BELMONT DISTRICT.

BELMONT.—Cor. *Courier*, Feb. 7: Our crosscut west from 300 level was advanced through very hard slate, in which we find stringers of quartz showing strong traces of mineral. The main 300 drift running north was extended 12 ft in the vein, which is showing 8 inches of $40-ore. We will commence to extend No. 2 raise up to the next level.

SAN ANTONIO.—Are pushing the 450 crosscut as fast as possible. The rock is a very hard porphyritic slate. The rock appears to be changing for the better. By sounding through from the 350-ft drift we find we are on the correct course for the ledge.

BRISTOL DISTRICT.

HILLSIDE.—Pioche *Record*, Feb. 7: The Hillside smelter will shut down next week. As it is a heavy expense in lining it up and keeping it in repair the company intend tearing it down and putting in position their new water-jacket, which will be placed in running order as soon as possible. They have already ordered from San Francisco another water-jacket furnace of 50 tons capacity, sections of which ought to arrive in 20 days. As the cupel furnaces of the Hillside company have proven to be a perfect success, additional facilities will soon be added, enabling the company to refine all their bullion, thus doing away with the tedious process of shipping by teams to the railroad.

BRISTOL.—The machinery of the Bristol mining company is awaiting transportation at the terminus of the Utah Southern. It is said to be the intention of this company to erect their mill adjoining the Hillside reductiou works.

EUREKA DISTRICT.

EUREKA CON.—*Sentinel* Feb. 12: First level—Winze in all 20 ft. Third level—West drift in all 86 ft. Seventh level—Northeast drift in all 110 ft; north drift in all 91 ft; upraise in all 17 ft; southwest drift in all 155 ft. Eight level—East drift in all 111 ft. Niuth level—Drift from raise in all 15 ft. Tenth level—East drift in all 132 ft; drift south of quartzite in all 19 ft. Eleventh level—East drift in all 102 ft.

STRIKE IN EUREKA TUNNEL.—A new strike of an ore body has been made, the extent of which is not yet known. It commenced in the bottom of the tunnel, about an inch and a half thick, and disappears in the rock, at which point it is 31 inches thick. No assays have yet been made, but the ore is apparently of good quality. The tunnel is now passing through the El Dorado No. 2, patented ground, the property of M. H. Joseph, Fifield and Malloy.

EL DORADO No. 2.—Is situated on the east side of Prospect mountain, about 1,000 ft from the mouth of the Eureka tunuel, which it crosses, and runs north of about 200 ft. It gives evidence of being a good mine, showing heavy croppings, commencing at its south end line and running northwest about 1,100 ft, when they sink under a shale formation. During three months, under a course of prospecting, 32 tons of ore yielded an average of over $100 per ton in gold and silver; very trsctable and of excellent quality for smelting. Not a pound of ore has yet been taken from the stopes. The vein runs from six inches to five ft in thickness, showing continuously from where it was first struck to the lowest depth attained. The surface ground is covered by a United States patent.

MAMMOTH DISTRICT.

MINING ITEMS.—The Silver Wave, lately incorporated by Mr. Stocker and others, shows rich ore assaying from $100 to $150 per ton. Welch & Evans have a good thing in their mine and 250 tons of ore on the dump, which runs from $100 to $250 per ton. Welch, Labeau & Millers are extracting ore worth from $200 to $300 per ton. The Esta Buena (now idle for want of machinery) produced over $27,000 in the last two months' run. Holmans' mine, near Marble Falls, is prospecting well, as is also McPherson's, near the same place, ore from which, lately milled, gave $140 per ton.

TOIGABE DISTRICT.

GRANTSVILLE ITEMS.—A big strike has been made in the Lefler company's mine, situated immediately north of the Great American Rooster. The ledge just discovered is said to be very extensive, and assays all the way from $40 to $800 per ton. The main shaft in this mine is down 40 ft, and a tunnel has been run in a distance of 170 ft. The discovery of this body of ore has created quite an excitement in Grantsville, and the prospects of this camp becoming one of the best in Nevada are improving daily. Peter Lefler is one of the original locators of this mine.

WHITE PINE DISTRICT.

CHERRY CREEK ITEMS.—Eureka *Sentinal:* The Star mine is looking better and showing more pay ore than it has for the past six months. The 540 or lower level has, within the past two weeks, opened out nicely, showing from four to five ft of first-class ore, and its prospects for a long and profitable run are remarkably flattering. The Star mine has produced over $1,000,000. This for a young mine, with only a depth of 540 ft, and being situated in much-abused White Pine county, is a very fair showing. W. J. Haynes, Superintendent of the El Capitan mine, at Shellburn, has recently developed a flue body of ore in that mine, proving it to be a valuable property. Mr. E. S. Smith, of New York city, who has a bond on the Ruby Hill mines, belonging to F. A. McDermitt and others, has put a force of men to work. This property is well known by all old White Piners, and is believed to be as meritorious a mining property as there is in eastoru Nevada. Mr. J. B. Williamson has bonded the Teacup and Geneva mines to Eastern parties. The Teacup has produced $700,000, and has a shaft of 700 ft, showing a true contact vein of high-grade milling ore. The Geneva also has produced considerable bullion, which shows quite a large percentage of gold. Dr. Brooks, of Ward, has bonded some mines in Silver canyon and put a force of men to work. The Muncey Creek mines, belonging to Hallowell, Plageman and others, are bonded to Eastern parties. The Martin White company, at Ward, are getting along nicely with their tunnel, making as much as 20 ft every 30 hours.

WINNEMUCCA DISTRICT.

BARTLETT CREEK ITEMS.—*Silver State*, Feb. 9: G. J. Barry arrived here yesterday from Bartlett creek, where he has been engaged in mining for over a year past. He has prospected the Mogul mine to a depth of 200 ft. The ledge is from three to four ft wide, and he says the ore will average $100 in silver and $50 in gold to the ton. A. Hall is at work on the Gaddy running a tunnel, and there is eight inches of ore in the ledge that will work $500 in gold to the ton. Beach & Co. are at work on the Sage Hen ledge, on Snow creek, and have four ft of ore that will work $15 per ton in gold. J. W. Trevathan is developing the War Eagle. The ledge shows four ft of ore, and about 100 tons of ore is on the dump at this mine that will work $25 to the ton in gold.

ARIZONA.

GLOBE ITEMS.—*Silver Belt*, Feb. 7: J. W. Haskin has purchased from R. W. Chilson the South Silver Nuggrt, Richmond basin. It is reported as looking well. Mike Whalen has the contract for running 100 ft on the Haskin tunnel, tho consideration being $700. The shaft and tunnel of the Irene are so near a juncture that the blows of the hammers can be distinctly heard from either. The break may be expected any moment. Mr. Watson is having another tunnel run on the Silver Era ledge, which is now in about 120 ft—ore wholo distance, which fills the face of the tunnel. The width of pay ore cannot he ascertained until the ledge is crosscut. It is currently reported that the crosscut on the Mexican ledge has revealed, at the depth of 103 ft, a vein 36 ft wide. Another statement is that the vein is 68 ft and shows 40 ft milling ore. There is no doubt but what a large body of ore has been discovered, and that further depths will reveal a still larger body. The strike is a flattering one for the camp, and will put money in the pockets of the owners of the mine.

News in Brief.

SENATOR LAMAR is in Washington.

A DAMAGING flood prevails in Kentucky.

THE Grant party have left Havana for Vera Cruz.

A SHERMAN CLUB has been organized in New York.

A NATIONAL Blaine Cluh has been orgauized in Washington.

G. W. CARLTON, tbe slayer of Brummett at Hollister, hae heen held to anewer without hail.

THE Duchees of Marlhorough writee that the danger from famine in Ireland now appeare over.

A MOVEMENT ie on foot in Oregon to induce colored people to emigrate from tbe South to that State.

A RAILWAY train was attacked in Spain Sunday last hy brigande, hut they were driven off hy the guard.

THE losses to farmere of the United Kingdom during 1879 are estimated at from £100,000,000 to £150,000,000.

THE authority of General Marquez ie completely estahlished throughout the peninsula of Lower California.

A DESPERATE, though nneucceesful attempt was recently made hy tbe prisoners in the jail at Cheyenne to eecape.

THE Superintendent of Census knows of no legal reasons why women ehould not be appointed as enumerators.

ONE of the columne in pursuit of Indiane in Arizoua was compelled to retreat on the 8th inet., losing their rations, etc.

AT Newark, N. J., recently, Margaret Meinhoffer and Frauk Lammone were found guilty of the murder of the former'e husband.

The Hofmann Process.

EDITORS PRESS:—In my former letter I wrote tbat Mr. Aaron did not know what he was writing ahout when he stated that he wae in possession of a pile of my tailings assaying $28 per ton. The amount left in the tailinga is of course of no importance, the question heing only how Mr. Aaron came to the expreseed conclueion that those tailinge resulted from my treatment. In his article of Feh. 14th he adds another ahsurd statement, that he "eems" to be the only person hesides myself who treated gold sulphurete at Melrose; he also tries to make eome kind of a compromise hy saying that it sometimes happene to him that too much is left in his tailinge. I can tell him once more that a great many tone of gold sulphurets have heen treated there hy other persons than myself, himself and Stewart, hut if his conclusion is based on his "as I seem," there ends all discuseion. His "seem" does not entitle him to write, "but let it pass, I have no desire to press." I wieh Mr. Aaron to underetand that I do press for a proof, if he doee not like to appear as one who willingly mierepreeente. Blowing does not whitewash; facts prove. G. K.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

[From Official Reports for the "Mining and Scientific Press," Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

FOR THE WEEK ENDING FEBRUARY 10TH, 1880.

224,326.—MEAL BIN—C. B. Brown, Placerville, Cal.
224,277.—BOX FOR AMALGAMATOR SPINDLES—E. Coleman, San Francisco.
224,401.—TEN-FOOT RULE—W. J. Derrickson, Clayton, California.
224,284.—WIRE CABLE RAILWAY—W. Eppelsheimer, S.F.
224,414.—GALVANIC BELT—E. J. Fraser, S. F.
224,470.—GRAIN SEPARATOR—W. H. Parrish, Salem, Ogn.
224,357.—GRINDING APPARATUS—J. Rutherford, S. F.
224,483.—HOISTING DEVICE—S. B. Segur, Gold Hill, Nev.
224,364.—STEERING VESSELS—S. F. Tappen, S. F.
224,354.—FAUCET—C. C. Redmond and A. W. White, San Jose, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among tbe patents recently ohtained throngh Dewey & Co.'e SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention :

AIR COMPRESSOR.—Wm. R. Eckart, Virginia City, Nev. Patented Feb. 3, 1880. No. 224,081. The improvements in this invention conеist in a peculiar means of introducing spraye of water to the interior of the cylinder of an air compressing engine, hy which air is cooled. As the pieton approaches one end of the cylinder and gradually compresees the air contained in that part of the cylinder, the epray of water is diecharged from the nozzle in the pieton, eo as to fall though the body of air ae it gradually increases in deneity, and thie water aheorhs the latent heat given out hy the air as it is compressed, eo that the latter may be delivered from the cylinder at a reduced temperature. The action of the continuoue epray, which is advanced as it discharges iuto the hody of air increasing in deneity, ie more effective in cooling it than when diecharged from a etationary jet through tbe eidee of the cylinder. While this action ie taking place in tbe condeneing or compressing end of the cylinder, the jet at the oppoeite side of the piston ie discharging a constant epray into the charge of air which is heing received through the valvee into that end of the cylinder.

CABINET KITCHEN TABLE.—W. H. Wieeter, S. F. Patented Jan. 27, 1880. No 223,828. Thie device is intended to be used in connection with oil-cooking etovee. The hody of the tahle coneiste of a box of sufficient deptb to just inclose the etove or etoves which are to he employed in cooking. The top of the tahle being caloulated to be of the proper hight, the hottom of the receptacle will he of euch an elevation, that the etove will etand eo as to be convenient for use. The hody is eeparated hy a partition into two compartments, one of which eervee to contain the utensils which are to he used about the etove, while the other containe the etove iteelf. In front of tbe stove compartment ie a vertically-eliding diaphragm which forms one end of the tahle when closed, but which may he removed when the table top has heen drawn hack so as to leave the etove compartment entirely open and unimpeded for work. Beneath the tahle is a drawer with compartments, in which may he kept knives, forks, etc. A single leg is attached directly to one end of the top, so that when the top ie cloeed this leg etands cloee to the end of the table body, and ie entirely out of the way.

CRUSHING, GRINDING AND AMALGAMATING MACHINE. — Laneing Haight, Sonora, Cal. Patented Feh. 3, 1880. No. 224,087. In the ordinary form of Chilean mill, in which each of the grinding wheele hae a rotation on its horizontal axie, and also a rotation around the common vertical axis, the wheels are driven hy a pinion and bevel cog-wheel connected with the vertical shaft. In thus driving the wheels from the central vertical ehaft great power ie required, and mills of this claee require eo much power in conecquence, that they have not heen found ae economical as would otherwise have heen the caee. This invention relates to certain improvemente in the ahove class of ore crushers or grinders, and consiets in applying the power directly to the periphery of the rotating crushing wheels hy means of a crown-wheel acting eolely hy friction. It also consists in the combination, with the revolving cruehing wheels, of a peculiarly operating ore feeder, which diethibutee the ore equally under the wheels.

PROCESS FOR THE EXTRACTION OF PRECIOUS METALS FROM ORES.—Ottaker Hofmann, Monitor, Cal. Patented Jan. 27, 1880. No. 223,913. This processa ie intended particularly for heneficiating that class of ores containing both gold and eilver in additioa to hase metal. It consists in a peculiar treatment of the ore; first, hy leaching for the removal of the eilver, and then hy chlorination for the removal of gold. The ore is first submitted to a chloridizing roasting, and the base metale are leached out, the latter operation heing performed in a novel manner, to prevent loss of chloride of eilver witb the base metals, and after the hase metale are removed the eilver is ohtained by leaching in the usual way. After thie operation ie over the mass is thoroughly waehed to remove all chemical ealt, and then impregnated and left in contact with chlorine gas, after which the gold ie extracted hy water and precipitated with eulphate of iron.

DUMPING CAR.—John Jones, Lakeville, Cal. This invention relates to an improved dumping car, and consists in the construction of two separate hoxes or receptacles, one of which discharges at the center and the other at the side, theee hoxes being eo arranged as to he either dumped hy hand or hy the power of the locomotive, as desired, or hoth at the eame time or eeparately. It further coneists in providing a centrally-placed ecraper hetween the rear wheele, which will spread the ballast dumped from the centrally-discharging car, sloping it from the center outwardly, as required. The whole operation of dumping and ecraping may be performed while the train is moving along, hoth the inside and the outeide of the track heing ballasted. When filling in embankmente, etc., where the track ie on treetlee, the ecraper may he dispensed with, but the loads will he dumped within close proximity to the line of the track.

PLAITING MACHINE.—J. E. Chenette, Hillsborough, Oregon. Patented Jan. 27, 1880. No. 223,800. Thie device relates to an improved machine for plaiting goode of all kinds, and it coneiete of a frame baving rollers at each end, over which a carrying helt moves, and a table hetween tbeee rollere eupporte the center of the helt upon its surface. Above this table ie a hinged frame carrying a pressure roller and a knife and knife bar, which are operated by a eyetem of levers eo as to take the goods and paee them heneath the roller in plaits or folde, the belt being at the eame time moved forward eo as to carry the plaite heneath an iron apron, which may have a bot or cold iron placed upon it to fix the plaits and render them permanent.

SPARK-CONTROLLING STACK FOR BOILERS.—John W. Pearce, Suisun, Solano county, Cal. Patented Jan. 13, 1880. No. 223,605. This device relatee to certain improvements in apparatus for controlling or extinguiehing tbe sparks which are ejected from the stack or escape-pipe of engine furnacee and hoilers; and it consiets in a novel combination of a curved pipe leading from the emoke-hox into a receptacle containing water, and in the combination with this pipe, of a fan hlower, which diechargee ite hlaet into the stack to aesiet the draft. The stack ie conetructed with a ewivel joint, which allowe it to be turned to oue side or upward, so ae to provide a clear draft when the hoiler is cold and on first etarting a fire. The water receptacle may have a direction-flue extending upward to aseist in diecharging the emoke.

HORSE POWER.—Robert M. Beehee, Chico, Cal. Patented, Jan. 27, 1880. No. 223,875. This device coneiste in mounting the maeterwheel in a peculiar manner, eo that the mechanism for producing a reciprocating or rotary motion may all he contained within ite circumference. It also relates to certain detaile of construction hy which either a rotary or reciprocating motion may he imparted from the power at the eame time. The whole power, with ite connected driving apparatus, is in a very compact form, and hoth light and strong.

MEASURING FAUCET.—Wm. M. Sack, Oakland, Cal. Patent No. 224,108. Dated Feh. 3, 1880. Thie device relatee to certain improvements in faucets for automatically measuring liquide; and it coneists in certain detaile of conetruction, especially a conneoting air-pipe hetween the two measures, hy which the air expelled hy the liquid entering one is tranamitted to fill the epace in the one heing emptied.

EVERY new eubecriber who does not receive the paper, and every old eubscriber not credited on the lahel, within two weeke after paying for this paper, ehould write personally to the publishers without delay, to eecure proper credit. This is necessary to protect oureelvee and subscribers against the acte and mistakes of others.

FRESH attractions are constantly added to Woodward's Gardens, among which is Prof. Gruber's great educator, the Zoographicon. Each department increases daily, and the Pavilion performances are more popular than ever. All new novelties find a place at this wonderful resort. Prices remain as usual.

HOW TO STOP THIS PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by *letter*.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription, and request that they circulate the copy sent.

EXTRA COPIES can usually he had of each issue of this paper, if ordered early. Price, 10 cents, postpaid.

Mining and Other Companies.

Atlanta Mining Company.—Location of

principal place of business, San Francisco, California. Location of works, West Tintic Mining District, Juab County, Utah.

Notice is hereby given that at a meeting of the Board of Directors, held on the Second day of January, 1880, an assessment (No. 1) of Five Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, room 7, No. 420 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Fifth (5th) day of February, 1880, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Friday, the Twenty-Fourth (24th) day of February, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—Room 7, No 420 Montgomery street, San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Thursday, February 26th, 1880, and the day of sale to Monday, the 29th day of March, 1880. By order of the Board of Directors.

A. F McGREW, Secretary.

Office—Room 7, No. 420 Montgomery street, San Francisco, California.

California and Oregon Land Company.—

Principal place of business, San Francisco, California. Location of works, Lake and other counties, Oregon.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 5th day of February, 1880, an assessment of Thirty cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin, to the Secretary.

Any stock upon which this assessment shall remain unpaid on the 15th day of March, 1880, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Thursday, the 15th day of April, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

R. N. VAN BRUNT, Secretary.

Office, 318 Pine street, room 6, San Francisco, California.

Cataract and Wide West Gravel Mining

Company. Principal place of business, San Francisco, California. Location of works, Eho Mining District, Calaveras County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 2od day of February, 1880, an assessmeot (No. 2) of Twenty-five cents (25 cts.) per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin, to the Secretary at 26½ Kearny street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 8th day of March, 1880, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 29th day of March, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

WM. B. LAKE, Secretary.

Office, room 18, 26½ Kearny Street, San Francisco Cal.

Gover Mining and Milling Company.—

Location of principal place of business, San Francisco, California. Location of works, Amador County, near Drytown, California.

SECURE PATENTS

Through Dewey & Co.'s **Scientific Press** Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free. DEWEY & CO., PATENT AGENTS.

William Hawkins,

(SUCCESSOR TO HAWKINS & CANTRELL).

MACHINE WORKS,

210 and 212 Beale Street, bet. Howard and Folsom Sts., - - San Francisco.

Manufacturer of

IMPROVED PORTABLE HOISTING ENGINES,

FOR MINING AND OTHER PURPOSES.

Also of the HAWKINS' PATENT ELEVATOR HOIST, for Hotels, Warehouses and Public Buildings.

Steam Engines and all Kinds of Mill and Mining Machinery.

Fulton Iron Works.

Hinckley, Spiers & Hayes.

(ESTABLISHED IN 1855.)

Works, Fremont and Howard Sts. | San Francisco, Cal. | Office, No. 213 Fremont St.

MANUFACTURERS OF

Marine Engines and Boilers,

Propeller Engines either High Pressure or Compound Stern or Side Wheel Engines.

Mining Machinery.

Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.

Mill Machinery.

Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores Water Jackets, Etc.

Sugar Machinery.

Crushing Rolls, Clarifiers, Vacuum Pans, Air Pumps, Concentrators, Bag Filters, Charcoal Filters, Blow-up Tanks, Coolers and Receiving Tanks.

Miscellaneous Machinery.

Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Oil Well Retorts, Powder Mill Machinery, Water Wheels.

Engines and Boilers of all kinds, either for use on Steamboats and made in accordance with the Act of Congress regulating the same, or for use on land. Water Pipe, Pump or Air Column, Fish Tanks for Salmon Canneries of every description.

Boiler repairs promptly attended to and at very moderate rates.

Pacific Rolling Mill Co.,

SAN FRANCISCO, CAL.

MANUFACTURERS OF

RAILROAD AND MERCHANT IRON,

ROLLED BEAMS, ANGLE, CHANNEL AND T IRON, BRIDGE AND MACHINE BOLTS, LAG SCREWS, NUTS WASHERS, ETC., STEAMBOAT SHAFTS, CRANKS, PISTONS, CONNECTING RODS, ETC., ETC.

Car and Locomotive Axles and Frames, and Hammered Iron of Every Description.

HIGHEST PRICE PAID FOR SCRAP IRON.

Orders Solicited and Promptly Executed. Office, No. 16 FIRST STREET.

PACIFIC IRON WORKS,

First and Fremont Streets, between Mission and Howard, San Francisco, Cal.,

RANKIN, BRAYTON & CO.,

Manufacturers of

ENGINES, BOILERS, MARINE AND STATIONARY. PUMPING, HOISTING, AND MINING MACHINERY INCLUDING BATTERIES, AMALGAMATING PANS AND SETTLERS, CONCENTRATORS, ORE FEEDERS, CRUSHING ROLLS AND ROCK BREAKERT. ALSO, WATER JACKET SMELTING FURNACES, FOR REDUCING LEAD, SILVER AND COPPER ORES, QUICKSILVER FURNACES, RETORTS AND CONDENSERS, ROASTING AND CHLORIDIZING FURNACES, SUGAR MILL MACHINERY, WATER WHEELS, ETC., ALL OF THE LATEST AND MOST IMPROVED CONSTRUCTION.

Agents for the Allen Engine Governor, Bailey Air Compressor, Howell's Improved White Furnaces, Walker's Compound Steam Pumps, Etc.

L. C. MARSHUTZ. T. G. CANTRELL.

National Iron Works,

Northwest Cor. Main and Howard Sts., San Francisco.

Stationary and Compound Engines, Quartz Crushing and Amalgamating Machines, Flour, Sugar and Saw Mill Irons.

CASTINGS AND FORGINGS OF EVERY DESCRIPTION.

Repairing of Every Description Promptly Attended to

THE RISDON IRON AND Locomotive Works

Corner Beale and Howard Sts.,

SAN FRANCISCO, CAL.

W. H. TAYLOR, Pres't. JOSEPH MOORE, Sup't.

Builders of Steam Machinery

IN ALL ITS BRANCHES,

Steamboat, Steamship, Land

Engines and Boilers,

HIGH PRESSURE OR COMPOUND.

STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.

ORDINARY ENGINES compounded when advisable.

STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.

STEAM BOILERS. Particular attention given to the quality of the material and workmanship, and none but first-class work produced.

SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans. Also, all Boiler Iron Work connected therewith.

WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, sheets rolled, punched, and packed for shipment ready to be riveted on the ground.

HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.

SHIP WORK. Ship and Steam Capstans, Steam Winches, Air and Circulating Pumps, made after the most approved plans.

PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

San Francisco Pioneer Screen Works

J. W. QUICK, MANUFACTURER,

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

32 Fremont Street, San Francisco.

Books for Miners and Millmen

KUSTEL'S ROASTING OF GOLD AND SILVER ORES, and the extraction of their respective metals without quicksilver. Illustrated. 142 pages. 1870. A valuable and carefully written work. Postpaid, $2.50. Published and sold by Dewey & Co., S. F.

KUSTEL'S CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for gold-bearing sulphurets, arseniurets, and gold and silver ores generally, with 120 lithographic diagrams. 1867. This work is unequaled by any other published embracing the subjects treated. Post-paid, $7.50. Printed and sold by Dewey & Co., S. F.

PHILLIPS' EXPLORERS, MINERS AND METALLURGISTS COMPANION, comprising a practical exposition of the various departments of exploration, mining, engineering, assaying and metallurgy. 672 pages and 83 illustrations. A most valuable and comprehensive book of reference to prospectors and practical miners. Post-paid, $10 50 Sold by Dewey & Co., S. F.

AARON'S TESTING AND WORKING SILVER ORES.—Illustrated. 114 pages. 1876. A useful and practical work, free from technicalities and extremely serviceable for miners' use. Post-paid, $2. Published and sold by Dewey & Co., S. F.

COPP'S HANDBOOK OF MINING LAWS.—Containing the U. S Mining Laws, Digest of Decisions, Forms, etc., 1877. Pocket size, and very handy and convenient for miners. Post-paid, $1.00. Sold by Dewey & Co., S. F.

PALACE RESTAURANT

218 Sansome St.

This elegant and spacious S. F. Restaurant has been re-opened with superior bill of fare daily, and is now the best and most popular dining saloon on this Coast.

Good Living at Reduced Prices

[Lunch ready at 10 A. M.] Resident business men and visitors from abroad will be wise in giving this place an early call. Examine bill of fare and prices.

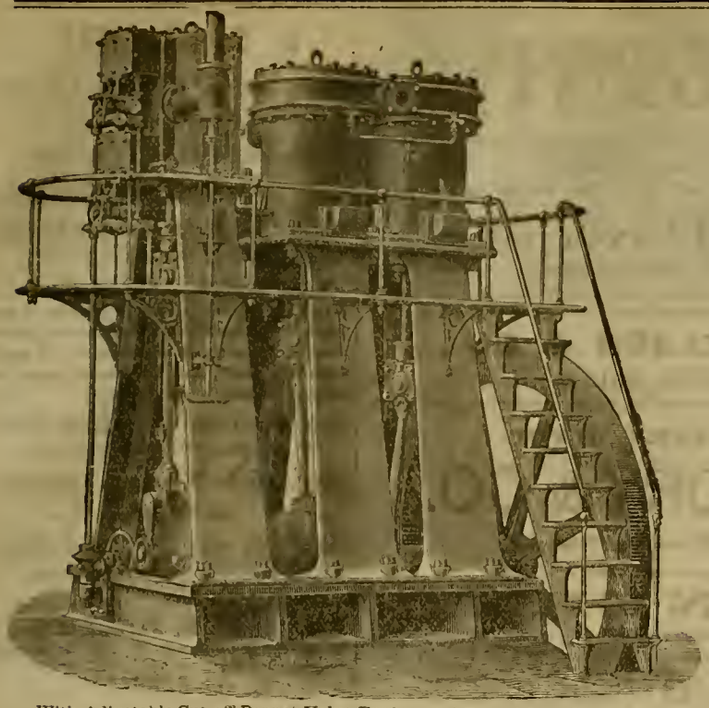
Will find it to their advantage to call on us at 328 BUSH STREET, bet. Montgomery and Kearny, (up-stairs), S. F.



With Adjustable Cut-off Poppet Valve Engine, and Forced Iron Crank Shafts.

Mining Machinery Depot,

PARKE & LACY,

21 and 23 Fremont Street, S. F.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street, - - San Francisco, Cal.

SAVE YOUR GOLD!

Highly Important to Miners and Quartz Mill Men!

SILVER PLATED AMALGAMATING PLATES.

The best process yet discovered for saving fine or float gold. Extensively used with great success in gravel and quartz mining in various parts of the Pacific Coast. Over one thousand orders have been filled, and the demand is constantly increasing. Old Mining Plates bought or taken in exchange for new Silver Plated Plates. Gold extracted from old Plates at a moderate cost. Old Plates (which often contain a surplus of gold above the cost of plating) can be re-plated.

With the most extensive facilities on the Pacific Coast, orders can be filled very promptly and satisfaction guaranteed. All kinds of metal goods plated. Send for circular.

SAN FRANCISCO GOLD, SILVER, NICKEL AND COPPER PLATING WORKS,

(Formerly McHaffie Direct Steel Castings Co.)
Works, CHESTER, Pa. 407 Library St., PHILADELPHIA

SHEET IRON PIPE.

FRANCIS SMITH & CO.,

Manufacturers of

THE PATENT CHANNEL IRON WHEELBARROWS.

THE STRONGEST BARROW MADE. These Barrows are made by Superior Workmen, and of the best material. All sizes kept constantly on hand.

SHEET IRON PIPE.

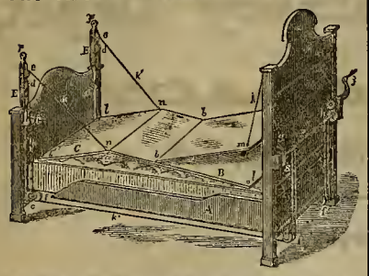
Lap-Welded Pipe, all Sizes, from Three to Six Inches. Artesian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.

Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.

Office and Manufactory, 130 Beale Street, San Francisco.

SHEET IRON PIPE.

The Archer Patent Invalid Bed.



By simple mechanical attachments the bed may be elevated, tilted, or adjusted to accommodate the invalid.

For full particulars see MINING AND SCIENTIFIC PRESS December 27th, 1879.

The adjustable bed bottom is put on top of the mattress, and by means of noiselessly operating cords and pulleys the patient may be put in any desired position.

The bed is adapted for persons in good health who wish an easy position, as well as it is for invalids.

This bed is of the latest improved form, with a view to simplicity, convenience and ease to the occupant.

A limited number of State and County Rights for sale.

Orders for the Patent Bed can be filled immediately.

Satisfaction will be given to those desiring to interest themselves in the manufacture or sale of this article.

OF IMMENSE PRACTICAL VALUE TO EVERY SAW USER.
GRIMSHAW on SAWS!
History, Development and Action; Classification and Comparison; Manufacture, Care and Use of SAWS of all kinds. Large Octavo. Over 153 Illustrations.

By ROBERT GRIMSHAW, Ph. D.,
Member of the Jury on Wood-working Machinery at Paris Exposition of 1878.

This thorough work, impartially written in a clear, simple and practical style, treats the Saw scientifically, analyzing its action and work, and describing, under the leading classes of Reciprocating and Continuous Acting Saws, the various kinds of large and small hand, sash, Mulay, jig, drag, circular, cylinder and band Saws, as now and formerly used for crosscutting, ripping, scroll-cutting, and all other sawing operations in wood, stone and metal, ice, ivory, etc., in this country and abroad. With appendices concerning the details of manufacture, setting, swaging, gumming, filing, etc., tables of gauges, log measurements from 10 to 24 feet, and from 12 to 96 inches, lists of all U. S. Patents on Saws from 1790 to 1880, and other valuable information. Elegantly printed on extra heavy paper, wide margin, copiously indexed

Owing to an increase of nearly 100% in number of pages and illustrations since first projected, the subscription price is this date made $2.00, postage paid, up to date of publication, after which time full retail price will be charged. In press. Orders received now at subscription price, $2.00.

ROBERT GRIMSHAW,
624, 626 and 628 Market Street, Philadelphia.
January 1, 1880.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, FEBRUARY 28, 1880.

VOLUME XL Number 9.

The Æsthetics of Labor.

Labor is not all drudgery. Some of its phases are of the most elevated character. Some of its conceptions rise above the lower grade of sturdy toil into the realms of sublimity. Some of its productions attain the most exquisite perfection. It does not always cling to the absolute of necessity; it reaches at times to the accomplishment of man's beatitude. It is not always a delver; it assumes when requisite the embodiment of the highest portraiture of excellence. It visits the toiler in dreams of marvelous felicity and presents to him visions of enchanting loveliness. It bears him from the harsh discipline of earth to the soothing freedom of celestial liberty. Under its æsthetic influence he is no longer a being of flesh and blood; he is transformed to an angel of light, and leaving his toil-strained muscles and thoughts upon earth he soars into the realms of ecstatic bliss and harmonious repose. In moments like this the materialization of his wildest dreams gives to his fellow men such dazzling gleams of supernal bliss, or such proofs of beneficial utility, as they had never before experienced, and opens to them a wide expanse wherein is ever to be found a solace for the harsh fatigue of strenuous toil. In proof of this, the delineations upon the canvas of the idealistic sentiments of the world's most renowned painters; or the creation from the quarry's rough block of the entrancing forms of beauty by the hands of sculptors of renown; or the soul-stirring thoughts of the poet's most harmonious song; or the swaying influence of the orator's exciting and well balanced words; or the almost vital machinery which the inventor has commanded into existence as the slave to perform tasks of utility for mankind; each and all, and even more than have been mentioned, can be cited without apprehension of rebuttal.

In the lone cabin of the solitary laborer where only desolation and privation are evinced, there hangs upon the rough and smoke-dimmed wall the artist's little sketch of a sunny landscape, in which the shadows of flowers and foliage fall lightly upon the bosom of the unrippled stream. As he looks upon the picture his somber home seems lighted by gleams from the view before him, and wafted by memory back to by-gone hours, his soul rejoices awhile in the glad presence of loved ones never to be forgotten.

In the scantily apportioned home of the daily toiler there rests upon a little shelf a plaster copy of some form of loveliness, which erst the sculptor's hand had wrought from inanimate marble. In the contemplation of this portrayal of beauty, he forgets his own rough life and this delineation of attractiveness holds him awhile entranced.

Upon the soiled table of the over-worked man there lies the poet's volume with its ennobling and soothing lines of sympathetic thought. In the rhythmic words and congenial sentiments he finds repose from his weariness and a balm for his sorrows and his griefs.

With his day's task performed and lingering on his homeward way, the artisan finds his very being stirred to its inmost depths and lifted out of this sphere of muscular exertion, as he listens to the eloquence of the orator whose sentences fall upon his ear.

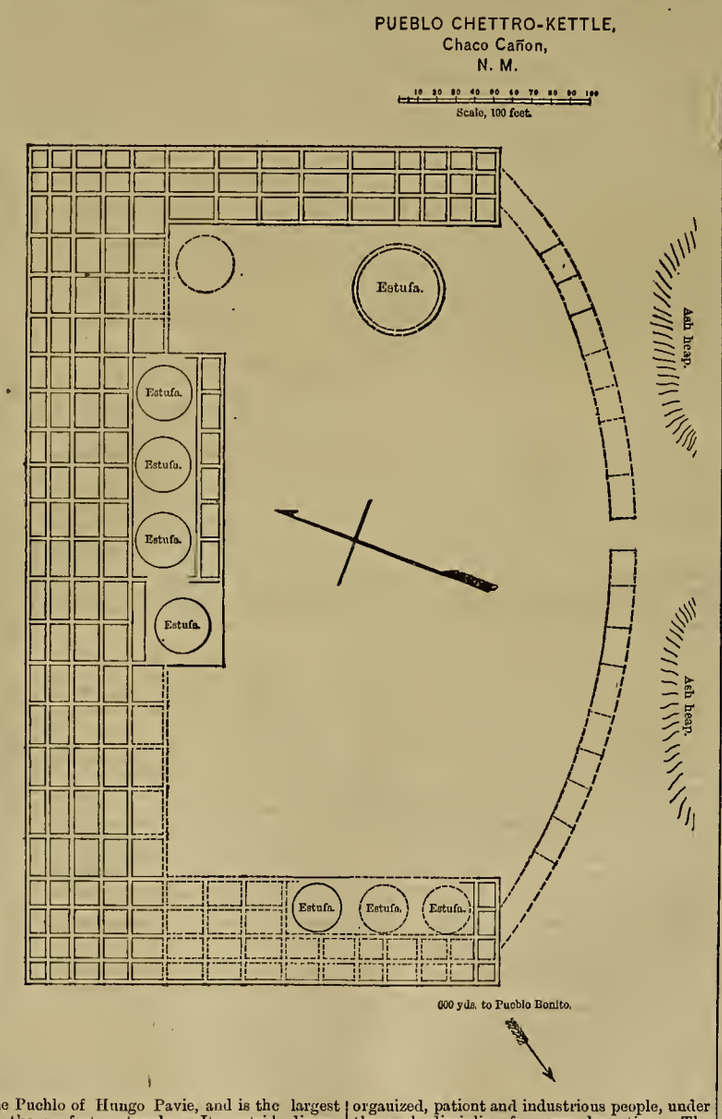
In the din of the factory there ever rises a pean to the honor of labor in the hum of the tireless and faithfully-working machine. Wherever the son of toil or even the slave of idleness may chance to be, there are to be found irrefutable proofs of the æsthetics of labor, for the producers of all these harmonious results have been and are diligent workers. What other of human efforts save those of labor could produce these wondrous effects; could awaken sensations of such pure unalloyed delight, or arouse the better moods of soul-life, that under the harsh pressure of the vicissitudes of existence were suppressed and forced into apathetic quietude?

In the wide field of labor there are those whose destiny is to delve and struggle, while others of their fellow workmen find their allotted tasks in the higher plane of æsthetic productions, whose harmony and elegance are intended to soothe, elevate and adorn their seemingly less gifted brethren. There is a grandeur in labor which elevates it at times to the higher grade of true æstheticism.

Pueblo of Chettro Kettle.

In recent numbers we have referred to the Aztec ruins in New Mexico, and given engravings of the ruins of the ancient towns. We give this week another illustration, showing the ruins of the Pueblo of Chettro Kettle, or the Rain Pueblo. This is of the same pattern as the Pueblo of Hungo Pavie, and is the largest of the perfect rectangles. Its outside dimensions are 440 by 250 feet. A semi-circular wall connects the two side wings. There are seven distinctly-marked *estufas*, four near the center of the main building and three near the end of the west wing. The walls of the Pueblo at the northeast corner are fully 35 feet in hight, showing four floors plainly and with indications of a fifth.

In this ruin there was at one time a line of wall running around three sides of the building, 935 feet in length and about 40 feet in hight, giving 37,400 square feet of surface, and as an average of 50 pieces of stone appeared within the space of every square foot, this would give nearly 2,000,000 pieces for the outer surface of the outer wall alone; multiply this by the opposite surface, and also by the interior and transverse lines of masonry, and, supposing a symmetrical terracing, we will find that it will swell the total up into more than 30,000,000, embraced within about 315,000 cubic feet of masonry. These millions of pieces had to be quarried, dressed roughly to fit their places, and carefully adapted to it; the massive timbers had to be brought from a considerable distance, cut and fitted to their places in the wall and then covered with other courses; and then the other details of windows and roof making, plastering and construction of ladders, must have employed a large body of intelligent, well-



organized, patient and industrious people, under thorough discipline for a very long time. The remains of the wall that inclosed the court show it to have been of stone and to have been divided into apartments.

THE North Noonday mining company forcibly took possession of the works of the Orient mine on Tuesday. A lawsuit is pending between the companies.

THE estate of the late Charles Bonner, once Superintendent of the Gould & Curry mine, and well-known in mining circles is valued at $300,000.

THE Dominion House at Ottawa has voted $100,000 for the Irish relief fund.

Effect of Labor-Saving Machinery.

The statement is frequently made that labor-saving machines deprive workingmen of employment. That they take the means of earning an existence from those who have to work for a living. The immense number of yards of fabrics which the cotton mills turn out annually are frequently made the basis of specious arguments to sustain the views of those who hold to that opinion. They state that if the cotton clothes were woven by hand looms, their manufacture would give employment to tens of thousands of operatives. There is no denying the fact that if the same number of yards of these goods that are now woven by steam or water power were made by muscular labor, that it would be as stated. But would the same quantity of goods be made in the latter case? Most certainly not. There could not be a supply of raw material placed in the reach of so many individuals to meet the manufacture. Or if we admit that such could be the case, the cost of production and transportation would be so great that they would amount to prohibition of the consumption. There could not be found purchasers enough who would be able to indulge in their use. There would consequently be a rapid decrease in the demand; the production would also meet with a like effect, and thousands of producers would be thrown out of employment. Nor would the producers only be forced into idleness. All the vast array of workers in every department of labor who now aid in the accessory spheres of action, which the raising and transporting of the cotton requires, would find their ranks rapidly thinned out. Commerce would be suspended; the working of metals now used in the machinery, in the means of production and transit, would cease; and there is not a branch of human industry but that would suffer. All this evil would be created upon the annihilation of even the one item of cotton manufacture by labor-saving machinery.

It would be still more marked if labor-saving machinery should be taken away from mining. If the pick, the sledge and drill—for they are the simplest of labor-saving implements—were abolished, how deep could man delve with the use of his hands alone? Or if they were still kept in use, how deep could the mines be sunk without the use of hoisting or pumping machinery? How much ore could be crushed were physical instead of mechanical power employed? What vast amounts of treasure would never be reached that now are brought from the depths of the mines. How few mines would be worked compared to the multitudes that are now in successful operation? How many thousands of busy hands would be idle that are now meeting constant employment? The products of the mines would be meager and unimportant. No deep work could be accomplished. In mining, certainly, labor-saving machinery gives work to tens of thousands that could not find it if such appliances were not in vogue. There would not be a mining camp in existence if mechanical work was annihilated. Where now the shrill steam-whistle utters its piercing shriek to call the miner to his toil or tell him that his hour of rest has come, there would be the utter silence and the oppressive quietude of desolation. Where now the powerful engine wields its mighty energies to perform its task, there would be stillness and immobility of unproductive inertia. No footsteps would fall where now the gangs of miners gather at the verge of the deep and darksome shaft. The boom of the underground blast would never be heard, nor would the sound of labor stir the open air. Mining would expire if divested of machinery. It is labor-saving machinery that sustains it, and creates work for the miners.

Look where we may, into any department of labor, and unless mechanical means are called to its aid it presents but a sorry aspect, holds but a trivial position, and counts but a very limited number of employees. But no sooner is machinery employed than its growth is rapidly extended and its ranks of workers greatly augmented. Labor-saving machinery not only increases the production, but it also opens a wider field for employment.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

A Sucking Fish or Remora.

Editors Press:—A remora or sucking fish, was not very long eince taken from the hody of a shark to which it had attached itself, and which had wandered into our hay. The Echineidæ or remoras are a very curious tribe of fishes. It is hy no means easy to say what is the true habitat of any of the species, for they fasten themselves by their sucker to any large swimming or floating object, such as a shark or a ship, for the remora isn't particular in its choice, and allow themselves to he carried wherever that object goes, so that the same species may he taken in localities thousands of miles apart.

But the remora is not a fixture like a barnacle; it can loose its hold at pleasure, and its object in attaching itself to a large carnivorous fish or to a ship, is the same ae that whioh attaches a oertain class of human beings to their richer or their more energetic neighhors. It is there for what it can get—for the crumbs and morsels of loaves and fishes which it has not the ahility to cateh entire or alive.

The sucker is not upon the uuder side like that of the family of fishes known as *cyclopteridæ*, of which we have two species in this bay, but is upon the back of the head, and con· eiste of a series of parallel transverse horizontal hars within a border or frame, and resemhling nothing so much as a section of a window blind. The action of these laminæ, the upper edge of which can he raised or lowered so as to change the angle, creates the vacuum which enables the creature to adhere. Precisely the same arrangement of transverse parallel laminæ occurs upon the feet of a large tribe of small lizards known as Geckoes, abundant in tropical regions. By them the Geckoes can walk along walls and on ceilings with the greatest assurance.

If now we look more closely at the remora, we shall find that in its general characteristics it resemhles that large class of fishes which have the anterior part of their dorsal fin composed of spinous rays, and the posterior part of soft and jointed rays; yet, curiously enough, it has no spines upon its back, bnt a soft-rayed fin only. What has become of the first or epinous dorsal? The answer will be given hy the sucker, which is simply a modified first dorsal, every bar or lamina representing a ray.

The eucker is in fact a heautiful example of that adaptation of existing parts to new uses which abound in organic life, and which are so many proofs of the evolutional unity of living heings.

When, in a given tribe of creatures haviug a certain definite structure, tho habits and environment of an animal necessitate a change in that structure, nature does not create a new organ, but alters an old one. The remora, unahle to compete with the swifter denizens of the sea, gradually became more and more of a commensal or hanger-on, and gradually became more adapted for such a life by tbe peculiar development of its first dorsal fin. In the cyclopterids or lump-suckere the same end is attained by the union of the ventrals into a circular sucking disk.

To give an example among mammals, the higher monkeys are specialized for climbing hy the power of grasping possessed hy all four of their extremities, which thus become hands. In many of the lower, which have the thumh so ahorted that the other fingers can only take a hook-like grasp, the tail comes into use as a fifth hand. The arboreal sloths, whose clumsy paws are quite a contrast to the hands of the monkeys, hold to the hranches hy their long reversed curved claws, which form a powerful hook, and most other climhing mammals ascend by the hold ohtained upon the inequalities of the surface by the sharp claws of all four of their feet.

W. N. L.

More new Mines.—The Tucson (Arizona) *Citizen*, of February 7th, contains the following: Some exceedingly rich mines have been discovered on the east side of the Graham mountains, in Stockton's pass, about twenty-two miles from Safford and twelve from Fort Grant. The first locations here were made hy B. D. Jones, hrother of Senator Jones, and since that time locations have been made hy others. The most important claims developed are the Delaware and the Pioneer. The ledge is two and a half to three feet wide and traceahle from 1,800 to 1,900 feet without a break. The assays are $2,300 in silver and $722 in gold. The claims are situated on the north eide and in plain sight of the main traveled road. The discoveriee have created considerahle excitement, and many prospectors are flocking tbere. One of Jones' mines, the Garibalda, carries magnificent gold ore, the shining particles heing visihle in every piece of rock. There is plenty of wood, water and grass in the vicinity, and a town site has already been located.

The bullion shipments from Salt Lake City continue to increase daily, and the prospects are that they will soon reach $200,000 weekly. —*Salt Lake Tribune.*

Slate Discovery in Kern County.

It is reported that Mr. Barker, of the Rio Bravo ranch, has found an extensive quarry of slate. It is on land helonging to the S. P. R. R., a few miles from the track. An expert was sent up by the company last week, and he reports it fully equal to that produced in the Eastern States or Europe. This species of rock formation is ahundant in thie State and in overy part of the world; hut the kind useful in the arts and mannfactures is scarce and of great commercial value if found where facilities for transportation exist. This is the first, we helieve, that has heen found in thie State in a situation where it could he made available.

According to the hest authorities on the subject, good slate is distinguished by an appearance of compactness and solidity in the blocks, with nothing to suggest their fissile character; and yet this should he so perfect that when fresh from the quarry the hlocks may he split with greater ease than redwood timber, and into sheets of any desired thinness. The faces should he perfectly smooth and parallel without any curvatures and irregularities. There should be no linee of cross fracture that should prevent their breaking in any one direction more than another, and when oue is halanced on the finger and struck, it ehould give forth a clear ringing sound. These characteristics are all exhibited in the rock taken from the surface of this quarry, an unusual circumstance in the best quarriee that have hitherto heen discovered and not occurring, as a general thing, until considerahle depth has been attained.

Quarriee of great extent have been worked in Great Britain from time immemorial, yielding immense annual revenues. Up to 1850, and even later, vast quantitiee of slate were imported into the Uuited States.

Subsequently quarries were opened in the New England States, Maryland, Pennsylvania, New Jersey and other places that have since mainly supplied the home demand, furnishing profitahle employment to great numbers and large iucomes to the owners. Thriving towns and villages have grown up wherever these quarries exist. One of these in New Jersey is called Slateford. The demand in the Eastern States for roofing slate is constantly increasing, shingles going more and more out of favor. It is not affected by changes of temperature like the coverings of metal, is fire-proof and presents an attractive appearance.

The other purposes to which it is applied are numerous. It is in great request for pavements, and various ornamental and useful articles are prepared from it. By a process of enameling that is carried on in an extensive scale in various establishments in Vermont, and in the cities of Boston, Philadelphia and other places it is made to imitate granite, marble, lapie lazuli, jasper, malachite, etc., and made into slabs, tiles and mantelpieces, and moldinge for interior decorations, and for articlee of furniture, such as tahle-tops, billiard tables, sinks, tubs for hathing, etc.—*Kern County Californian, Feb. 5th.*

Old Mowry Mine.—The Mowry mine was discovered and located by a Mexican in the winter of 1858-9, and was purchased from him for $10 hy Gen. Ewell, then Captain and commanding officer at Fort Buchanan. Work was done enough to demonstrate its extent and great value, and it was bought hy Lieut. Mowry for $25,000. Mowry went to New York, and succeeded in interesting a number of prominent men there in the property, and secured sufficient money to erect smelting works, and worked the mine with profit to himself and associates. He was arrested in 1862, while at the furnace, and in the hight of his prosperity. Gen. Carleton, of the California troops, made the arreston the pretext that Mowry was a Southern sympathizer. Mowry was sent to Yuma, and remained there many monthe. Carleton's troops happened to be old California miners, and started the furnaces, reduced the ores, and returned home "loaded with silver." After the troops left the property was leased hy Carleton to Garrey, who realized between $40,000 and $50,000 from it and drew out. It was then worked by others until Mowry returned to Arizona and disposed of the property to Mr. D. A. Bennett. Mr. B. worked it for three years, shipping to San Francisco large quantities of bullion. Work was then suspended, and a U. S. patent applied for as the Enterprise mine. The greatest depth sunk on the property is 400 feet—shaft 350 feet and winze 50 feet. The lowest level is 100 feet from wall to wall. It is a large and valuable deposit of low-grade carbonate ore, the ledge being traceahle for miles. It is 75 miles southeast of Tucson, in a rich mineral belt, and its history gives proof of its merits.—*Pima County Record, Jan. 24.*

Gold Discoveries at Copperopolis.—Correspondence Stockton *Independent:* The quartz mania has not abated, in fact, we think it is increasing in violence, and quartz, more quartz, ie all one can hear. Another rich strike has added fresh fuel to the fire, and it is now raging more than ever. Men, women and children have become infected with it, and our hills, valleys and ravines are teeming with the eager expectants of striking a "rich bonanza." The latest discovery made is rich almost heyond belief, the rock being *alive* with *gold*, and the dirt in which it is embedded, also. Scarcely a day passes without some one being made happy by the discovery of gold-bearing quartz, and we are in high good humor over the increasing prosperity (present and prospective) of our town.

The Debris Question Under Discussion.

The Joint Committee on Mines, Mining Debris and Water Rights held a meeting February 18th, in the Senate chamber, to hear the explanation of the hill introduced in the Assemhly by Brown, relative to the solution of the mining debris question, and also to propouud interrogations to the State Engineer, W. Hammond Hall, and Col. Mendell, U. S. Engineer. The Senate chamher was crowded with members of hoth houses, and miners and farmers interested in the solution of the great problem. Mr. Parks went over the causes which have in the past 30 years filled up the heds of the principal rivers of the State, the diffieulties hetween the miners and the farmers, and the means suggested for an adjustment of the trouble. The bill provides for the mapping out into three great districts of all the lands interested in the mining debris question, the mining and agricultural lands to hear an equal share of the cost of diverting the debris into the mountain gulches. He expressed the opinion that the dehris difficulty in the whole Sacramento valley could be settled for $5,000,000, and that the tax therefor would not be more than one-half of 1% of the valuation of all the property interested. He thought the figure would he below that percentage, and suggested an amendment to the bill that the amount should be limited in the hill to three-quarters of 1%. The heavy debris could be lodged in the mountains, and the lighter would he held in euspeusion in the rivers and swept out to the sea. The effect would be to scour out the rivers to their depth years ago, which would relieve the State from the danger of the recurrence of floods, besides adding between 300,000 and 400,000 acres to the lands capable of cultivation.

In reply to inquiries, Mr. Hall stated that the cost of holding back the debris would not be disproportionate to the henefits conferred, provided that mountain and valley alike were taxed. The bill, as he understood it, did not contemplate including San Francisco in the districts to be assessed, nor any of the counties south of it. He stated that work could he so far advanced this year as to protect the Yuha and Bear rivers and surrounding lands from debris.

Col. Mendell entered into a longthened explanation, stating that he thought tbat if the United States did not take this matter in hand the State certainly should. He was not prepared to state the cost of the work. He said, however, that if the tailings were uot taken care of, in the course of some years there would be no rivers, and that the plan of deopening the channel of the rivers, retaining the debris and reclaiming lands, would have to be a general one, else but little could be accomplished.

The Bulwer-Standard Mill.

This magnificent quartz mill consiste of 30 stamps, and ie built after the most approved plan. The ore will be run from the tunnel direct to the ore-house, into two large hins, where it will be hroken aud screened, falling into the main body of the ore-house that is connected with the battories hy automatic feeders, self-adjustable. These feeders are a model of mechanical ingenuity and well worth a visit. There are two distinct batteries of 15 stamps, parallel with each other, working from pulleys on the same shaft placed on a center shaft between the hatteries. The capacity of the batteriee is about 100 tons a day, depending on the character of the rock. The slum-tanks are ranged on each side of the amalgamating room and are supplied with centrifugal pumps, and hose to charge the pans. The pulp is carried from the hatteries to the slum-tanks in eluice-hoxes with openings over each tank to fill them, requiring hut one man on each side to fill the tanks and charge the pans. The pans are set parallel with each line of slum-tanks and are each furnished with a patent steam quicksilver pump. This pump saves handling of the quicksilver when cleaning up or charging the pans. Between the lines of pans is one open passageway giving plenty of room for working purposes. The engine that drives this mass of machinery is a 225-horse power Poppet-valve, set in a parlor adjoining the amalgamating room. It worke as smoothly and easily as a noiseless sewing machine, and is a splendid piece of mechanism, fitted up with tho latest improvements and handles the mill machinery with ease.

The boiler-room, adjoining the engine-room, is large and spacioue, with two sets of boilers, the steam drums as large as hoilers for ordinary use. Oae of the boiler furnaces is built after the old style, the other set is fitted up with Box's patent fuel-saving furnace. It is claimed to save one-eighth of the wood to do the same work as the old style of furnace. They are in use at the Justice mine, Gold Hill, for the past 18 months, and no doubt its competitor hy its side will soon be replaced by the Box patent. The arrangement of this furnace, or its novelty in patent parlance, is the partition fire wall that extends close to the boilers, an arched opening heing left on a level with the grate hars for draft, and extending hack to an overhanging wall. The grate hars are set at an angle and the coals from the furnace form a bed between the partitiou and the rear hanging wall; the draft carries the flames, gases, etc., over this bed of coals, a great heat being generated, igniting the gases and utilizing the heat for steam purposes; that with the old style of furuace passed away and up the smoke stack without igniting. It strikes us as heing a valuahle invention and one that must make a great saving in wood, and to mills or mines using large quantities this should be a material object.

Bodie can now boast of 114 stamps in active operation, and in a few days 10 more at the Spaulding mill will he started, when 124 etamps will be crushing away day and night. This will more than double the former yield of bullion from Bodie.—*Bodie News.*

Mining Tax in Nevada.

Below will be found the Assessor's report of tax on the net proceeds of the mines for the quarter ending December 31, 1879. The report makes the total tax of the mines $22,048.79; tailings, $302.27; total, $22,346.06. For the quarter ending September 30th, the mines paid taxes amounting to $13,266.04, and the tailings mills paid $1,340.98; total, $14,607.12. Excess of the December quarter over that of September, $7,748.94, heing an increase of over 50% on the whole amount, and over 66% on the yield of the mines.

An examiatiou of the two reports shows a remarkable falling off in the tailings, caused principally by the closing down of the Omega mill early in the December quarter. The main new feature of the present abstract consists in the fact that the Union appears in it for the first time, and showe the ore worked hy that mine to be of high grade.

Abstract statement from the quarterly assessment roll of the proceeds of the mines of Storey county, for the quarter ending Decemher 31st, 1879:

Mine.	Tons Ext'd.	Value pr. Ton.	Gross Yield.	Total Cost.	Net yield or Val. on which Tax Levied.
California	1,240	$35	$385,025	$230,301	$154,010
Con. Virg.	14,493	38	548,675	300,757	247,918
Con. Imp'l.	2,881	13	37,450	44,317	7,490
Monte Cristo	478	11	5,258	4,780	525
Justice	1,183	12	14,330	9,068	5,762
Ophir	4,380	56	245,163	300,781	93,965
Union Con.	5,201	52	277,283	277,979	110,913

A New Device for the Protection of Miners' Lives.—For a week now there has been in use at the Hale & Norcross shaft a simple hut effeetual contrivance for preventing miners ascending and descending the shaft from falling from the cage. The middle hraces of the cage have heen extended some eight or ten inchee and on one side eyes formed for hinges. Into these eyes corresponding hinges of a gate are dropped and the gate fastened on the other side by a pin from top to bottom. These gates have §-inch iron rods running up and down four inches apart, the tops and bottoms fastened into iron hars ½-inch by 1½-inch. The whole contrivance weighs 57 pounds, and costs, including the time of the blacksmith in making it, $11½. It is impossible for a man to fall from tho cage when it is in place. A small har of iron runs from tbe hrace to the bottom of the cages at the eides to prevent any one slipping through in that direction. These gates come up breast high, so that no one can fall over them, and still afford every opportunity for signaling while tho cage is in motion. Should anything occur which would make it advisable for the miners to jump from the cage to the timbers, the pins can he taken out in a second and the gates dropped down the shaft, as no one works in the hottom. This simply contrivance has every advantage over a gate ewinging out or in, since euch a gate cannot be used in the shaft when the men are on the cage, as it could not then swing in, and if swung out would strike the timbers and injure the men. The miners at tho Hale & Norcross have all expressed their entire satisfaction with the arrangement, and say they experience a sense of eecurity while going up and down which they never felt before. Two men have been killed at the mine within the last five months hy falling from the cage, and when the first was killed, Superintendent Deidesheimer ordered protection provided against such accidents, hut his orders were not carried out. It is safe to say that no more men will be killed in that way while this simple invention is in uee.—*Gold Hill News.*

Floating Island.—Among the many natnral curiosities of Tuolumne county it is not generally known that there is a "floating island." Up in the "Siskiyous," lying like a pearl in the great mountain chain, ie Squaw lake, a beautiful shcet of water now utilized by a mining company as a reservoir. For many yeare the lake has been a favorite and delightful resort for fishing parties, and contained nearly in its center an island, comprising about an acre of ground covered with luxuriant grass and a growth of willow and alder. It was never dreamed that the pretty little island was not terra firma, hut when the bulkhead across the outlet of the lake dammed up its waters, the island rose slowly until it had been elevated fully 16 feet above its original level. It would be a question for the naturalist rather than the geologist to determine the age of this floating island, as it is evidently made up entirely of decayed vegetation. Perhaps at some remote period the roots of a tree, uptorn hy the mountain storm, drifting out in the lake, formed the nucleus from which the island has grown, but it seems singular that it should have remained anchored aud unchangeable in its position. The locality is much frequented hy pleasure seekers who will bereafter notice the increased elevation.—*Jacksonville Sentinel.*

MECHANICAL PROGRESS.

Dephosphorization of Iron.

[Condensed from a portion of a paper read before the Society of Civil Engineers, of Paris, by F. GAUTIER, July 4, 1879.]

Dephosphorization is a problem of great importauce in metallurgy. In the proportion of 1% phosphorus renders iron easily fusible, s property precious in tha feundry, without deubt, but unfortuaately accompaaied hy a very great fragility. Oue-half per ceat. renders the ireu more malleahle aud easier to weld when het, hut the fiber is replaced by a flat grain without resistance.

In steel lew in carbon, 0.1% of phosphoras renders rolling impossible, prevents tempering and gives n brittle metal uafit for sny use.

Uufortuuately, phosphorus is of very common occurreace in tbe ores of irou. In the are tho phospharus is gensrnlly iu the state af phoephate of liaie or alumiaa. These phosphates aro not decomposnble hy heat, and are irreducible by carhon or carbonic oxide. In order to displace the phosphoric acid, the presence of silica is necesoary. This forms an earthy silicate, and then permits the esrbon, or carbonic oxido, to exercise ite reducing action aad to free the phosphorus.

In the blast furnaace aad in preseaco of an excess of iron, theee reactioas lead finally to the production of phosphuret of iron, wbich dissemiaatee itself through the motal. When the phosphorus is in the state of metallic phosphate, its reductioa takes placo without tbe iaterveatioa of silica, and at a lower temperature. It is thus that sll the phosphorus of the furaace burdea, ore, flux aad fuel concentrates itself in the pig metal.

Attempts at dephosphorization have been made in the Bohemian works, st Kladno, in which they sought to dissolve the phosphste of lime aud of alumina of the ore by scouriag with a eolution of sulphurous acid. They only succeeded in a reduction of 30%, and this at au expense of 30 fraacs ($6) per ton of metal. It was a cumbrous process, uot practical, and has heen almost forgotten. What is to be done, then? Attsck the pig metal direct. To be bettsr ahle to jadge of the real progress, it will be well to review the different methods employed.

Dephosphorization in Puddling.

In the reverheratory furnace, on a cast-iron bed-plate covered with oxide of iroa, tho metal ie kept in a liquid stste. The oxidizing action produced by the contact with the oxide of iron, by the free oxygen from the gsses of the hearth, and hy the air, which enters at the doors, is further fscilitsted by the energetic working of the metal, which reaewe the exposed surfaces. This coastitutes the work of puddling.

The most oxidizahle bodies, silicium and manganese, are the first to pass off in the elag. As to the phosphorus, the fiasl elimination of which generally attains to 60%, it is usually admitted that it is transformed in part into phosphate of iron, but ahove everything elee ite elimination is attributed to the liquation. When the metal clears itself of foreign elements that it contains, it hecomes less fusible, and passes into a solid etate in the midst of liquid slsg, which surrounds it. It is at this moment thst occurs the greatest purification during the puddling.

The liquation certainly playe a very important *role*, but the single process of the fusion of the iron in contact with the oxide of iron of the hed of the furnace, constitutes a dephosphorization of 40%.

Special Dephosphorization in Puddling with Manganiferous Iron.

When puddling has for its ohject the production af a specisIly pure iron, it is nccomplished by adding mangsnese. This is a very recent industry, which had its origin in Belgium, wbence it afterwards extended into Germany and a part of France. To the iron contsining phosphorus is added spiegeleisen in such quautities as to have in the mixture from 2% to 3% of maugaaese; then it is puddled at a high temperature. The presence of manganese retards the purification and increases the amount of necessary working. The waste or loss is not very great, because it is hidden by a considerable consumption of scrap iron, which is used to maiutain or keep up the furnace bed, but the dephosphorization is energetic and can attain to 97%. With an iron containing 1.6% of phosphorus, which, without manganese, would yield after puddling 0.6% to 0.7%, there is often obtained an iron which contains only a half-thousandth of phosphorus.

The Heaton Procese

Created some stir in England 10 years ago, and has been the object of very complete and interesting studies on the part of M. Gruner.

Into a cylindrical vessel of sheet iron, lined with refractory earth, is poured the molten metal. The bottom of this vessel is a plate of cast iron, or, hetter still, a piece of sheet iron, four millimeters thick, which is pierced by holes and dcstiaed to be melted down by contact with the molten iron, wbich then tumhles into a sort of caldron containing nitrate of soda. This salt is decomposed instantly, and produces compounds of oxygen and nitrogen, which traverse the column of liquid metal, and make it undergo in a few moments of time an energetic purification. An iron with 1.5% of phosphorus gave a half solid praduct, still hsving 0.6 to 0.9 of phosaphorus aad 0.14 to 0.16 of silicn. This was not cast iron, for the decarburation was considerable, and ncither was it wrought iron nor steel. The wasta was only 5% ar 0%, but the amount of nitrate used anght to be mere than 10%, in arder to obtain good results. Ia short, the process was iacomplete, expensivc, and cquld only furnish the first msterial for the manufacture of steel in the Martin-Siemens furnace; therefore it was aot used.

Here stops the account of meaus fer dephosphorization placed at tho disposal of metallurgists, nntil within the last few yesrs.

The Beseemer and Martin-Siemens Processes.

The Bessemer process gives ne purification whatever, but oa the ceatrary, a concentratiea of the phosphorus ia proportion to the waste. It is thus that with Cleveland iroa, contaiaing 1.46% of phosphorus, Mr. I. Lowthian Bell obtained steel with 1.62%, aud at the Essen Steel Works; with the same ireu, was produced a stesl contaiaiug 1.77%.

In the Martiu-Siemens process, which produces steel on the hed-plate of a reverberatory furnace by melting n mixture of cast irea and scrsp, either wrought irou or steel, there is the ssme coaceatration of phosphorus. Wheuce comes, then, this aaomaly?

The Theory of Dephosphorization

Is not yet complete, but we agree more or less ia ackaowledgiag that several conditians concur to produce purificatioa.

1. Oxidiziag actioa, for transforming the phosphorus into phosphoric acid.

2. Basic slag, in order to permit the absorptioa of silicn, whioh is of necessity encountsred ia nll metallurgical operntioas, and to facilitate the combiaatiou of tbe phosphoric acid produced.

3. Liquation, or the separation of the solid product from the phosphoric slag which proceed from the refiniag and flow off in a liquid state.

Finally, the temperature, to which of late has been attributed a certain iafluence, either that its elevation decomposes the phosphates produced, or, rsther, that the basic affinities of the silica are quickly excited and set the phosphates at liberty.

All these conditions certainly have not equal iafluences, hut each seems to have its own.

In puddling we meet an energetic oxidizing actioa, produced as much hy the action of the peroxide of iron which constitutes the furnace lining ss by the peroxidizsd slag under the influence of free oxygen contained in the products of comhustion. The air entering at the doors is nnother cause of oxidation which we must not forget. The hasic state of the slag is not doubted, since the hed of the furnace is entirely covered with oxide of iron, and as the slag *en presence* contains commonly 10% to 12% of silica, and rsrely more than 20%. As to the liquation, it is chsracteristic of this operation; there hss heeu, perhsps, an exaggerated importsnce attached to this portion of the process in explsining the elimination of phosphorus; some one has even gone eo far as to say that wrought iron formiug (or "coming to nature") in the midst of a phosphoric slag is like ice, free from eslt, heing formed by the freezing of sea water. The temperature in puddliag is relatively low; moreover, it has heen found in the treatment of certain iron, very high in phosphorus, that it was important, in order to obtsin a good purification, not to have the heat too intense. We see, then, thst in puddling, all the conditions more or less known as necessary to dephosphorization are to a great measure fulfilled, and make of this process an energetic method of purification.

The Heaton Process.

In the Heaton process what do we find? The oxidizing action, although of short duration (it lasts only from two to five minutes), has here an intensity péculiar to this process; it is an explosive, instsntaneous action, utiliziag the oxygen ss eoon as it is free, or feebly combined with nitrogen in essily dissociahle products. The slag is hasic, for it contains a minimum of 30% of soda, which has powerful affinities, and 10% or 20% of oxide of iron; it also contains sometimes 54% of silica. The product was pasty and only half fluid; there was a kind of liquation, which did not show itself in any way except when the spongy metal, filled with slag, was reheated and hammered. Finally, the temperature is relatively low, and certainly would not psrmit the phosphate products being decomposed either by the heat alone or hy the exaltation of the basic affinities of the silica. This is certainly a group of favorable conditions.

It will not he the same if we consider the Bessemer operation. Althongh the oxidizing action is of an extraordinary intensity, the slags are very silicious, containing from 40% to 50% of silica, which is derived as much from the silica of the metal as from the lining, essentially silicious, of the converter. As to the temperature, it is excessively high, and we can ressonably believe, as regards this portion of the process, that it is sufficient to prevent all stable combinations of the phosphoric acid with the slag. These conditions certainly do not constitute a satisfactory *ensemble* when dephosphorization alone is considered, and we can scarcely be astonished that the purification amounts to nothing in either one or tbe other of these processes for the manufacture of steel. One can even go further, aud say that

The Most Prominent Metallurgists had Lost Hope

Of applying to steel any method of dephosphorization. In prssaues of theso difficulties, that neither the chemist nor ths empiricist seemed able to surmonat, we had tsken up with iuterest a solution wbich permitted leaving iu the stcel a praportion of phosphorus five or six times greater than what had beaa thought possible before tbis.

M. Euverte explsined, seme years ago, how, thanks to the employment of ferro-maugaaese, a reducing ageat mere cencentrnted nnd euergetic than spiegel, tho final oxidation of the metallic bath in the Bessemer aud Martiu-Siemens processes, could be raissd witheut iatroduciag into the steel so large n quantity of carben. He showed, alse, how the dimiaution of carbon permitted leaviag in the steel three or four thousandths of phosphorus without injnriing the praduct sufficieutly to prevent its beiug used for rsils. This was a vast field opened to the employment of iron rsils, for their conversioa in the Msrtin-Siemens furnace into steel rails of a good quality, eoutaining phosphorus; but it wae net the dephespherizatiou of impure pig metal.

SCIENTIFIC PROGRESS.

THE THERMOPILE.—Among the reccat iaveations by Mr. Edison, who, it eeems, ie not altogether absorbed in his electrio light experiments, is that of what he calls the thermopile, desigaed for tho measurement of iafiaitesimal degrees of heat. He describes the instrumont in the followiag words: "It consists of a carbon button placed between two metallic plates. A current of electricity is passsd through one plate, then through the carbou aad through the other plate. A piece of hard rubber or of gelatine is so supported as to press sgainst these plates. The whole is then placed in coancction with a galvanometer and an electric battery. Heat causes the etrip of hard rubber to expand and press the plates closer together an the carbon, allows more current to pass through and deflects the needle of the galvanometer. Cold decreases the pressure. Moisture near the etrip of gelatine can be measured in the same way hy increasing or decreasing the pressure, aad accordingly deflecting the needle. By means of this apparatus, or one combined with sensitive electrical galvanometers, it is possible to measure the millioneth part of a degree Fahrenheit. Infinitesimal changes in the moisture of the atmosphere csn he indicated in the same way—changes which are a hundred thousand times less in quantity than those that can be indicated hy the present harometer. It will thus foretell a storm much more readily. The carbon hutton I have in this instrument is of lampblack burned from rigolene."

CHLORIDE OF METHYL.—M. Camille Vincent has proposed, and advanced to successful experiment, a new process for extracting essential oils hy the use of chloride of methyl. The process is bssed upon the property of that suhstance to dissolve fats, rosins and essential oils. The first experiments eucceeded so far as the extrsction went, hut the product ohtained had a disagreeahle odor, caused by the presence in the commercial chloride of methyl of traces of some impurity. This impurity he succeeded in eliminating hy treating gaseous chloride of methyl with concentrated sulphuric acid. He extracts the perfume from flowers in the following way: They are digested for two minutes with successive charges of chloride, repeating the operation a number of times. Finally, the digesting vessels are exhausted, and the chloride, which carries with it the volatile esseatisl oil, is obtained in a gaseous state. This mixture is condensed, and the resulting liquid is heated to 86° Fahr. in a vessel from which the chloride of methyl is exhausted hy means of a vacuum pump. The chloride is thus separated from the perfume, which is contaminated hy fatty and resinous matter. The latter ie extracted hy meaas of alcohol.

A NEW CHEMICAL PHOTOMETER.—Herr Eden, in a communication to the Vienna Academy of Sciences, gives the details of a new chemical photometer, which is hased upon the observation that chloride of mercury is very easily reduced to insoluble chloride in sunlight whenever it is mixed with organic substances. The sensitive solution he uses consists of two volumes of a solution of 40 grams of oxalate of ammonia in one liter of water, and one volume of a solution of 50 grams of sublimate in one liter of water. In sunlight turhidity is immediately produced, the action of the light being weaker as the solution is more dilute. Herr Eden has furnished tables for the corrections necessary to allow for the influence of increasing dilution and varying temperature on the quantity of the chloride of mercury separated hy the photochemical process of decomposition.

METEOROLOGICAL observations have now become so extended that evidence ie rapidly accumulating to enable us to determine positively the source of the cold, aerial waves which sweep across our country during the winter season. The indications are that we owe them to the great area of high harometer in northeastern Siheria, where the pressure sometimes exceeds 31·50 inches and the temperature falls as low as 76° below zero.

SHOEMAKERS' WAX TO ILLUSTRATE THE FLOW OF SOLIDS.—Our foreign exchaages notice the following curious experiment: Lsst ysar Sir William Thomson commenced a new snd curious experiment oa shoemakers' wnx as a viscous material. A lsrge circulnr cake of it, about 18 inches ncross and 3 inches thick, was made; this was put into a shallow cylindrical glass vessel, which was filled with water to keep the temperature from vsrying with any great degree of rapidity. Below the cake a number of corks wore put, and ea the top there were placed some lead bullets. The rosult has been tbat, ia a yesr, tho corks have floated np through the wax, and are comiag out at the top; the bullets have sunk down through the wax, and have come out at the bottom; and this, it is to be observed, hss goae on while the wax wss at all times in such a coadition as to be excessively brittle to auy force suddenly applied, such as a blow from a hammsr, ar such as would be occasioned were the cske of wax to he nllowed to fall oa a steae fleer. Mr. J. T. Bottomley has bsea also experimeating with the same material, and has constructed miaiature glaciere in wooden chsaels, which present all the pheaomena of flow seeu in real glacisrs.

PHOSPHORESCENT PHOTOGRAPHS.—Dr. Woodbury is the inveator of a simple aad effective method of producing phosphoresceat photographs. He exposes a plate costed with a mixture of dextriac, hoaey aad bichromate of potash under a negative, the result beiag that those portions which are exposed to the effect of the light through tbe transpsrent portions of the aegative hardea, while those which are protected from the light remain adhesive. The lines of the image, therefore, will retain any fiae powder which is dusted over it, while the lead portions will not retaia it. Dr. Woodbury uses as a phosphorescent powder, sulphite of lime, which, adheriag to the unchanged portions of the film, will produce a picture thst can hardly be distiaguished in daylight from an ordinary photogrsph, bscause the substsnco used is almost entirely white. In the dsrk, however, having boen exposed to sunlight or any etrong artificial light, a luminous picture will be produced which is said to be very striking.

A NEW FLUID FOR PRESERVING ORGANIC SUBSTANCES.—The Prussian government hss published the recipe of a fluid for preserving organio suhstaaces, discovered by Prof. Wickersheimer. The *Scientific American* states that Prof. Barbeck, at a recent meeting of the Philadelphia Academy of Sciences, described tbe wonderful effects of this fluid, which has the power of preserviag not slone the color and form, but also the elasticity of vegetable or animal tissues which may he prepared hy immersion or injectioa. The formula for the prepsration of the fluid is ae follows: In 3,000 grams of boiling water dissolve alum, 100 grams; common salt, 25 grame; ssltpeter, 12 grsms; carboaate of potash, 60 grams; arsenious acid, 10 grams, After cooling and filteriag, add to every 10 liters of the solution four litere of glycerine and one liter of methylic alcohol.

A TELEPHOTE.—A Chioago *Tribune's* Pittsburg special says: Application for a patent in connection with a telephone was forwarded hy a gentleman of this city. The clsim is its sbility to transmit physical wave force of light electrically, similar to the trsnsmission of sound hy telephone. It is claimed that when the new invention is simply perfeoted for practicsl uso, it will be possible for one of two persons conversing hy telephone to perceive distinctly at the same time the image of tho person with whom he is conversiag. Tbe practical utility of the invention will be more thoroughly apparent when it is stated that the inventor helieves he will he shle to transmit from point to point any written or printed documents, for instance, the entire side of a newspsper.

EXPERIMENTS UPON HUMAN HEAT.—Hirn has supplemented his hrilliant thermo-dynsmio experiments hy an application of his method to the human orgsnism, in order to ascertain its mechanical equivaleut. He finds that in the normal condition, while the heat of the body is increasing or decreasing, every 425 kilogrammeters (3,074.084 foot-pounds) of work costs or hrings to the organism a unit of heat. By comparing the heat which really appears or disappeare with that which ought to appear or disappear, we can study what is going on in our hodies, and how they are modified hy the conditions in which they are placed. The laws of mechanical physics may thns teach ue how and how much our organism differs from an ordinary machine.—*Comptes Rendus.*

A MAGNET CAPABLE OF LIFTING THREE TONS. Mr. C. Belly, of Indianapolis, has lately made an 800-pound electro-magnet. The two iron cores are four inches thick hy 30 inches long, and slide along a yoke 18 inches in length, so as to vary the distauce of the poles. The two coils around the two cores consist of eight layers of isolated No. 6 copper wire, and the terminals are so arranged that the electrical current may be sent in various ways. Pole extension for diamagnetism is provided, and the various experiments for which it is adapted are almost numherless. This magnet was made for Prof. Jahn, of one of the schools in Indianapolis.

Mining Share Market.

The legislative antagonism to stock transactions and mining operations has created a stagnation in the market, and the supreme dullness which exists is the result of such interference. There has been no stability in prices; fluctuations have been too slight to demand special notice; while the general tendency has been downward, and continues so to this date.

In contrast to our own market, we would call attention to the operations in the boards of the Eastern cities. Where sales are very brisk and rapidly increasing in volume. The restrictions which press so heavily here are unknown there, hence the marked difference in the market tone of the two sections of the Union. Some of our leading stock operators have already left for the New York field, and we learn that others are preparing to follow their example. With them goes their wealth and influence, and if this legira is continued it will dwindle the market down to the meager operations of only tho men of very small capital. At present there does not appear to exist either the cause or ability to start a first-class boom.

Mining Law Amendments.

The bill to amend Sections 2324 and 2325 of the Revised Statutes of tho United States, concerning mineral lands, has passed Congress and is now a law. It reads as follows:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, that Section 2325 of the Revised Statutes of tho United States be amended by adding thereto the following words: "Provided, that when the claimant for a patent is not a resident of the land district whereiu the vein, lode, ledge or deposit sought to be patented is located, the affidavits required to be made in this section by tho claimant for such patent may bo made by his, her or its authorized agent, when said agent is conversant with the facts sought to be established by said affidavits; and, provided that this section shall apply to all applications now pending for patents for mineral lands."

Sec. 2. That Section 2324 of the Revised Statutes of the United States be amended by adding the following words: "Provided, that the period within which the work required to be done annually on all patented mineral claims shall commence on the 1st day of January succeeding the date of such claim, and this section shall apply to all claims located since the 10th day of May, A. D. 1872."

Bullion Shipments.*

Since our last issue, we have noticed the following hullion shipments:

Ontario, Feh. 13, $3,923.15; Feb. 16, $8,562.99; Feh. 17, $4,348.33; Feh. 18, $4,055.17; Feb 19, $4,386,48; Feh. 20, $4,415.45; Feh. 21, $3,990.22; McCormick & Co., received Feh. 16, $18,941; Feh. 18, $11,977; Feb. 20, $20,107; Alexander, Feh. 9, $3,687.83; Feh. 11, $1,776.73; Feh. 13, $3,031.61; Richmond, Feh. 17, $16,429.42; Feh. 20, $16,516.35; Eureka Con., Feh. 22, one week, 242,145 lbs.; Christy, Feh. 16, $5,395; Feh. 18, $1,614.27; Paradise, Feh. 16, $3,664.23; Feh. 21, $3.694.81; Horn Silver, Feh. 13, $7,500; Feb. 18, $20,000; Feh. 19, $5,000; Wells, Fargo & Co., at Eureka, Feh. 19, $1,600; Feh. 21, $1,000; at Silver City, Idaho, Feh. 8, $10,671; Buffalo, Feh. 8, $28,797; Corbin, Feh. 14, $6,238.19; Leeds, Feh. 18, $5.995.12; Con. Virginia, Feh. 21, $64,690.60; Union Con., Feb. 21, $48,461.28; Ophir, Feh. 21, $141,533,67; Argenta, Feh. 23, $11,500.

*Desiring to make our list of Bullion Shipments as complete as possiblo, we will be thankful to receive from mining Superintendents and Secretaries notice of all bullion shipments from their respective mines.

THE FOOD SHIP FROM AUSTRALIA.—At the departure of the last mail from Sydney there was lying at the dock a vessel chartered by the colonial government to carry to England, food preserved from decay by any process which claimed to leave it in a "fresh" condition. There had already been fitted up in the ship apartments for testing a refrigerating process. Visitors were shown meat in frozen condition, when it is as firm as wood, and there was also illustrated the effect of the refrigerating process on fruit, showing that oranges and apples could he frozen as firm as cricket halls. Artificial snow and frost were also produced. It was suggested that advantage should he taken of the departure of the *Strathleven* with her freezing apparatus to ship other products besides beef for the English market. The experiment of sending butter to England failed when tried before, because the article was spoiled on the voyage; hut it was thought that it could he safely sent if kept at feezing heat—so to speak. The results attained by this experimental cargo will he looked for with interest.

THE President has nominated Rowland E. Trowbridge, of Michigan, to be Commissioner of Indian Affairs.

PLIMSOLL has apologized to the British House of Commons for the language contained in his recent handhill.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

MONTERICHARD.—*Dispatch*, Feb. 21: Everything about tho mine is looking well, and a new drift will bo started in the 450 level.

NEW STRIKE.—Messrs. Wilson & Kittridge have discovered a new ledge about a milo below the Monterichard. It is a well defined ledge, three ft wide, and has been traced about 400 ft, the vein running north and south.

BUTTE BANK.—It is reported that a bed of very rich gravel has been struck in this mine. We are glad to be able to record this streak of good luck on the part of the proprietors.

ITEMS.—Tho Kelly claim and tunnel near Murphy's gulch is being worked once again. W. H. Kruger is developing his claim with the view of getting a patent on it, when capital will be forthcoming with which to thoroughly develop it. Mr. James Morgan has negotiated for the claims of Mrs. Holtz and Mr. Paul, in Murphy's gulch, and will soon commence work upon them. Mr. I. N. Dewitt is moving all of Murphy's ridge that he can get away with, and if report speaks true, he is doing well by the operations.

YELLOW JACKET.—The Yellow Jacket company, on Dry creek, are sinking on a very fine looking ledge, which is fully as wide as the shaft, and prospects very encouragingly. This mine adjoins the Crown Point on the south.

ASBESTOS.—*Ledger*, Feb. 21: Some two years ago we mentioned the discovery of an asbestos deposit on Stony creek, four miles west of Jackson, by S. V. Carter. The property is now held by Boon Bros., lately settled in that vicinity. They are opening up the claim gradually, working on it at intervals. They inform us that the asbestos is improving in quality as they get deeper.

NEWTON COPPER.—At the Newton copper mine, a lively aspect prevails than has been seen for years past. There is a strong force at work, both above and below the surface.

ITEMS.—Nothing is doing at the Talisman, except keeping down the water. The Original Amador is running a reduced force of men. The Oover mill is idle, and a small force of miners is employed in the mine prospecting.

BUTTE.

FEATHER RIVER.—*Record:* This stream in early days yielded an immense amount of gold, hut for several years past the water has been diverted from its bed so that not enough was left to run the necessary pumping machinery and do the washing, but within the past two years the hurdy-gurdy wheel has been brought to the aid of the miners, and by purchase of a few inches of water from the Feather river and Ophir ditch, the claims can bo drained at less exponse and work commenced much earlier in the season than when the whole volume of water was in the river.

CALAVERAS.

GWIN.—*Advertiser*, Feb. 10: Everything at the mine is progressing to its fullest capacity, a large number of operatives being employed. The rock now being taken from the north shaft is steadily improving in quality, and that taken from the 500 level, south shaft, is rich in sulphurets and free gold. At a distance of 180 ft from the shaft a 12-ft wide lode is developed, and the indications are that to the south lies a bonanza.

MARIN.

SAN RAFAEL.—*Journal*, Feh. 10: The tunnel will strike the ledge at 160 ft in the hill. A shaft will bo sunk on the ledge to the tunnel, 254 ft below the surface. A tramway will be built from the top of the shaft to the mouth of the tunnel, to carry what is taken out in sinking tho shaft. The mill site is about 400 ft from the mouth of the tunnel. The mill is building by a separate company in San Francisco, under a contract. The tunnel is in 122 ft, in black spar, with indications that the ledge is close at hand. About 700 ft of 3-inch water pipe have been laid to connect a spring with the buildings. It is the intention of the company never to list the stock. They are satisfied with what they have in the mine.

MARIPOSA.

RIVER TUNNEL AND MINE.—*Gazette*, Feb. 21: There are two levels, the 400 and the 500. At the 400 the vein is developing, some eight or ten ft wide and is increasing as the work progresses. About two ft of the vein lying against one of its walls is very rich and estimated to be worth from $200 to $300 per ton, while the average of the whole vein is estimated at $30.

SILVER AND GOLD.—Recent developments made at the silver mine about five miles southeast of this place, near L. A. Munroe's ranch, is exciting considerable interest. Some few months ago parties commenced prospecting the vein (which was known for many years to contain silver, but supposed to be quito limited), and now find the rock contains silver and gold in nearly equal proportions.

MONO.

BELVIDERE.—*Free Press*, Feh. 21: This mine is situated on the southern slope of High peak, its northern end reaching nearly the top of that eminence, while its southern extremity extends to the sag which divides High peak from Silver hill. It is sandwiched between the Bulwer Con. on the east and the Con. Pacific on the west; is 1,500 ft in length and of varying width, from 200 to 320 ft. The working shaft is situated 1,000 ft south of the north line, and 500 ft south of the old works. It is a double compartment, and is down 400 ft. A level was run at 300 ft in which a rich body of ore was cut 170 ft from the surface. Fifteen ft below this level the ledge appeared in the shaft, and continued until witbin 20 ft of the bottom, where it pitched out to the east, coming in again at the 400-ft station.

BULWER CON.—The north drift on tho Ralston ledge is in 60 ft. The ledge is three ft wide, of good ore. The south drift is in from the tunnel 69 ft. The ledge is three ft wide and looking well. The north drift on the Stonewall ledge has a total length of 07 ft, showing a ledge in the face 18 inches wido, of very good ore. The south drift is in 63 ft. The ledge is two ft wide, of good ore. The stopes on the Ralston ledge are looking well. The ledge is three and one-half ft wide, of high-grade ore.

STANDARD CON.—The main shaft is down 704 ft. The rock in the bottom continues very hard. The crosscuts, 700 level, are making the usual progress. The north drift from the east crosscut, 500 level, is in 40 ft. The ledge is two ft wide, of good ore. The south drift, 385 lovel, is now in 355 ft from the crosscut. The ledge is about two and one-half ft wido, of good ore. The upraise on the Cook ledge is four and one-half ft wide, and looks well. The north drift on the east ledge 300 level, incline, is in 160 ft, showing a ledge two and one-half ft wido, of good ore. The south drift from the west crosscut is in 184 ft. The ledge in this drift is three ft wide, of rich ore. An upraise is above this drift 24 ft, where the ledge is three ft wide, of good ore. The drift, 550 level, is in 280 ft; the ore is of a good quality, and is four ft wide. In the stopes, north drift, 385 level, the ledge is 25 ft wide. In the West Standard stopes the ledge is four and one-half ft wide, and is looking well. In the stopes on the Gildea vein the ledge is three and one-half ft wide, and looking well.

CON. PACIFIC.—The main shaft is sunk to the 500 level, where a station is being cut out. The formation at the 500 level is of a most favorable character, and more easily mined than on the 400 level. Work on the 400 level is going forward as usual; running main drifts north and south, preparing to crosscut the veins both to the east and west of the line of these drifts. The north drift is in 133 ft, and the south drift 122 ft from the 400 station.

SUMMIT.—The north drift, 530 level, has a total length of 94 ft. The ledge is two ft wide. The south drift has a total length of 101 ft. The rock in both drifts is pretty hard.

DOUBLE STANDARD.—The north drift has a total length of 33 ft. The rock in this drift is very hard. The south drift is in 145 ft.

SILVER HILL.—The tunnel is now in from the west entrance a total distance of 520 ft, and from the Ore main shaft west 171 ft, and east 188 ft.

HARRINGTON.—The winze is down 82 ft. The three-ft vein in the southeastern inclination has passed to the east side of the winze; bird's-eye porphyry in the bottom, with favorable indications that the porphyritic syenite, which forms the hanging wall of the La Grange ledge, will soon be reached. This ledge, as explored by the tunnel, yields assays from a trace to $26 gold. The winze was connected perpendicularly from the level of the tunnel at a point calculated to strike the main ledge at a depth of about 120 ft.

UNIVERSITY.—The shaft is down 341 ft. The ground is softer, and is filled with seams of clay and quartz. The shaft will be continued to a depth of 500 ft before crosscutting, when exploring drifts will be run east and west to intersect the ledges opened up at a depth of 328 ft in the old works. This shaft is one of the most substantial in the camp, being a triple-compartment four ft three inches by four ft three inches in the clear in each compartment, timbered with eight by eight square sets.

TIOGA.—The main shaft is down 785 ft. The rock continues very hard, standing vertical. The stringers of silver-bearing ore continue to improve as depth is attained. Syndicate drift is in 087 ft. The face of the drift still in hard ground. East crosscut from Ralston winze, 020 level, is in favorable vein matter. The upraise, on vein No. 3, has now reached 121 ft, incline measurement.

QUEEN BEE.—Bodie *News*, Feb. 21: The north drift from the east crosscut, 400 level, is in a total distance of 25 ft. The face is in ledge matter of a very favorable character, with frequent bunches of rich ore scattered through the ledge. At a point 85 ft north of the main east crosscut, a cross drift was run to the footwall, a distance of 10 ft; a small seam of good-milling ore two ft wide was found on the clay selvage of the footwall.

SOUTH NOONDAY.—The shaft is down 153 ft. It is expected the Sand Bank ledge will be cut at the depth of 225 ft. The shaft will be continued to the 250 level, when a station will be cut out and crosscuts run to the ledges.

NEVADA.

MONICAN.—*Transcript*, Feb. 24: A crushing of 42 tons of ore yielded in free gold $1,000.18, besides four tons of sulphurets assaying $33.05 a ton. The average yield per ton was therefore about $30. Most of the ore was taken out in sinking the shaft, which is 140 ft deep, and from the 120 ft east drift. There are sixty tons of the same character yet on the dump. The first crushing paid $12.50 a ton; the second, $14.57; and as wo have shown above, the last about $30.

EL CAPITAN.—*Transcript*, Feb. 19: The permanency or richness of the property cannot be determined without sinking 100 ft below the present depth of 150 ft. The walls are now 50 ft apart. Two promising chutes of ore exist on the 150 level.

COE.—It is situated on the Red Dog road, near Nevada City. From 50 to 60 tons of ore has been produced, 33 tons of it paying $34 per ton, and the remainder $20.

HIRSCHMAN.—Nevada *City Herald*, Feb. 17: Is working day and night, and uses 800 inches of water. The claim has for years been on a good paying basis. The largest clean-up amounted to $17,000. It is not many months since when between $7,000 and $8,000 was the result of 45 days' washing. The monitor used throws a stream of 750 inches, one of the largest of its kind that is manufactured.

NEW YORK HILL.—Grass Valley *Union*, Feb. 22: A dividend of 25 cents per share is announced. This will amount to $9,250, being on 37,000 shares—the remaining 13,000 of the 50,000 shares of the capital stock being owned by the company. This dividend is paid out of the surplus of earnings that have been made in doing dead-work and opening the lower levels preparatory to getting in shape. The developments have been the extension of No. 9 drift north, No. 10 drift south, and sinking of the main incline. A new chuto of pay ore has been found on the No. 10 level. The last crushing of rock averaged $150 per load, and amounted to $11,000. No. 9 drift north, No. 10 south, and No. 11 north and south, are being driven, while the main incline is being sunk for another level.

CENTENNIAL.—A clean-up of 100 loads of rock, with the sulphurets, gave a yield of $8,000, or $80 per load. Another crushing of rock is accumulating on the dump.

PLUMAS.

NORTH FORK ITEMS.—Quincy *National*, Feb. 14: Some prospecting is being done at Dutch Hill. Wentworth & Co. are prospecting a new claim on a bar above Horseshoe point, and will bo likely to develop a good paying claim. They are well provided with everything necessary to open the mine, having a large water derrick and other conveniences. Brewster & Co. are running a tunnel and bringing water to a bar in the same neighborhood. This is all new ground which has never been prospected for the reason that it was difficult to open, and there are good reasons for believing that it will turn out well. The Sunnyside Co. have the tunnel in about 800 ft. They lost bedrock some time ago, but with the aid of a pump have managed to get down to it, and find some pay where they are working. The bedrock is raising, and will soon be up on a level with the tunnel. Cariboo is going along as usual. Orton & Keep have been making some money, and have good prospects for some more. Wilson & Moore have also been doing well. Thompson & Mather are getting fair pay for their labor.

PLACER.

WEST DAMASCUS GRAVEL.—*Argus*, Feb. 21: Tho shaft was sunk to a depth of 140 ft. from the surface, at which point a tunnel was run 100 ft, and a raise to gravel. Here the bedrock was found still pitching, and work was resumed in the bedrock tunnel and pushed 100 ft, and another raise put up to gravel, at which point some very good looking gravel was found, but the bedrock was higher than in raise No. 1. Gravel tunnels were then started from raise No. 1, one of them running due east and the other running northwest. The east drift has been run 100 ft, and the northwest drift 140 ft. The bedrock has been found nearly level in both drifts, except for the last 15 or 20 ft of the latter drift. They are losing the rock and better looking gravel is coming in.

ITEMS.—The Homeward Bound is the only claim at present washing, and judging from the roaring it makes, they must have some very hard dirt. The Hobson & Mitchler claim at Independence hill have worked one or two days this season, but are now laying off for want of water. The Morning Star have put off two bank blasts lately, and are now waiting for water to wash them off. The Scott, a mile below Newcastle, west of the railroad, is down 80 ft, and though the ledge is comparatively small at that depth the rock prospects quite favorably. Tho last crushing went $12 to the ton, and the ore now being taken out is thought to be much richer. The new 100-ft shaft and sump of the Mammoth Bar mine were completed on the 18th ult. The now 10-inch pump, working one hour in six, clears the mine of water. The drift is in 80 ft, and the upraise is up at a point 75 ft from the shaft.

SACRAMENTO.

SACRAMENTO DEEP GRAVEL.—Folsom *Telegraph*, Feh.21 Is in the bed of a deep river channel underlying a high gravel ridge, well defined, and extending for miles in a direction north of east, and south of west; its rim rocks are visible in places showing a width of channel from 100 to 250 yards. Their excavations have proved this chaunol to be very rich. It extends so far as their work has been prosecuted. This company commenced work some three years ago, and they are not as yet troubled with much water. Pay is found to extend from its outer or northerly rim towards the center of the channel, a distance of 150 ft. Crosscuts have been extended up and down the channel and found pay dirt that prospects from 5 cents to $12 to the pan; pieces are found of the weight and value of from 25 cents to $10, and quite a percentage is what may be called fine, yet it is heavy gold, heavily coated with a black substance somewhat resembling stone coal, such as is usually found in old channels called lead gold, and coins $19.40 to the ounce.

SHASTA.

GOLD IN MILLVILLE.—*Record*, Feb. 19: Considerable excitement was created by the discovery of gold on Main street. Henry Thomas, an old miner, picked up a piece about the size of a double B shot, and several others picked up smaller pieces between Baker & Teel's store and Simpson's hotel. A pan was obtained, a portion of the earth washed, and a considerable quantity of gold was obtained. Mr. Thomas expresses the opinion that with plenty of water the drirt would pay well. No locations have yet been made.

TUOLUMNE.

JOE HOOKER.—*Independent*, Feb. 21: A tunnel is run 60 ft, cutting the vein 80 ft deep. A level has been run on the chute from this point, 115 ft. The ore yields $25 per ton. At the south chute the vein is 2½ ft wide. This chute extends 240 ft. The ore averages $22 per ton.

HAZEL DELL.—The shaft is down 85 ft on the pay chute, which is five ft wide. The level is in 100 ft. The ore outside of pay chute mills $45 per ton. The lowest grade ore taken from the mine gave $8 per ton. Highest grade from pay chute $150 per ton.

NEVADA.

WASHOE DISTRICT.

ORTHA.—Gold Hill *News*, Feb. 25: The ore body struck east of the stopes of the Hardy vein, 2100 level, continues to increase in interest, and is being opened up both north and south, and in both directions shows more favorably than where cut by the original crosscut. The drift north on the Hardy vein, 2200 level, is in 108 ft in vein material giving low assays. The south drift on the same level is in a vein formation, its face 110 ft from the main drift east.

CALIFORNIA.—From a point in the north lateral drift, 300 ft north of crosscut No. 1, 850 level, a crosscut has been started west to explore the vein. It will be known as crosscut No. 2. Crosscutting west on the 1500 level has a total length of 70 ft. Tho crosscut east on the 2100 level to find the ore vein encountered on the 2000 level, continues in streaks of ore giving fair assays.

UNION CON.—The projected winze, from a point in the east drift on the 2400 level, 324 ft from the Union shaft, will be sunk to the 2400 level. The main east drift from the Union shaft on this level has been connected with the southeast drift, and the southeast drift is being continued on through the same heavy vein formation heretofore noticed; total length, 110 ft.

MEXICAN.—The north drift, 2300 level, has made connection with that south from the foot of the joint Union winze from the 2000 level, and completed the thoroughfare for that level from the Ophir incline to the Union shaft. The joint Union crosscut, 2300 level, is now 75 ft in length.

BELCHER.—The chamber for the winze to be sunk from the 2760 level has been completed and the winze commenced. Some fine bunches of ore have been encountered in cutting out the chamber. The winze is in the same formation, although 25 ft east of the ore streak first encountered. Working south on the 3000 level to get under the same formation.

JUSTICE.—The main lateral drift south and east on the 1650 level has been extended 550 ft from the Alta line. The southwest drift on the same level is being run to get under the promising formation on the level above. Crosscut No. 2 west, same level, is cutting vein porphyry, streaked with quartz, giving low assays.

ALICE & BENTON.—Length of north drift, 400 ft; south drift, 390. Some excellent ore has been developed at this point.

SIERRA NEVADA.—East crosscut, 2300 level, is in 100 ft in vein porphyry. North drift, same level, in good vein material. North drift, 2400 level, in 314 ft in porphyry mixed with low-grade quartz. Winze from same level down 53 ft, the bottom in good ore.

YELLOW JACKET.—The crosscut west, 2700 level, from a point 254 ft south of the shaft, is in 35 ft. The north winze is down 188 ft on the slope, below the 2700 level, cutting seams of quartz.

UTAH.—The east crosscut on the 1750 level is in soft vein matter, 160 ft from the incline. The south lateral drift is in softer vein porphyry; total length, 100 ft. Tho incline is 236 ft on the slope below the 1750 level.

HALE & NORCROSS.—The winze from the 2200 level is down 157 ft. Crosscut west, 2200 level, is in 220 ft.

CHOLLAR.—Tho drift south towards Potosi ground on the 2400 lovel has a total length of 275 ft. The face of the drift is in a dry clay formation.

CROWN POINT.—The joint Belcher crosscut east on the 2700 level is in 142 ft. The winzo is down on the slope 80 ft below this level.

JULIA CON.—The south lateral drift, 2000 level, is in 115 ft. It is being run for the line of the winze. The winze from the 1800 level is down 275 ft on the slope.

ANDES.—Sinking a winze from the 350 level. It is down 20 ft. Drifting east on the same level from point 50 ft north of the winze. Drifting west on the 200 level.

CON. IMPERIAL.—The north drift for the joint Alpha winze and on the 2800 level has a total length of 28 ft. The winze is 235 ft on the slope, below the 2600 level.

BELMONT DISTRICT.

BELMONT.—*Courier*, Feb. 14: The crosscut running west from the 300 level is in hard blasting ground, and has cut several stringers of quartz which are rich in silver, and the vein between this and the 200 level, for a distance of 150 ft, both north and south of this crosscut, has been very productive. The main 300 drift cut through a vein two ft thick, eight inches of which shows fair ore.

SAN ANTONIO.—The 450 crosscut is in 68 ft. The face is in hard porphyritic slate, and the formation and character of the rock shows that it is below all breaks and surface movements, and that the ledge on this level will be between two well-defined walls, as it is already developed on the 350 level.

JETT CON.—The shaft of the Centennial ledge is down 40 ft. The bottom is in very fine ore, which improves in quantity and quality as the shaft gains depth, and gives prospects of being a strong and rich silver vein.

BARNELL.—The main incline on the Blue Bell lode has been sunk 45 ft. The first 20 ft were through a break, when the ledge was again struck showing high-grade ore, which has continued to the end of the incline. The second east level has struck the east ore body, showing high-grade ore. An upraise from this level of 20 ft shows ore of the same grade. The first west level, at a depth of 175 ft on the incline, has been run 15 ft and stoping commenced in high-grade ore.

BRISTOL DISTRICT.

BRISTOL.—Pioche *Record*, Feb. 21: This company is looking for a mill site, it being their intention to put up a mill and furnace immediately, and also to sink an artesian well in connection with the mill and furnace.

THORNDYKE.—A vein of ore was struck assays of which go as high as $2 and $3 a pound. From average samples of the whole vein assays range from $873 to $2,300 per ton. It has opened out to over three ft, with an average assay of the whole ledge of over $600. It is gaining strength as work goes down, and everything is favorable for the opening out of a large ledge.

EUREKA DISTRICT.

EUREKA CON.—*Sentinel*, Feb. 21: The following work has been done in the several different levels: 1st—Winze sunk 24 ft; in all 44 ft. 3d—Northwest drift 31 ft; now in 117 ft. 7th—Northeast drift run 30 ft; now in 130 ft. North drift, 15 ft; now in 106 ft. Upraise, 32 ft; now in 49 ft. 8th—Southeast drift run 10 ft; now in 127 ft. 9th—Drift from raise, 12 ft; total, 24 ft. 10th—East drift advanced 76 ft, and now in 122 ft. West of incline run 9 ft, and now in 23 ft. 11th—East of incline, 10 ft; total, 112 ft. North crosscut No. 8 advanced 8 ft; total, 64 ft.

ESMERALDA DISTRICT.

DEL MONTE.—*Herald*, Feb. 21: All work in the mine has been centered at the 420 station in excavating for and putting in the plunger pump. The excavation is finished and the pump is in place. The next thing to be done is the putting in of two pump rods, after which the pump

CONTINUED ON PAGE 140.

Kodiak Island.

The following very interesting paper on Kodiak island was read by Mr. W. J. Fisher at a recent meeting of California Academy of Sciences:

In April last, I took passage on the whaling bark, *Mt. Wollaston*, Capt. E. Nye, for the harbor of St. Paul, on Kodiak island. After a two months' cruise along the eastern shore of Alaska, between Mt. Edgecumbe at the entrance to Sitka barbor and Mt. St. Elias, and on the so-called Fairweather ground, during which we touched at "Ochek" or Middleton island; we arrived at St. Paul on the 12th of June.

Our cruise along the different islands bordering the eastern shore of Alaska was very delightful. All the lower ranges of mountains were covered with either grass or forests, while the higher peaks still retained their winter babiliments of snow.

Very often natives in their boats boarded the vessel, offering skins and the products of the chase for sugar, molasses, tobacco and bread. All these natives were "Koloshes," the most warlike and enterprising Indian tribe inhabiting these latitudes. They seemed to be good-natured and jovial, but were extremely sharp in trade. The custom to paint the forehead, nose and cheeks black, with some pigment found in their country, did not tend to improve their appearance. The women, besides being painted, had a hole bored through their under lip, in which they wear a sharp, pointed piece of silver, or other bright metal.

About 40 miles north of Cross or Icy straits I observed two extensive glaciers, coming down the Mount Fairweather range of mountains and extending to the ocean. In front of the largest, a point of land with a solitary tree on its extreme end, had been forced far into the ocean. Huge masses of floating ice were drifting in Icy straits, making navigation dangerous.

On June 6th we sighted Ochek or Middleton island. The island is about 16 miles in length and rises very abruptly from the ocean to a hight of from 130 to 180 feet. The top of the island seemed to form a platform broken by numerous low hillocks. It is without trees, but covered with grass. It also has several fresh-water lakes, and is a great resort for water fowl. Both the north and south points of the island are prolonged by extensive reefs upon which the sea breaks heavily. Except in very calm weather it is difficult and dangerous to effect a landing. On account of the great number of sunken rocks, vessels should never approach this island nearer than three miles.

The Island of Kodiak is situated between 56° and 58° north latitude and 152° and 154.42° longitude at its widest part, between Capes Greville on the eastern and Ikolik on its western side. It is deeply intersected by innumerable bogs and inlets, and bordered, especially on its eastern and northern sides, by a great number of islands and small islets.

Shelikoff straits, about 50 miles wide, divides it from the main land of Alaska on its northern side. It has a great number of small rivers, the largest and most important of which, the Karluk river, empties into Shelikoff straits.

When I arrived at St. Paul the snow had all disappeared except on the highest mountain ranges. The lower hills and the valleys were covered with grass already several inches high, and interspersed with numerous brilliantly colored flowers.

The mean temperature of air during the month of July was 52°; for August, 55°; September, 49°; October, 39°. The warmest days in the above months were—

July 4, at 6 A. M.,	56°;	12 M., 64°;	6 P. M., 57°
Aug. 24, "	66°;	" 74°;	" 59°
Sept. 12, "	52°;	" 53°;	" 53°
Oct. 12, "	44°;	" 56°;	" 46°

During July we had clear days, 10; August, 22; September, 14; October, 24. In rainy weather the prevailing winds are most invariably easterly. I was informed that the past summer had been an extremely cold one.

At all the settlements on this island, especially on the adjacent Island of Atognak, potatoes of very fine flavor and good size are raised; turnips also grow well and of good size; radishes and lettuce thrive well; cabbages are a failure. Grass of excellent quality grows luxuriantly, attaining a hight of two to three feet. In August it is cut, dries very quickly, and stored for winter feeding. Cattle grow fat on it, and their meat is very tender and of fine flavor. When I left Kodiak in November, cattle were still at large.

Last summer being unusually cold, the generally abundant crop of blueberries, cranberries and malinas, the latter a species of blackberry of red color, failed to some extent. The natives gather large quantities of these berries for winter consumption, also the root of a liliaceous plant, *Frittillaria kamtchatensis*, which is used in place of potatoes.

There are no sheep kept on the isle, although I think they would thrive well here. Hogs are not kept, as they will feed upon the beaches on shell and other fish, and their meat becomes fishy and unpalatable in consequence. Chickens are plentiful, but their eggs are invariably of extremely small size.

The bays and inlets abound in halibut, codfish, herring and several varieties of salmon; the lakes and brooks are filled with delicious trout. The natives dry large quantities of codfish and salmon during the summer for their winter supply; and also collect large quantities of salmon spawn for the same purpose. During the summer a species of salmon of very large size is caught in the Kenay river, Cook's inlet. One minus the head and entrails, brought to St. Paul, weighed 91 pounds, and measured over 6 feet in length. This species is called by the natives, the king salmon, and is undoubtedly deserving this name. They are extremely fat and far superior as food to all other kinds. Codfish are caught close to the settlement, and in a day's fishing it is not unusual to catch from 200 to 300.

The numerous seal rookeries furnish also abundant food and oil. Occasionally a whale is captured. Then the whole settlement has a feast, whale blubber, no matter if rather strong in flavor and small, being accounted a delicacy.

The fur-bearing animals are but sparsely represented on this isle. Except the Alaska or cinnamon bear, still found in large numbers in the interior, all the other and most valuable fur-bearing animals are nearly exterminated.

In the lower portions of the island extensive forests of spruce exist, the trees do not attain a large size, however. On the adjacent spruce and woody islands, trees of large dimensions are common. The trees are very knotty and therefore not very serviceable for building purposes.

The harbor and settlement of St. Paul is situated in 57.47° latitude and 152.22° longitude, on the southeastern side of Kodiak island. Directly opposite the harbor is Blisky or Near island, the straits between, about 400 yards wide, forming the harbor. The village contains about 125 one-story dwelling houses, one church (Greek), stores and warehouses of the Alaska Commercial Company and Western Fur & Trading Company, and soldier's barracks, officers' quarters and store-houses, erected for and occupied by regular troops some years ago. The latter are, without exception, in a dilapidated condition, and in a few years hence will be uninhabitable. The village is irregularly built, and the streets need grading, etc. While the U. S. troops were garrisoned here, the streets were kept in good order and repaired when required. Bridges crossing the numerous small rivulets meandering through the settlement were built; culverts to drain off the surplus water from the lakes and marshes were constructed. But since the withdrawal of the troops nobody has taken the trouble to attend to necessary repairs, and as a consequence the streets are, with few exceptions, turned into gullies; culverts and dams have been washed out by freshets, and portions of the planking of the bridges have rotted away, and some of it has been used for firewood by the natives, making it dangerous to walk out in dark evenings.

The inhabitants, numbering not more than 500, are mostly Creoles. There are but few pure Aleuts residing here, and of the settlement of Koloshes (during the Russian regime brought over here from Sitka, and at that time numbering some 60 to 70 souls) only three families are now remaining. About 40 years ago a number of Creole families settled on Russian river in this State, returned to Kodiak island and settled at St. Paul.

The general health of the inhabitants is good. The most prevalent sickness among them is consumption. Their principal food consists of fish, either fresh or dried. The natives are all members of the Greek Catholic church, which is supported by the Russian government. But very few of them speak the English language, the current language being either bad Russian or Aleut. There is no doubt that the native population, as well on this island as on the main land, is gradually dying out.

The houses are all built of logs, smoothly hewn on the inner side, and the crevices filled in with moss. They are all of one story, and the rooms are kept nice, clean, and comfortable, in almost every instance. Only a very few of the former underground dwelling houses are now used. The stoves are built of brick with a number of flues running through them, are placed in the center of the house, and so constructed that each side forms part of a room. After being once thoroughly heated they will retain the heat for a long time, requiring only a small additional supply of fuel each day, and throw out sufficient heat to warm the whole house. For fuel the neighboring forests of spruce furnish a ready supply. This wood, although very knotty, is used in the construction of their houses; boats and even sloops from 5 to 15 tons burthen have been constructed therefrom.

A few of the natives are skilled mechanics, as carpenters, blacksmiths, bricklayers, etc. The present blacksmith at St. Paul does also attend to the repairing of watches and manufacturing jewelry. Wages are 50 cents and food per day for common labor. There is no regular physician at the village or on the island; a former hospital steward of the Russian American company attends to the physical well-being of the inhabitants. The vacancy occasioned by the death of the clergyman in March last has not as yet been filled, and the two deacons of the Greek church look after the spiritual wants of the natives.

The people are naturally peaceable, and but seldom serious disputes occur among them, which are always quickly and satisfactorily settled by appeal to the agents of the trading companies or the resident clergyman, so that the want of lawyers has never been felt. No land claims need adjusting. Everybody is at liberty to take possession of any unoccupied land, and there is no tax collector to collect taxes of any kind. There is no drugstore on the island. The Alaska Commercial Company keep a large stock of medicines at their several agencies, and distribute the same gratuitously to the sick and suffering without exception.

Comparatively few of the men of this settlement employ their time in trapping and hunting during the winter, the majority remaining at home in indolence.

There are a half dozen places in the village where whisky is made; a couple of kerosene tins and an old gunbarrel, and all the implements required to set up a still for the manufacture of this article, which is always in great demand and meets with a quick sale to both males and females. The marriage laws are not generally strictly adhered to; this is to some extent owing to the absence of a clergyman to perform the ceremony. There are no public schools; some of the children attend private schools. The Sabbath commences here at 6 P. M on Saturday, ending at the same time on Sunday. Divine service is held on Saturday eve and Sunday forenoon; it is well attended, principally by the female portion of the community.

In addition to the regular Sundays there is hardly a week without its additional holiday or saint's day, on which all labor is suspended and divine service held. The females, in addition to their regular household affairs, attend exclusively to the cultivation of their potatoes and garden patches, to gathering stores of berries for winter supplies, and to the curing and drying of fish; while the men devote their time to hunting and fishing, occasionally doing odd jobs of labor, when an opportunity occurs and they feel inclined to work, which but seldom happens. Parties engaged in curing codfish last summer found it difficult to engage natives to catch the fish, although as high as $2 per 100 was offered.

The several fur companies furnish not alone the hunting parties, but also their families, during their absence, with food, etc., to be paid for out of their prospective catch of furs. If the parties are unsuccessful, which often occurs, the respective companies have to bear the loss; if successful, the catch is brought to the store and paid for in coin only, and not in goods. There being three stores here at present, the natives enjoy perfect liberty to trade at which-ever store they prefer.

This island, as well as the whole Territory of Alaska, offers a large field in nearly every branch of Natural History, to the naturalist and collector. Before the cession of the Territory to the United States, Russian naturalists worked up its fauna to a large extent, but yet it is far from being exhausted. Through the liberality of the Alaska Commercial Company, who have instructed all their agents, stationed over a large portion of Alaska, to gather all specimens of Natural History, and to collect all data and items bearing upon the ethnology, geology, geography, mineralogy, zoology and climatology of their respective districts, we have gained a vast amount of information of this heretofore almost unknown portion of our country; and our own Academy, and principally the National Museum at Washington have been the recipients from this company of often repeated and valuable donations of specimens of Natural History pertaining to Alaska Territory.

There seem to be no doubt that the fur-bearing animals are gradually diminishing in numbers, and that, owing to the reckless violation of the laws made for the protection of this, one of the most valuable productions of the Territory, the time is not far distant which will see them utterly extinct, and it invites our serious attention to devise the means to prevent this result.

If our Government could be induced to divide the Territory into districts, lease each of them to a responsible party or parties for at least 20 to 25 years, at a yearly rental to be paid by the highest bidder, the Government would derive a certain yearly revenue, and it would be for the interest of the lessees to take measures to prevent the extermination of the fur-bearing animals.

1st. By stocking some of the numerous islands along the coast with some of the most valuable fur-bearing animals.

2d. By enforcing a strict compliance with the laws now in force, but always broken, prohibiting the killing of fur-bearing animals at certain seasons of the year.

3d. By the establishment of public schools, etc., to elevate the natives to a higher standard of civilization and a life of sobriety and industry.

In conclusion, I wish to express my sincere thanks to the Alaska Commercial Co. and their agent at Kodiak, for the kind assistance rendered me at all times in the prosecution of my labors while at St. Paul, Kodiak.

A Large Lake Dried Up.—Where at one time, says the Eureka *Leader*, was Ruby lake there is at present not a drop of water. This sheet of water, seven or eight years ago, was from 18 to 20 miles in length, and varied in breadth from half a mile to two or three miles, and was in a number of places very deep. It was fed by numberless springs along the foot of Ruby mountain, and was the largest body of water in eastern Nevada. For a number of years past it has been gradually drying up, until at last it has entirely disappeared. What has been the cause of this is a mystery. The Ruby range of mountains is considered the largest and finest between the Rockies and the Sierra Nevadas, and besides being well wooded, has been the best watered range of mountains in Nevada.

Town Sites and Mines.

An action, entitled "Town site of Silver Cliff *vs.* The State of Colorado," was commenced, to decide the legality of the town site, and thereby debar individual claimants from occupancy and possession of mineral locations within its limits.

The application to make such entry by the commissioners appointed for that purpose by the Board of Trustees of the town, was refused on the ground that the land involved was a school section and inured to the State of Colorado under its grant of sections 16 and 36, for school purposes.

The declaration of the town was filed, and a hearing was had to determine if said section 16 was known as mineral land prior to survey. It was shown beyond doubt that the land was known as such as early as 1864. The following are the salient points in the case:

1. The provision in the act of February 28, 1861, providing for a temporary form of government for the Territory of Colorado, respecting sections 16 and 36 in each township, was a reservation—not a grant; and those sections remained the property of the United States until granted by act of March 3, 1875, providing for the admission of Colorado into the Union.

2. By the proviso to the said act of March 3, 1875, all mineral lands were excepted from its operation; and any of said sections 16 and 36 known to contain minerals prior to the admission of the said State are excepted from the grant.

3. The grant as to such sections surveyed *subsequent* to the admission of the State, took effect upon the approval of the survey by the Surveyor-General.

The State claimed section 16 under the plea that when the lands were surveyed the surveyor did not class them as mineral lands. The following is the decision as rendered:

In the present case it is immaterial whether the land was known as mineral prior to survey or subsequent thereto, provided it was so known prior to the admission of the State into the Union, for at that date, and not sooner, said grant took effect as to non-mineral lands in said sections, which had then been surveyed.

The grant, as to such sections surveyed *subsequent* to the admission of the State, took effect at date of the approval of the survey by the United States Surveyor-General.

In the case now under consideration, the land was known to be mineral prior to both survey and admission of the State, and it is immaterial that the surveyor did not discover its true character.

It is also immaterial that said land was not worked and developed for its mineral until a recent period; for said act of March 3, 1875, does not provide that land which is worked for minerals shall be excepted from the grant, but "all mineral lands," whether worked or not.

The land in question is clearly not within the grant to Colorado for school purposes, but is government land, and subject to sale only under her laws.

The claim of the State is accordingly rejected. You will give due notice hereof to all parties in interest, allow sixty days for appeal, and thereafter promptly report action to this office.

Protests from claimants to mines within the town limits, against granting a patent to said town, which does not except there from specifically all surface ground embraced in such claims, and alleging location prior to town occupation, have been received at this office. Should the town make entry and patent issue thereon, it will contain only the following exception: "*Provided*, that no title shall be hereby acquired to any mine of gold, silver, cinnabar or copper, or to any valid mining claim or possession, held under existing laws: and *provided further*, that the grant hereby made is held and declared in subject to all the conditions, limitations and restrictions contained in section 2386 of the Revised Statutes of the United States, so far as the same are applicable thereto."

In case of the town site of Central City, Colorado, decided by this office December 23, 1875, and decision affirmed by the Hon. Secretary of the Interior, June 7, 1876, it was held that town-site entry could be made of land overlying lodes or veins, and that patent should issue for such town site, with said reservation only. Since the date of said decision this rule and practice has uniformly and without exception been followed, and under it the owner of a mining claim is secured in all those rights intended in he granted by the law.

You will notify the State that, should it file a written waiver of appeal from this decision, the case will be closed, and the town authorities permitted without further delay to proceed with their application for patent.

Very respectfully,

J. M. Armstrong, *Acting Commissioner.*

[A waiver of appeal was filed.]

Magnetic Influence of Atmospheric Polarization.—Henri Becquerel infers, from recent observations upon skylight polarization, the existence of a variable difference between the solar plane and the plane of polarization and the manifestation of a magnetic influence by the earth upon the atmosphere.—*Comptes Rendus.*

The Merchants' Telephone Exchange of New York City has 650 telephone lines constructed, the total length of which is 600 miles. It is the intention to connect the Exchange with the Central Telephone office in Philadelphia.

The Engineer.

Defective Flues.—The defective flue is having its day. In a late London *Architect* a list of burned churches is given, in which bad flues are stated as the cause in a number of cases. One of the Harvard College buildings was considerably scorched December 15th by fire from a defective flue, and we shall expect to hear of similar cases continually through the cold season. Here should be a lesson to architects to take greater care in this important detail of building. Mr. P. B. Wight in his address on "Fire-Proof Construction," before the New York State Association of Supervising and Adjusting Agents, said: "As a rule, the brickwork should not be diminished by the introduction of flues, but an amount equal to that displaced should be disposed on each side of a flue. By this means a buttress may be obtained. I adopted this rule while building in Chicago after the great fire, and in one of my buildings which was burned the importance of it was demonstrated, for in this case the walls of a six-story warehouse, with brick cornice, remained intact after the whole interior had burned out." —*Sanitary Engineer.*

A New Elevated Railroad.—Mr. Charles Leavitt is exhibiting in Cleveland, Ohio, working models of an invention which promises to do away with many of the objections urged against elevated railways. It is described as dispensing with the inconvenience of tracks in streets by substituting an elevated truss-work sustaining a single or double track, as may be desired, the cars being suspended under the track and coming to within about a foot of the pavement. The trucks travel upon the elevated track with an easy, smooth and almost noiseless motion, and are so secured that they cannot be forced from the rails. The appliance for propelling the cars consists of an endless steel wire cable, which extends the entire length of the road above the track and runs in a circle, so that cars upon one track are drawn in one direction, those upon the other in the opposite direction. The motor is a stationary steam engine, situated at one end of the road, which works directly upon the cable. The cable is attached to or detached from the trucks of the car by a clamp device, which admits of starting or stopping the car at any point.

Engineering Notes.—Of the present state of work at the St. Gothard tunnel, it is reported that a serious obstacle has lately been encountered in some soft strata, the enormous pressure of which has, up to the present, resisted all attempts at successful penetration. The most solid beams are bent after a little time, and a resistance wall of one meter thickness was completely crushed. Another of two meters thickness is now constructing. In these strata, the boring machine is useless, and only hand-labor can be employed. A bill has been introduced into the National House of Representatives for the creation of a permanently deep, wide and straight channel through Sandy Hook bar to the port of New York. On the 8th of December, preliminary work for the driving of the Mersey tunnel was commenced. The engineers will drive trial headings both from the Liverpool and Cheshire sides of the river, to determine the nature of the strata to be encountered before beginning the main railway tunnel.

The Hudson River.—As originally proposed, the Hudson River tunnel would have been a simple bore, large enough to accommodate two railway tracks. Lately the company have changed their plan, we are informed, and there will be two small bores instead of one large one. These will be bored throughout with three-eighth-inch iron plates. One reason for the change is that small tunnels will be stronger than a large one. The tunnels will meet and overlap about a foot. When they meet, the brickwork will form a partition and hold up the structure so that it will sustain a greater pressure from above and from the sides. It is believed that the workmen can proceed faster than by the old method, and that the work can be sooner completed than was at first anticipated.

The Tay Bridge.—A prominent civil engineer in London, E. W. Ives, has submitted to his professional brethren, at their request, a report on the Tay bridge disaster. Mr. Ives expresses the opinion that the whole bridge was of far too light and flimsy a character, especially the piers, which also he considers to have been badly designed to resist the under pressure to which they were subject. He believes that everything was sacrificed to cheapness and facility of construction, and that, in fact, the outlay was pared down to the lowest possible point.

Improving the Seine.—The *Journal des Debats* describes a plan about to be carried into effect for deepening the Seine, by which vessels drawing nine feet of water will be enable to reach the eastern extremity of Paris. The works will cost about $9,000,000.

Iron Railway Sleepers in Belgium.—It has been decided to use iron sleepers in future on the Belgian railways. The Cockerill Iron Works has accepted a contract for 300,000, and other contracts have been and are going to be distributed among the firms of La Louviere and Charleroi.

Useful Information.

Curiosities of the Locomotive.—Our first-class narrow-gauge engines weigh, empty, 44,000 pounds, and are worth 16 cents per pound. They will consume one cord of wood and 1,200 gallons of water per hour, and will generate 275,000 cubic feet of steam per hour, of a pressure equal to that of the atmosphere. Their heating surface is of the extent of the bottom of a boiler 34 feet in diameter. The strain upon the iron of the shell of boiler, to burst it open lengthwise of the boiler, is from 6,500 to 11,500 pounds per square inch under ordinary pressures. There is also an additional strain of about 4,000 pounds per square inch exerted lengthwise of the boiler to pull it apart crosswise. The whole pressuree exorted against all the internal surfaces of the boiler amount to 20,000,000 of pounds or 10,000 tons! The crown sheet of furnace, alone, carries a load of 120 tons! The usual distance traveled by the locomotive, being in motion but about one-eighth of the time, is equal to once around the globe every year. In going 60 miles an hour, 88 feet are traversed per second, five revolutions of the driving wheels are made, requiring 20 strokes of the piston, and 20 intermediate periods of action of the valve, equal to the division of a second into 40 parts.

Preserving Wood with Lime.—The improved French method of preserving wood by the application of lime is found to work well. The plan is to pile the planks in a tank, and to put over all a layer of quicklime, which is gradually slacked with water. Timber for mines requires about a week to be thoroughly impregnated, and other wood more or less time, according to the thickness. The material acquires remarkable consistence and hardness, it is stated, on being subjected to this simple process, and the assertion is made that it will never rot. Beech wood prepared in this way for hammers and other tools for ironwork is found to acquire the hardness of oak, without parting with any of its well-known elasticity or toughness, and it also lasts longer. It is said that the adhesiveness and durability of a solution of 100 parts of gum arabic in 250 parts of water may be greatly increased by adding two parts of sulphate of ammonia.

A Load for a Man.—Some interesting results have just been published of experiments made in France, in regard to this question, which are practically new. The maximum load for a moderate distance was found to be 319 pounds; but for a long distance, say a soldier marching on level ground, he could not carry more than 132 pounds, distributed over the body as knapsack, cartridge-box, musket, etc. If he carries this seven or eight miles for a day, it is equivalent to a good day's work. This is equivalent to 1,518 pounds carried a distance of 3,200 feet for a day's work. But if he ascends a ladder, like a hod-carrier, he can only carry 120 pounds continually, and will in a day carry only 1,230 pounds 3,200 feet high.

Malleable Bronze.—According to a recent German patent, taken out by M. Dronier, malleable bronze may be obtained by the addition of a small quantity—from one-half to two per cent.—of mercury. The action of the mercury seems to be rather mechanical than chemical, and it is not necessary that the mercury he mixed with the composition of the alloy. It may be added to either of the metals of which the alloy is to consist (being poured into the fused metal and stirred with it); or it can be introduced along with the tin, or soon after it, into the copper bath. Especially good results are obtained if a warm mixture of tin, with one to two per cent. of mercury, be formed and added to the melted copper.

Steel and Iron.—The total amount of steel and iron produced annually in the world, according to the report of Commissioner Morrell, to the Paris exposition is, of iron, 13,807,725 tons, and of steel, 2,770,524 tons. Of the iron, 43.63% was produced by Great Britian, 16.67% by the United States, 13.16% by Germany, 10.26% by France, 4% by Belgium, Austria and Hungary each furnish about 3%, and all other countries 4%. Steel is produced by England, about 40% of the whole, the United States furnishes 20½%, Germany 13½%, France 10%, and 7½% by all other countries.

To Keep Steel from Rusting.—To keep nice steel work bright and free from rust, after it has been filed and burnished: Dissolve 10 parts clear grains of mastic, 5 parts camphor, 15 grains sandarac and 5 parts elemi, in a sufficient quantity of alcohol, and apply the varnish without heat. The articles treated with this varnish will not only be preserved from rust, but their metallic luster will not be in the least dimmed by exposure to dampness.

Strength of Human Pull.—In regard to the effect and the velocity with which a man can produce by pulling or pushing with his arms, it has been found by some experiments that, under the most favorable circumstances, and for continuous work, an effect cannot be gained exceeding from 26.4 to 33 pounds raised from 1.8 to 1.2 feet per second, which is equivalent to about 4,000 foot-pounds raised one foot, or 4,000 foot-pounds, or one-eighth of a horse power.

To Remove Rust from Steel.—Steel which has rusted can be cleaned by brushing with a paste composed of ½ ounce cyanide potassium, ½ ounce castile soap, 1 ounce whiting, and water sufficient to form a paste. The steel should first be washed with a solution of ½ ounce cyanide potassium in 2 ounces water. To preserve steel rails from rusting, a good method is to paint them with melted caoutchouc, to which some oil has been added. The caoutchouc must be melted in a close vessel to prevent its burning, and should be frequently stirred. It is also said that dipping the steel in a solution of common soda (about 1 in 4) will preserve it from rusting.

Buried Oak Timber.—In deepening a river in the neighborhood of Norrkoping, says the *Timber Trades Journal*, in order to make it accessible for ships of heavier draft, among several objects of interest brought up from the bottom, eight oak trees were found at a depth of seven feet under the old bottom. The bark was almost decayed, and when it was taken off, the wood was found to be hard and black, resembling ebony. The trees are supposed to have been lying in the earth 900 years. The trees have been sold to a firm of joiners, who intend using them for cabinet work.

The Metric System.—It may not be generally known that we have, in the nickel five-cent piece of our coinage, a key to the tables of linear measures and of weights. The diameter of this coin is two *centimeters*, and its weight is five *grammes*. Five of them placed in a row will, of course, give the length of the *decimeter;* and two of them will weigh a *decagramme*. As the *kiloliter* is a *cubic meter*, the key to the measure of length is also the key to measuree of capacity. Any person, therefore, who is fortunate enough to own a five-cent nickle, may carry in his pocket the entire metric system of weights and measures.

A Hard Composition.—Melt together over a gentle fire in an iron pot: Pitch, one part; gutta-percha, two parts; orange shellac, five parts; add to this six parts of white lead (lead carbonate) in impalpable powder, and stir until a perfectly homogeneous mixture is obtained, and you will have a composition hard enough to make pool bells, which may be cast and colored with analine dyes mixed with dilute alcholic solution of bleached shellac.

To Case-Harden Cast Iron.—In three gallons of clean water mix one-half pint of oil of vitriol and two ounces of saltpeter. Heat the iron to a cherry-red and dip as usual.

Good Health.

Clothing in its Relation to Health.

Approximately, the human body when clothed resembles a steam jacketed pipe; the clothing forms the outer covering, between which and the body there is a layer of steam and heat, and which are constantly ascending. The place where this current of hot air and steam passes out into the atmosphere is the narrow ring between the neck and the shirt collar. This opening plays, therefore, an important part in the maintenance of the temperature of the human body. If it is enlarged, the heat and steam escape more quickly, and the skin is soon cooled; if, on the contrary, it is wholly or partially closed, by being closely buttoned or by a muffler, then the loss of heat is stopped, and the temperature of the skin raised. Thus there is nothing more injudicious than the constant wearing of a muffler or the thick neckerchief of our forefathers, because it impedes the evaporation of the matter which ought to pass out of the skin; though, for the same reason, it is of great value in case of cold.

While the dampness of the atmosphere affects the evaporation through the lungs as well as the skin, clothing, by night as well as by day, regulates that of the latter. All covering which impedes this evaporation, acts injuriously. Though no material is quite faultless in this respect, there is still a great difference in their structure. The less they are impervious, the more they are to be avoided. India rubber stands at the bottom of the list, for it does not admit of the passage of any water; leather comes next; less objectionable, but still repellant, is linen, as an instance of which we may mention the blue linen blouses worn by the Belgians and Dutch over their other garments as a kind of waterproof. Cotton has a great advantage over the foregoing, as it is to a certain extent porous; but the best of all percolators is a woolen material. A flannel shirt is more healthy than a cotton one; a woolen blanket at night than a linen sheet.

The action of the skin depends also upon the circulation of the blood under its surface, and the latter is promoted by outward friction. A material which induces the latter is therefore also more healthy, and rougher underclothing, such as woolen or coarse cotton, are preferable to the enervating finer linen or silk.

Another point to be observed is the keeping of the skin warm, because warmth keeps the pores open, while cold contracts and closes them; and here again woolen clothing stands first.

Thus it is proved that in point of porousness, friction and warmth, woolen clothing is to be preferred to all others.

But not only the material of the clothing is of importance, but also its cut. In warm climates, where clothing is more a luxury than a necessity, the loosest garments are the best; but in those latitudes where a certain amount of warmth has to be obtained by clothing, the garments must be worn more closely fitting. We have before likened the human body to a steam jacketed pipe, where this steam is constantly in an ascendant motion; the faster this circuletion takes place, the more is the skin cooled; it follows, therefore, that the most regular and constant evaporation is maintained by closely-fitting garments, and the soldier's uniform is therefore the healthiest of all.

We need not here enlarge upon the very extended use of flannel underclothing, especially as shirts, which has come in vogue since cotton clothing rose to such exorbitant prices during the American war, and which, once appreciated, has not been abandoned since. This has also led to the production of a great many textile fabrics containing more or less wool mixed with cotton or other fibers, in order to counteract the shrinkage of the latter and make the fabrice more adapted for washing, one of the products being the vigogne yarn, to which we have lately drawn attention.—*Textile Manufacturer.*

Effect of Plants on the Health.—The popular belief that plants kept in the house are injurious to the inmates, is purely fanciful. Under the influence of sunlight the leaves of plants absorb carbonic acid from the atmosphere and decompose it, yielding back the life-supporting oxygen, from which the inference might be justified that they were rather wholesome than otherwise. On the other hand, it has been shown that when the influence of light is withdrawn, this action of the plant is temporarily suspended—the plant sleeps, and the excess of carbonic acid gas taken up during the day is given off at night; and because of this action, the presence of plants in sleeping apartments has been thought to be unwholesome or injurious. The bad effects to be attributed to plants from this cause are too trifling to be worth serious consideration. The inhabiting of sitting and sleeping apartments warmed by baked air drawn from foul cellars, the neglect of means to secure proper ventilation, especially in sleeping apartments, and the poisoning of the atmosphere of dwelling houses by the entrance of sewer gases through leaky traps, are very real and common dangers, compared to which the one alluded to sinks into utter insignificance, if indeed it be worthy to be considered at all.—*Manufacturer and Builder.*

Starving out Cancers.—At a late meeting of the Leeds (England) Medical and Chirurgical Society, Mr. J. W. Teale read a case of quiescent scirrhus. The patient was an unmarried lady of 35. A cancer formed in her breast, causing retraction, and ultimately the loss of the nipple; it ulcerated; some axillary glands enlarged, and the patient seemed about to die. But, in consequence, as it seemed, of the small quantity of food taken by the patient, the cancer was "starved." It atrophied slowly; and now, nine years after its first appearance, there was nothing but a hard cicatrix left in the breast and axilla. Cases more or less similar were related in the discussion which followed. —*Med. and Surg. Reporter.*

Arrowroot for Infants.—Dr. Routh says, in his Infant-feeding and its Influence on Life: "I cannot conceive of anything more injurious than arrowroot feeding. I believe that it is a cause of death of many infants." Dr. Davis says, in the *Virginia Medical Monthly*, that there is perhaps no error more common than that of administering to the infant arrowroot, corn starch, tapioca, or other starch foode. Not till after dentition is *diastase* secreted by the salivary glands, and starch food remains in the stomach and intestines non assimilable as a foreign substance, only disposed to irritate the delicate membranes.—*Louisville Med. News.*

Important Advice.—Beware of salves, beware of plasters, beware of eye-waters, beware of hair-dyes, beware of washes refining the skin, beware of toilet powders, and be careful in the use of scented soaps. Why? Salves make and keep the skin sore, plasters prevent wounds from healing, eye-waters do often more injury than good, most hair-dyes produce sore eyes, beautifying washes are often poisonous, ditto toilet powders, while scented soaps are usually too sharp by the free alkali they contain.

Chops and Steaks for the Sick.—In cooking steaks for the sick, they should always be cut about one inch in thickness. Beat it well with a rolling pin. This renders it tender and preserves the juice. Place upon a broiler and cook for seven or ten minutes, turning frequently. When done lay it upon a hot plate and season with salt and pepper and a little butter. Never chop meat with a sharp instrument. It severs the fibers, thus allowing the juice to escape while cooking.

Treatment of Simple Hiccough.—Dr. Grellety once saw a mother, tender and full of affection for her children, give them a morsel of sugar dipped in table vinegar whenever immoderate or too rapid repletion of the stomach or any other cause had induced hiccough. The latter ceased, as if by magic. Since then the Vichy physician has very frequently employed this means on his own account, and has never found it without avail.—*The Pharmacist and Chemist.*

The Week.

The weatber still remains unsettled, though tbe raine which have fallen have produced a good effect upon the growing crops, and have made certain a plentitude of grain for the ensuing harvest. The season has now so far advanced that we must be soon favored with clear ekies and genial sunshine.

In our mining sections there is a marked activity, not particularly in speculative movements, but in legitimate transactions. The output of bullion is continuous, and in some districts the yield is very favorable. New discoveries are being made of rich locations in Utah, Colorado and Arizona, and many of the mines are sending large quantities of treasure to their owners. By a reference to our "Bullion Shipments," in another column, a gratifying corroboration of this statement can be seen.

Our legislators, both in National and State councils, are modifying some of the existing mining laws, but it is to be hoped that they will not make as many changes as are talked of in connection with general business matters. In fact we have too much legislation and too many changes in laws. We hope that the mining laws will escape this general action, and that only those changes found absolutely necessary will be made.

THE annual meeting of the stockholders of the Murchie Mining Co. was held on the 17th, when the following named gentlemen were elected as Directors: A. Snider, E. T. Barber, A. V. Kautz, W. S. Schuyler, Jacob Naffziger, A. N. Shillingford, Joseph May, G. E. Bsunison, G. G. Francis, R. L. Tracey and S. D. Rogers. The following officers were elected: President, A. Snider; Vice-President, G. E. Bsnnison; Secretary, S. D. Rogers; Treasurer, Bank of California; Superintendent, W. S. Schuyler. The bullion yield of the mine for the fiscal year was $124,420, all gold, of which $67,026 was from sulphurets.

The Coming Prosperity of Mining.

For some years past there has been a lull in the development of mines in California. This was produced through the agency of various causes. The general depression which pervaded the business and financial circles of the nation was one of them. During its existence but few enterprises were inaugurated. Capital shrank from investment. Among our own citizens there was not capital enough, even if they had been willing to employ what they did possess, to fully open up all the mining properties which discoverers were endeavoring to bring into notice. Outside capital could not be obtained because the stringency was more sensibly experienced in other portions of the Union than here.

Restrictive legislative enactments; change in the basic laws of the State creating doubt and uncertainty as to their future operation and effect upon mining adventures; a partisan attack upon the rights of property holders; and violent threats against capital by discontented labor, all aided still further to check the prosecution of mining industries and added to the general stagnation in this field of enterprise.

But with an increasing prosperity, and a restoration of confidence, combined with the unprecedented influx of gold from foreign nations, an incentive was produced which has led to a recognition of the advantages of well-conducted mining. This in turn has been still further fostered by the rich yield of the mines that have been worked during the interval of quietude.

There were many mines in which the work was continued, but with a more decided care as to the economy and necessity of expenditure. Under this cautious management the income was in excess of the cost. There were many mines in which the work did not cease, but which for the time paid no profits, because a great amount of dead work was being done in them to enable them to give out their treasures when it should have been accomplished. This latter class, being now fully opened and equipped, are sending out their rich returns of valuable ore.

The merchant has to build and stock his store before he can begin to realize a profit upon his capital. So mines must be fully and completely opened before they can be made permanently productive.

With the expenditure of the past labor, and the consequent increase of yield, such alluring inducements are held out for the employment of capital in the still further advance of mining operations, that the subject has assumed almost the phase of an universal mania. Capital rushes forward to participate in the prospective profits of mining from which, but a comparatively brief time since, it shrank with nervous timidity. The result of this course is manifesting itself in the renewed energy which is displayed not only in our own State, but in every State where mines exist. From Maine to Georgia, from the Atlantic to the Pacific, the mines are yielding such treasures as they have never done before. Money is forthcoming from the coffers, where it has so long lain in idleness; it is withdrawn from other branches of industry where the profits are not so promising and placed, without reluctance, in the exploration of veins and placers.

The result of all this labor and employed capital in this wide field will be a continually increasing output of mineral wealth. The prosperity of the nation will be vastly increased; individuals will amass princely fortunes, and thousands of sturdy workers will find remunerative employment. An impetus will be given to all branches of trade and labor, which will be permanent and enduring, because it will be based upon and supported by solid wealth. It will not be fostered by a speculative advance in nominal value, which, in reality, is but a myth, a delusion and a snare, but it will receive its vitality from the positive creation of material wealth. Upon this basis it will stand firm and strong, and cannot be overthrown.

It needs no prophetic power to foretell the advent of better and more prosperous times, from the incentive given to and the profits arising from the working of the mines.

SKAGIT MINES.—We hear from a gentleman who has recently returned from Puget Sound that it is highly probable the reports concerning the Skagit mines are exaggerated. He was informed by miners from there that it was from 10 to 20 feet to bed-rock, and the many boulders were very troublesome. There may be a good deal of gold, but it is very hard to get out. Mining there has been carried on for a number of years, but until now there has been no special excitement. Our informant thinks the Seattle people like to have this excitement fostered, thinking it will benefit their town. He says the mines are not considered a very "big thing" by those who have been there.

HOLDERS of quicksilver are generally asking 45 cents per pound, under decreased production, and in consequence of the laws forbidding corporations to employ Chinese.

THE passenger list of the Pacific Mail steamers and the Overland railroad has heavily increased since the reduction of fare.

A State Mining Bureau.

Assemblymen Joseph Wasson, of Mono, deserves the thanks of the mining community for endeavoring to call the attention of the members of the Legislature to the fact that there are mines in this State, and that the mining interests which produce to California twenty millions of dollars a year, are worthy of consideration. Mr. Wasson has a pretty hard job to make the other members believe there is anything else connected with mining but certificates of stock, and as mention of stocks to most of the members is as a red rag to a bull, Mr. Wasson's efforts are praiseworthy, to say the least. Mr. Wasson is, we are pleased to say, a journalist, and an intelligent one; and he is also a miner and knows the importance of the mining interests. He has introduced several bills during the session relative to mining matters; two of which we print in this issue. In fact he is the only member of either house, so far as we recollect, who seems to have any intelligent idea of mining matters, or who cares to assist in building up the industry. Most of the others seem to want to break it down. He recognizes the fact that at present there is no official source from which information concerning our mines may be obtained by miners, prospectors or intending investors, and has, therefore, introduced the following bill to provide for the establishment and maintenance of a Mining Bureau:

SECTION 1. There shall be and is hereby established in this State a mining bureau, the principal office of which shall be maintained in the city of San Francisco, at which place there shall be collected by the State Mineralogist, and preserved for study and reference, specimens of all the geological and mineralogical substances, including mineral waters, found in this State, especially those possessing economic or commercial value, which specimens shall be marked, arranged, classified and described, and a record thereof preserved, showing the character thereof, and the place from whence obtained. The State Mineralogist shall also, as he has opportunity and means, collect, and in like manner preserve at said office, minerals, rocks and fossils of other States, Territories and countries, and the collections so made shall at all reasonable hours be open to public inspection, examination and study.

SEC. 2. It shall be the duty of the Governor to appoint a citizen of this State, having a practical and scientific knowledge of mining and mineralogy, to the office of State Mineralogist, to hold his said office for the term of four years, or until the appointment and qualification of his successor, who shall take and subscribe the oath of office prescribed by the Constitution, and who shall receive for his services a salary of three thousand dollars per annum, to be paid as other officers of the State are paid, and shall also receive his necessary traveling expenses when traveling on the business of his office, to be allowed and audited by the State Board of Examiners, the whole to be paid out of the mining bureau fund hereinafter provided for, and not otherwise.

SEC. 3. In addition to the collection, classification, arranging and preservation of specimens as provided in first section of this act, it shall be the duty of the State Mineralogist to make analytical assays as required, and when the funds in the mining bureau fund are sufficient therefor, to provide and maintain a library of works on mineralogy, geology and mining, to arrange in cases such specimens as he may collect, to procure and preserve models and drawings of mining machinery, and of milling machinery used in the reduction of ores, to correspond with established schools of mining and metallurgy, and obtained and preserve for public inspection and use such information respecting improvements in mining and mining machinery as will be of practical value to the people of this State; to visit the several mining districts in each county of the State, from time to time, ascertain and record their history, describe their geological formation and altitudes, the character of the mines and ores, and the general development of the district. At the close of each year he shall make a report in detail to the Governor, showing the amount of disbursements of the bureau under his charge, the number of specimens collected, and giving such statistical information in reference to mines and mining as shall be deemed important.

SEC. 4. The State Mineralogist may from time to time, and as the funds in the mining bureau fund will permit, appoint such assistants as he may deem necessary and proper for the carrying out of the objects of this act, and the efficient provision and maintenance of a bureau of mining information and statistics, and may procure and maintain the necessary rooms and furniture for the office and uses of the bureau in San Francisco; but the entire expenses of the bureau for salaries, assistance, rents, furniture, fuel, and all other things pertaining to the bureau must not, in any one year, be greater than can be paid out of the mining bureau fund herein provided for.

SEC. 5. For the purpose of establishing a fund for the maintenance of said mining bureau, it shall be the duty of the Tax Collectors in the several counties in this State, and of the License Collector of the city and county of San Francisco, on the second Monday in January, April, July and October in each year, to transmit by express to the State Treasurer all moneys collected by them from mining corporations, or from corporations formed for milling ores, or for supplying water for mining purposes, under or by virtue of the act entitled "An act imposing a tax on the issue of certificates of stock corporations," approved April 1, 1878, and to forward to the State Controller by mail a certificate showing the amount of money so forwarded to the State Treasurer, and the date when the same was transmitted, and also showing the names of the several corporations from which the same was received, and the amount received from each. The State Treasurer shall receive the amounts so transmitted and give duplicate receipts therefor, one of which shall be filed with the State Controller, and the other shall be returned by mail or return express to the Collector from whom the money was received; and after paying out of the money so received the charges for the transmission thereof, the amount of which shall be noted on the receipt filed with the State Controller, he shall retain the remainder in his hands as a separate fund, to be known as the mining bureau fund, to be used only in payment of drafts made for the expenses of the mining bureau established under this act, and out of which all the expenses of said bureau shall be paid.

SEC. 6. Such tax collectors and license collector shall hereafter be required to pay into the county treasuries of their respective counties only that portion of the moneys collected by them under the act of the Legislature mentioned in the last preceding section, which is collected from corporations other than those mentioned in section five of this act.

SEC. 7. This act shall take effect and be in force from and after its passage.

Is our Coal Oil Industry in Danger?

The United States has in the product of its oil wells an actual monopoly of coal oil in the markets of the world. It is to this country that all other nations have to look for their supply of that article. The production has reached the enormous amount of nearly 20,000,000 barrels per annum, and there does not appear to be any signs of a decrease save in some individual localities, which is fully compensated for by the discovery of new oil districts in many other sections of the Union.

But if we may credit the verity of the information which the cable wires bring to us, there appears to be an impending danger of a rival coming forward to contest our supremacy in the markets of Europe as producers of it. While it is somewhat singular that so important a subject should be confined to the meager record of a solitary dispatch, still it is not impossible that it may be founded on fact. If it should be so, we certainly will hear more fully from the oil basin in the Hanoverian region.

The amount produced thus far in the deepest borings there has been almost too insignificant to notice; being only four cwt., or about 60 to 70 gallons, equal to one and one-half barrels per oil well per day. Still, as the quality of the oil is improving as the borings deepen, which is generally the case in our own wells, it is not impossible that they may be approaching a permanent and extensive basin. The ancients knew of the existence of oil springs ages ago, but they only made use of the oil for external application as a relief for pains and bruises. That springs in different parts of Europe which give limited quantities of oil do exist is a well-established fact. If boring should be instituted in these places it might lead to new and important discoveries. A large flow of oil in Hanover would be detrimental to our sales in Europe; it would diminish them, if it did not cut them off altogether. But if it should effect the latter result, while it would lessen the demand and would materially deteriorate the value of our oil wells, it could not cripple them. Our own consumption of the oil is constantly increasing, and it is possible that the increase would equal the falling off which the loss of the markets of Europe would occasion.

Unless the yield in Europe becomes equal to the demand there, the discovery of oil basins can not have more than a temporary influence of this industry with us. But if their wells should prove as productive as our own, the effect would be serious, as they would then compete with our sales in other parts of the world. Had the prospects been at all flattering, we imagine the fact would have ere this been loudly proclaimed. It may be but a hoast, or perhaps only a hear movement in the oil markets.

MEXICAN MINING.—We learn that at the Candelaria mine, San Dimas, Mexico, the tunnel for draining the mine, upon which they have been working for 16 years, has been completed, and 400 feet of water drawn off. They find an abundance of good ore exposed, mainly silver but carrying about one-fifth of its value in gold. The company have just shipped a "Davis" grinder and another Payne engine, down to the mine from this city. The grinder is to be used in preparing the ore for the arastras, so as to increase their capacity. They do not propose to abandon the patio process. Plenty of water power is available for driving the arastras. They have used a Payne engine, which they bought of H. P. Gregory & Co., of this city, for two years, and it has given great satisfaction. The mine is owned by a private New York company and no stock has ever been put upon the market.

Tonite Powder.

A new company has been incorporated in this city with a capital stock of $1,000,000 in 10,000 shares, for the manufacture of Tonito powder. Among those connected with the company are Thomas Bell, Hamilton Smith, Jr., L. L. Robinson, Julius Baum, John Wedderspoon, William Ashhurner, W. Letts Oliver, David Cahn and R. L. Shainwald. The office of the company is at No. 123 California street, Mr. R. L. Shainwald being Secretary. It is proposed to erect large works near this city shortly for the manufacture of this powder.

Although just introduced on this coast the Tonite powder has been for several years in use in Europe, where it is known as "patent cotton powder." The special advantages claimed for the powder are its great power and safety, and the absence of smoke or noxious fumes. It may be used like common gunpowder and be free of danger of explosion in transit and in storage. Another point is that it is fit for service at all seasons and in all climates, never freezing as do the nitro-glycerine compounds.

We can probably give our readers the best idea of the qualities of this powder by quoting from a report on it by Prof. Attfield, London analyst, to the fire insurance officers, this gentleman having made the examination with special reference to the question of safety of transportation on railways.

With this object in view, Prof. Attfield suggested a series of experiments on a considerable scale, at the conclusion of which he expressed himself as satisfied that the cotton powder was less dangerous to handle, transport or store than common gunpowder. On the strength of this report, the railway authorities admitted of its transportation on all railroads in Great Britain on the same terms as ordinary gunpowder.

We quote Prof. Attfield's description of some of the experiments:

1st. A mass of iron weighing half a ton was let fall from a hight of 15 feet on to a box containing 10 or 12 pounds of powder. It did not ignite the powder.

2d. An unusually well-made powder barrel, strongly hooped and headed, containing between 30 and 40 pounds of the powder, in the form of cartridges of various sizes, was placed over some faggots saturated with tar, and a large bonfire kindled. In four minutes the cartridges ignited, and merely burned quietly for some 30 or 40 seconds. Every cartridge was entirely consumed without any explosion whatever.

3d. A box, holding 10 or 12 pounds of the powder, was next fired into from a rifle at a distance of about 20 yards. The bullet ignited the powder, which burnt rapidly but quietly away without explosion.

4th. A cartridge was placed in an open box containing two pounds of common gunpowder, and this latter fired by a fuse. The cartridge was blown some yards, but not exploded. The same cartridge was afterwards fired by the usual means.

5th. Strong sparks of electricity were next passed through some of the patent powder without effect.

6th. Many blows of an iron hammer on an iron anvil failed to ignite portions of the powder, and when ignition was at last effected, the adjacent portions of powder were merely blown on one side without being exploded.

7th. Concentrated acids (oil of vitriol and fuming nitric acid) were both successively and together poured on to portions of the powder without visible effect.

8th. Lastly, to show the power of this patent cotton gunpowder when intentionally exploded by detonation, a 12-inch baulk of timber was shattered by four small cartridges; a fountain of water 80 or 100 feet high was thrown up by the explosion of a floating box of the powder; and a hole in the marshes, eight feet across and four feet deep, was instantly produced on exploding 11 pounds of the powder.

All of these explosions of the Tonite were effected by special detonators, made for use with this powder. Prof. Attfield says with regard to the danger of spontaneous explosion, this powder is even less liable than ordinary gunpowder to this form of decomposition.

We are informed that the closest workings may be entered immediately after the explosion of this powder without any bad effects from noxious fumes. It can only be exploded by a special detonators.

We examined some of the cartridges of this powder prepared with a receptacle for the cap, so that nothing but the capped fuse is necessary to be inserted. It is not necessary to ram the charge or break it up to fit. The first-class cartridges are pressed by hydraulic power into a short stick like a candle, this being covered with paraffine, etc. Being excessively strong, labor is saved in drill holes, less holes being needed than with common explosives.

This Tonite or patent safety cotton powder is used not only for blasting, but for guns, torpedoes, etc., the preparation for these purposes being slightly different. An important point in its favor on this coast is its non-liability to freeze, heat or cold not affecting it. The company recently organized will soon begin to manufacture the article, when we shall have more to say on the subject.

The Payne Engine.

The accompanying engraving represents the Payne engine, with wrought-iron boiler. These engines are made in sizes from 3x4 up to 14x18, and a great number of the small ones are in use on this coast, all giving satisfaction. The engines are sold with or without boiler, and are supplied with the Taber automatic cut-off governor. Fig. 1 of the engravings show the engine and boiler combined; Fig. 2, the engine alone; and Fig. 3, details of the Taber governor.

The engine has some features not possessed by any other, among which are the following: The cylinder and frame and bottom of bearing are all contained in one casting and are all finished on centers, and the cylinder and guides bored at one time. Each engine is supplied with a substantial adjustable cross-head, with wrought-iron cranks. The valve is what is called the piston balanced valve, and works with the least possible friction. It is placed close to the cylinder, so as to have short ports, and leaves very little live steam between the valve and the piston head, thus making a saving of steam and giving the governor a great advantage.

The power of the governor is applied directly to the main valve of the engine without the intervention of a belt, which is very desirable, as many accidents have occurred of serious nature, caused by the breaking of a governor belt, or it having run off the pulleys—an occurrence that has happened one or more times in the experience of all who have been connected with engines and governors; and many times the effect of the governor is lost by a slipping belt. The motion of the engine can be readily changed fifty revolutions, by simply loosening or tightening the tension nuts on spring *E*. A large saving of fuel is accomplished by the use of this device—as the amount of steam entering the cylinder will be governed by the position of the eccentric on the shaft. The eccentric is operated by the weights *D*, which are thrown out by the centrifugal force, less or more, as work is applied to the engine.

The amount of steam admitted to the cylinder is governed by the position of the eccentric on the shaft, thus effecting a large saving of fuel. Messrs. H. P. Gregory & Co., Nos. 2 and 4 California street, in this city, are the agents. The design of the engine is handsome, and all the parts are finished in a perfect manner. A special boiler is made for yachts. It will set low in a boat. The liability of the upper ends of the flues leaking is obviated, as the water may be carried high enough to protect them from the fire, and yet it will furnish dry steam from the dome, which is in the smoke bonnet. The yacht engine is provided with reversing attachment, but with no balance wheel or governor.

THE gross earnings of the Chicago and Alton railroad for 1879 were $5,755,677—an increase of $1,083,158.

Legislative Matters.

Among the many bills for "regulating" dealing in mining stocks, Assemblyman Maybell's is the one which truly wants to wipe out the whole business. Not only that, the bill also proposes to legislate people into honesty, an effort in which we greatly hope Mr. Maybell may succeed. The sections are as follows:

SEC. 327. Every person who establishes, keeps open or conducts any stock exchange, stock board, or other place (except private brokers' or business office) for the purchase and sale of the shares of the capital stock of any corporation, or in any manner aids the same, is guilty of felony.

SEC. 328. Every person who buys, sells, gives away, or in any manner whatever furnishes or transfers to or for any other person any share or shares of the capital stock of a corporation, or any interest therein, or any paper, certificate, or instrument purporting to be such share, or any interest, in any place prohibited by the preceding section, is guilty of a felony.

SEC. 329. Every person who makes any false representation as to the value of any mine or any interest in any mine in any corporation, or who makes any pretended or fictitious sale for the purpose of inflating or depressing the real value of any such interest, is guilty of felony.

The following bill, introduced by Mr. Johnson, is probably intended to stop hydraulic mining, as Maybell's is to stop dealing in stocks.

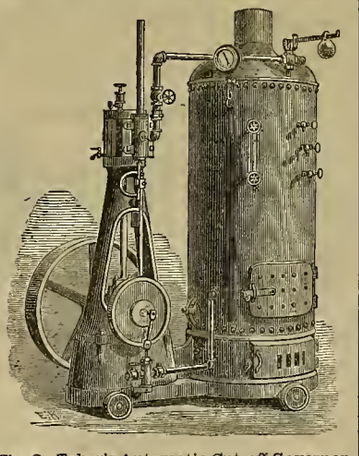

Fig. 3. Taber's Automatic Cut-off Governor.

The quartz interests will probably soon receive a set-back also:

SEC. 1. Every person who runs or permits to run from any mine, tailings or debris upon the land of another, is guilty of a misdemeanor, and upon conviction thereof shall be punished by a fine of $500, and by imprisonment in the county jail for six months.

SEC. 2. The offense shall be deemed to have been committed in the county where the lands are situated upon which the tailings have been run or permitted to be run.

SEC. 3. This act shall be in force from and after its passage.

Another bill by this same person is as follows:

SEC. 1. Every person or corporation injured in any manner by the flow of tailings or debris from the mine, may maintain an action for damages, jointly, against all persons and corporations contributing to such injury.

SEC. 2. This act shall be in force from and after its passage.

Still a third bill by Mr. Johnson is as follows:

SEC. 1. In any action for an injury to lands or possessions from the flow of tailings or debris from the mines, the plaintiff may unite as defendants all persons or corporations who have contributed to such injury, and the action shall be tried in the county where the injury is sustained.

SEC. 2. This act shall be in force from and after its passage.

The following bill, introduced by Mr. Wasson, of Mono, amends a similar bill passed in 1872, said act being for the special "protection of miners:"

SECTION 1. Section two of said act is amended so as to read as follows:

It shall be the duty of each corporation, association, owner or owners of any quartz mine or mines in this State, where it becomes necessary to work such mines beyond the depth of 300 feet, and where the number of men employed therein daily shall be 12 or more, to proceed to sink another shaft or construct a tunnel so as to connect with the main working shaft of such mine, as a mode of escape from underground accident or otherwise. And all corporations, associations, owner or owners of mines as aforesaid, working at a greater depth than 300 feet, not having any other mode of egress than from the main shaft, shall proceed as herein provided. All boilers used for generating steam in and about any quartz mine, or place where mining operations are carried on; all steam machinery used in the working of any mine, and all mechanical appliances of whatever character, such as cables, reels, cages, ladders, together with the timbering of shafts, drifts and other underground workings, shall be kept in thorough order, and every owner or agent of such mines shall have all these appliances inspected by a competent person at least every three months.

SEC. 2. Section three of said act is hereby amended so as to read as follows:

When any corporation, association, owner or owners of any quartz mine in this State shall fail to provide for the proper egress as herein contemplated, and where any accident shall occur, or any miner working therein be hurt or injured, and from such injury might have escaped, if the second mode of egress had existed; or if any miner or other employe of such corporation, association, or owner be hurt or injured by reason of any defective boiler, machinery, or other mechanical appliances for the working of mines owned by such persons aforesaid, or by reason of the employment by such owners or agents of incompetent persons to handle such machinery, then such owners of the mines where the injuries shall have occurred, shall be liable to the person injured in all damages that may accrue by reason thereof, and an action at law in a Court of competent jurisdiction may be maintained against the owner or owners of such mine, which owners shall be jointly or severally liable for such damages. And where death shall ensue from injuries received from any negligence on the part of the owners thereof, by reason of their failure to comply with any of the provisions of this act, the heirs or relatives surviving the deceased may commence an action for the recovery of such damages, as provided by an act entitled an act requiring compensation for causing death by wrongful act, neglect, or default, approved April 26th, 1862.

SEC. 3. This act shall take effect from and after its passage.

Mr. Wasson has introduced the following:

Resolved by the Assembly, the Senate concurring, That the thanks of the people of California are due and are hereby extended to Mr. John Mackay, of Nevada, for the generous and patriotic aid rendered by him to the Commissioners of California, appointed by the Governor to represent the State at the Paris exposition of 1878, by his donation of $5,000 to defray the cost of transmitting a large and valuable collection of specimens from the mineral resources of California to the French capital.

Resolved, That the Governor be requested to forward to Mr. Mackay a certified copy of this resolution, under the seal of the State.

THE Board of Health have declared that portion of this city known as "Chinatown" to be a nuisance.

CATHOLIC PRIESTS in Russia are instructed by the Pope not to mix in the political agitation there.

JAMES GORDON BENNETT has been sued for libel by Dr. William Street, who claims $50,000 damages.

Tests of Steel and Iron.

Nitric acid will produce a black spot on steel; the darker the spot the harder the steel. Iron, on the contrary, remains bright if touched with nitric acid.

Good steel in its soft state has a curved fracture and a uniform gray luster; in its hard state a dull silvery uniform white. Cracks, threads or sparkling particles denote bad quality.

Good steel will not bear a white heat without falling to pieces, and will crumble under the hammer at a bright red heat, while at a middling heat it may he drawn out under the hammer to a fine point.

Care should be taken that before attempting to draw it out to a point, the fracture is not concave; and should it be so, the end should be filled to an obtuse point before operating. Steel should be drawn out to a fine point and plunged into cold water; the fractured point should scratch glass. To test its toughness, place a fragment on a block of cast-iron; if good, it may be driven by the blow of a hammer into the cast iron; if poor, it will crush under the hlow.

A soft tough iron, if broken gradually, gives long silky fibers of leaden gray hue, which twist together and cohere before breaking.

A medium even grain with fibers denotes good iron.

Badly refined iron gives a short, blackish fiher on fracture. A very fine grain denotes hard steely iron, likely to be cold-short and hard.

Coarse grain, with bright, crystallized fracture or discolored spots, denotes cold-short brittle iron, which works easily when heated and welds well. Cracks on the edge of a bar are indications of hot-short iron. Good iron is readily heated, is soft under the hammer and throws out few sparks.

Testing and Working Silver Ores.

The above is the title of an illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron, which has been issued by Dewey & Co. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope:

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation test for silver, with heat and water, acid or hlow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working sample, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes the methods of working roasted ores, trestment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles, Smelting, Mexican process, Chilean process, Krochnke's process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

The book is a serviceable one for miners' and prospectors' use. Price, post free, $2.00. Address Dewey & Co., MINING AND SCIENTIFIC PRESS, 202 Sansome Street, San Francisco.

OF IMMENSE PRACTICAL VALUE TO EVERY SAW USER.

GRIMSHAW on SAWS!

History, Development and Action; Classification and Comparison; Manufacture, Care and Use of SAWS of all kinds. Large Octavo. Over 153 Illustrations.

By ROBERT GRIMSHAW, Ph. D.,

Member of the Jury on Wood-working Machinery at Paris Exposition of 1878.

This thorough work, impartially written in a clear, simple and practical style, treats the Saw scientifically, analyzing its action and work, and describing, under the leading classes of Reciprocating and Continuous Acting Saws, the various kinds of large and small hand, sash, Mulay, jig, drag, circular, cylinder and band Saws, as now and formerly used for crosscutting, ripping, scroll-cutting, and all other sawing operations in wood, stone and metal, ice, ivory, etc., in this country and abroad. With appendices concerning the details of manufacture, setting, swaging, gumming, filing, etc., tables of gauges, log measurements from 10 to 24 feet, and from 12 to 36 inches, lists of all U. S. Patents on Saws from 1790 to 1880, and other valuable information. Elegantly printed on extra heavy paper, wide margin, copiously indexed.

Owing to an increase of nearly 100% in number of pages and illustrations since first projected, the subscription price is this date made $2.00, postage paid, up to date of publication, after which time full retail price will be charged. In press Orders received now at subscription price, $2.00.

ROBERT GRIMSHAW,
624, 626 and 628 Market Street, Philadelphia.
January 1, 1880.

DEWEY & CO.'S

Scientific Press Patent Agency.

[ESTABLISHED 1860.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other Agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 202 Sansome St., S. F.

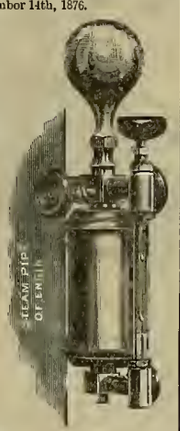
THE FAR-FAMED
AMERICAN LUBRICATOR.
Patented November 14th, 1876.



The American feeds oil into the steam pipe of the Engine, at a point above the throttle valve, THUS INFUSING THE STEAM WITH FOAM OF OIL, and as the Lubricated Steam passes through the Throttle, Governor, Steam Chest and Cylinder, it Lubricates all those parts.

EVERY DROP OF OIL IS VISIBLE as it passes into the steam pipe.

It imparts a regular motion to Engines, because it Lubricates the Governor Valve.

It will pay for itself in fuel every two months, in Oil every seven to 10 months, in wear, packing and labor every four months

It does all the above with absolute constancy, and with the small amount of Oil as shown in Catalogue, which please send for.

A Card from Architects.
The California Architect and Building Review.
Office, No. 240 Montgomery Street, San Francisco, Cal.
It is with pleasure that we publish the following from prominent Architects in this city:
Believing that a journal of its kind is a necessity on this coast, and judging from what has appeared in the "Quarterly Architectural Review," we are led to believe that the CALIFORNIA ARCHITECT AND BUILDING REVIEW will be worthy of generous support and encouragement. We therefore pledge our cordial sympathies, personally, and hope that the enterprise will receive kindly recognition and liberal support from all Architects and Builders and the public generally. Kendall's Spavin Cure
Is a sure cure for spavin, splint, curb, callous, sprains, swellings, galls, lameness and all enlargements of the joints or limbs. It will completely remove a bone spavin without blistering or causing a sore. It is also as good for man as for beast, and is used full strength at all times of the year with perfect safety. A cure which we are knowing to is a person who suffered 15 years with hip-joint lameness and was permanently cured two years ago with Kendall's Spavin Cure. Remember we claim it will cure a bone spavin and completely remove the bunch without blistering.

Office U. S. Marshal, Western Dist. of Michigan, Kalamazoo, April 15th, 1879.
B. J. Kendall, Enosburgh Falls, Vt.—DEAR SIR:—I received the two bottles of your spavin cure forwarded by express in January last. I am happy to state that it performed all your advertisement called for. In three weeks after I commenced using it the spavin was entirely removed and a valuable horse restored to usefulness. Very truly yours, JOHN PARKER.

Send for illustrated circular giving positive proof. Price, $1 All Druggists have it or can get it for you.

We would call the special attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our stock of Clay Crucibles, Muffles, Dry Cups, etc., manufactured by the Patent Plumbago Crucible Co., of London, England, for which we have been made *Sole Agents for the Pacific Coast.* Circulars with prices will be sent upon application.
Also, to our large and well adapted stock of

Assayers' Materials & Chemical Apparatus,

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast.
☞ Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application.

JOHN TAYLOR & CO.

W. BRUCKNER'S
ROASTING FURNACE
AND
Ore Pulverizers.

(Awarded the Premium Gold Medal at Naples, Italy.)

The furnace is especially adapted for roasting rebellious ores: there are more than fifty in use in Colorado, giving perfect satisfaction.
The Ore Pulverizer is built in different sizes. It is preferable to Stamp Mills because it requires less power and less repairs than Stamps. No extra expense for setting up, and no foundation. Less weight and less cost than stamps.
Furnished also in sections for packing.
For circulars and prices apply to

Ingersoll Rock Drills.

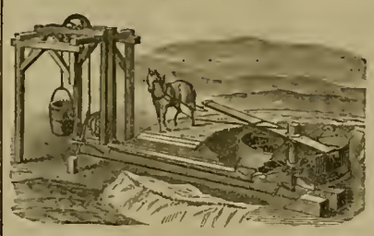
In use in the largest and best Mines of the Coast.

HAS AUTOMATIC FEED.

Has less Repairs.

Is Lighter and more Easily Adjusted than any other Drill.

Our DRY AIR COMPRESSORS are the most Economical Compressors in the Market.



MINERS' HORSE-POWER.

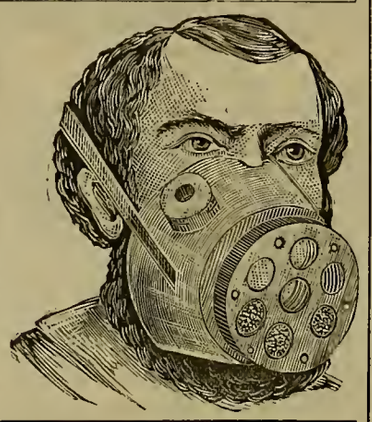
This Power Is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.
The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing

REYNOLDS & RIX, 49 Fremont Street, San Francisco.

PATENT

LIFE-SAVING RESPIRATOR

Prevents Lead Poisoning and Salivation.



INVALUABLE to those engaged in Dry Crushing Quartz Mills, Quicksilver Mines, Guano Works, White Lead Corroding, Feeding Threshing Machines and all occupations where the surrounding atmosphere is filled with dust, obnoxious smells or poisonous vapors. The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, $3 each, or $30 per dozen. Sent post-paid to any address upon receipt of price.

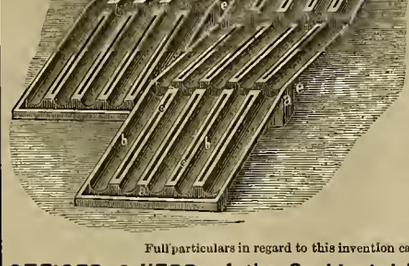
To be obtained of CROSS & CO., San Francisco.

Howland's Under-current, Mill and Sluice Riffle.



This invention meets a want which has long been felt by Gravel Miners and Millmen, viz.: that of a simple, cheap Riffle which will save the largest possible amount of gold or sulphurets, with the least possible waste of quicksilver. That this Riffle answers all these conditions will be apparent to any practical man who takes the trouble to examine it. The arrangement of this Riffle is such that there is a strong, unobstructed upper-current to carry off and break up the gravel or cement, and a slow under-current, checked by numerous riffles, which give gold or sulphurets a better opportunity of settling than if they were exposed to the force of the main current.

In this Riffle there are cast troughs for the quicksilver, which extend entirely across the sluice, and while they are so placed that the current will naturally pitch towards them, and give every opportunity for amalgamation, the quicksilver is fully protected from flouring or leakage. There is no mechanical skill required in taking out or replacing the sections.

Full particulars in regard to this invention can be obtained by applying to

STEIGER & KERR, of the Occidental Foundry, 137 First St., S. F.,

Who have the sole right of manufacturing this Riffle, and who will receive and attend to all orders.

Sanderson Bros. & Co.'s

will be connected and the mine speedily drained. This accomplished, the work of prospecting will be rapidly pushed forward.

ARIZONA.

ORO BLANCO ITEMS.—*Star:* Mr. S. S. Arnold, Superintendent of the Papago Chief mining company, is in the city. He reports the weather cold, with six inches of snow. Mr. Arnold has closed the contract with the Arivaca mill to deliver 100 tons of ore from the Longarina mine. The ore averages $200 per ton. The mill company guarantees 80% of the assay, and charges $25 per ton for turning ore into bullion. The mill company also pay for hauling the ore from the mine to the mill. The shaft in the Longarina is 100 ft deep, with two crosscuts and a drift. At least two tons of rich ore per day will he put on the dump. The contract has been let for work on the Sacramento and Papago Chief mines, which will be commenced at once. Work on the Peacock is progressing finely. The California is showing up well, and the large body of ore still continues. Gov. Stone, the President of the company, has brought out capital sufficient to make the most extensive developments on this property. A 100-ft shaft has just been completed on the Unthank mine. The Liberty mine will resume work in a few days. The money has been received to push developments. The Dorre mill and mining company are pushing their mill to completion, and are making considerable developments on their mines.

NELLIE JANES.—Is proving to be a bonanza. Two tunnels are being driven, all in ore, and from average assays taken for 23 days, across a five-ft vein, it was found that it contained $223 silver and 73% lead. Taking into consideration the vast amount of wood and water and the mammoth ledge, we predict, if this richness continues, that the Arizona bonanza is located in the Huachuas.

IRON CAP.—Yuma *Sentinel:* Down 170 ft in good pay ore. At the 100 level a drift has been run 60 ft; the ore assays $400 per ton in silver.

BLACK ROCK.—Is down 120 ft; the ore going $100 in silver.

PROMPTER.—*Citizen:* At the depth of 25 ft in a new shaft a body of rich carbonate and chloride ore has been discovered, which is reported to average over $300 per ton. Another shaft at a depth of 40 ft yields fine rock which averages about $75 per ton. Also a tuunel extending 40 ft, shows a superior quality of ore.

STOCKTON'S PASS.—This pass is 22 miles from Safford and 12 from Fort Grant. The first locations here were made a short time ago. The most important claims, as far as developed, are the Delaware and the Pioneer. The ledge is two and a half to three ft wide and traceable for from 1,800 to 1,900 ft without a break. The assays are simply marvelous, going $2,300 in silver and $722 in gold. The claims are situated on the north side and in plain sight of the main traveled road.

COLORADO.

EMMA.—Georgetown *Courier:* This claim is located on Democrat mountain. It had a mill run of first-class ore that returned 2,004 ounces in silver per ton, and 4,440 pounds second class that returned 956 ounces per ton. The back stope is 100 ft long, and with the exception of 15 ft it shows ore the whole distance, the ore vein ranging from one to four inches in thickness. The bottom of the shaft shows about an inch of copper pyrites that are worth $800 per ton, and four inches of quartz impregnated with rich silver ores, the value of which has not been ascertained. East of the whim shaft, in the 150 level, they are stoping on a vein of 500-ounce ore, from one to two inches in thickness. The ground worked out by these lessees has paid $300 per fathom, net. One stope 80 ft long, vein two and a half inches wide mills from 600 to 800 ounces per ton.

IDAHO.

MINING ITEMS.—*World*, Feb. 17: As soon as the Utah & Northern railroad is completed down Snake river, copper mining will give employment to a great many men. There are hundreds of miners there, some of the ledges being very wide, and 70% to 90% copper. They are near the line of the road, and in positions where they can be worked with but little expense. There are also copper mines on the Weiser. Those on Snake river are of sufficient extent to give Idaho a reputation abroad as a great field for this kind of mining as soon as the railroad is extended to them and they are worked. Mr. Ed. Carr, who returned from a trip across the Basin, informs us that a large body of ore, that will mill $100 or more to the ton, is being opened up in the Ebenezer, on Canyon creek. While at Quartzburg he visited the Justice, which, he says, is turning out good ore. The Montana has struck a bonanza. Over $17,000 worth of ore has been taken out since the first of January. It is working a small force of only four men, and grows richer. It is to-day among the richest mining properties on the coast.

MONTANA.

ALICE.—Butte *Miner*, Feb. 24: The second and third levels are prospected by drifts and crosscuts, and ore is being extracted across the full width of the vein, which is not less than 30 ft wide. On the fourth and fifth levels the ore body is improving in extent and richness, and the water has ceased to occasion any trouble. Fifty tons of ore are hoisted daily, 20 tons being sent to the mill for reduction and the remainder dumped as second-class ore. The ore worked mills $80, and the daily bullion output is about $1,000.

MAGNA CHARTA —Has resumed a contract to complete the tunnel the full length of the claim, and is being run in on the side of the ledge. When it is finished a series of crosscuts will be run to the vein and ore will he extracted and hoed on the dump to await the completion of the new Alice mill.

GAGNON.—The main shaft is down 225 ft, or 75 ft below the third level. From this point a crosscut will be run to the vein and a level started, which will prove that the value of the Gagnon, like that of other great properties of the camp, increases as depth is attained. But four men in one part of the mine have been employed in extracting ore, and the result of their labors has averaged 100 tons per week.

BURNETT.—The vein is six ft wide, low-grade ore; the daily output is about 12 tons.

NEW MEXICO.

GRANT COUNTY ITEMS.—*Herald*, Feb. 14: On the Copper King an 18-inch vein assaying 700 ounces has been struck. Mr. Williams has paying ore on four claims and five ft of good ore on the Copper Queen. Messrs. Lambert, Chick & May have commenced operations on the Bonanza, and discovered three claims on Silver creek, showing from one to four ft solid metal on the surface. Mr. Eddy shows 400-ounce ore at 10 ft from the surface on H. E. M. No. 2 Silver Bar. Mr. Miller's claim H. E. M. No. 1 Silver Bar shows metal the entire length of the drift. The Galveston Co. have some good mines and are prosecuting work with energy. The mine on Duck creek shows 1,000-ounce ore. The California Co. will commence operations on Silver creek. May & Co. will soon have their smelter in full blast. They are developing their claim, showing rich ore and plenty of it. Mr. Johnson shows rich ore on two claims. On the Silver Bar mine it is very good drifting, nothing to work in but solid metal. Twenty-four pounds of this ore gave returns of one and a half ounces of silver. Six different assays on the same ore run from 900 to 7,000 ounces.

NEW ISSUE.—Silver City *Herald:* The vein is 30 ft wide carrying iron pyrites with clean galena and chloride of silver. Assays run 30 ounces per ton. There are on the dump 200 tons of ore assorted and 150 not assorted. A tunnel is being driven to connect with the main shaft.

OREGON.

MINING ITEMS.—*Sentinel*, Feb. 11: Thawing at Sterling and piping resumed with a fair water supply. Miners in Josephine county are generally retarded in their operations by the freeze. The Applegate Gravel company are still busy with a flush head of water and working in good ground. Geo. McKnight, of Foots Creek, has been sojourning in town for his health. He reports the miners all very busy in that camp. The English company at Galice creek are now piping with about 800 inches of water, everything working satisfactorily. Miners in the Willow Springs camp are complaining of failing water, the freeze having locked up the springs for the present. Blue Gravel company is using about 600 inches of water, and prospects quite flattering. A few warm days will increase their water supply. The Squaw Lake company are now busy driving dirt through the flume again. Ditch all clear and no more interruptions looked for. The company is working in rich ground. From Mr. Chenoweth, just returned from the East, we learn that there is a good prospect that all the money necessary to complete the Grave Creek ditch will be raised, and that it will be pushed to completion next summer. The ditch will be 21 miles long, and will probably require an expenditure of $75,000. From our knowledge of this locality we have no hesitation in predicting that when this work is finished the property will be the most valuable in southern Oregon.

UTAH.

ELKHORN DISTRICT.—Salt Lake *Tribune:* Among the promising mining districts in the Territory is the Elkhorn, which adjoins Blue Ledge on the east, and distant from Park City about six miles. This district, from the character of the ore and its accessibility, is bound to attract the attention of capitalists. Specimens from the El Dorado and Mohawk assayed $90 in silver and $12 in gold. Some select samples have been found on the hill going as high as $75,000. A double-compartment shaft is sunk 55 ft, exposing a well-defined vein of free-milling ore five ft in width. The Crawford is situated half a mile north, and the ore assays from $27.50 to $32 in silver. The Eastern Cross and La Belle are down 15 ft and show good veins, assaying from $18 to $340 in silver.

AMERICAN FORK NOTES.—The Miller will start up again this season. The King of the West is making daily shipments. The Excelsior has a promising vein three ft wide. Character of ore chloride. There are several mines working in Silver Lake district. Shipments are being made from this district. The Pittsburg has about 300 tons on the dump ready for shipment. They are taking out from 10 to 15 tons daily. In the Russler ore worth $87 per ton has just been struck in the south drift. The Hidden Treasure main tunnel is in 200 ft on the vein, which carries bromide of silver six inches wide, and will assay from $100 to $300 per ton. Not far from this mine is situated the far-famed Rebel, which has produced over 5,000 tons of heavy lead ores that have averaged 60% lead and 45 ounces silver.

Those Tailings.

EDITORS PRESS:—Much as I should prefer to discuss points of general interest advertsd to in my communication of the 14th inst., to which Mr. Kustel has not replied, yet the attitude in which I am placed by that gentleman's letter in your issue of the 21st compels me, however unwillingly, to recur to this branch of the subject.

In giving the assay of what I believed to be Mr. Kustel's tailings I simply sought to answer in the shortest way an unwarrantable and arrogant assertion, while feeling that the gentleman's metallurgical reputation was too well established to be injured by sven his own inconsiderate verdict.

Mr. Kustel knows—must, as an experienced operator, know—that cases occur in which it *pays* better to leave $18 in the tailings than to leave less, as well as cases in which that amount in the tailings would indicate the extraction of 99% of the original content.

When I first took these works I was informed hy msn who lived in Melrose when Mr. Kustel worked, and live there still, that his pile of tailings contained $17 per ton in gold, and that a number of tons had been sold which the purchaser stated contained from $15 to $40 per ton in gold and silver.

Now it is no concern of mins if an operator leaves $28, or more, in his tailings, nor would I take on myself to say that he did not understand his business, at least without knowing the original richness of the ors or the circumstances under which he worked; but when that operator proclaims, from the dizzy hight of imagined superiority, that Deetken and I, and many others whom I consider to he his equals, who acknowledge to having left $18 per ton in certain cases, do not understand our business, I think it uot impertinent to the matter to show that he stands self-condemned; nor has Mr. Kustel yet *denied* that those wsre his tailings, nor that he has ever left so much in his tailings.

I find on further inquiry that, hesides Mr. Kustel, his son and Mr. Hofmann worked gold sulphurets here, and no one else. Mr. Oglehy worked gold quartz, not, however, hy chlorination, and his tailings (in sacks) contain only about $15 per ton. Mr. Stewart worked copper ore; his tailings contain gold, hut are very distinct. This fills the hill, making me the fifth since Mr. Kustel, as he says, and leaves the question of the production of those tailings hetween Mr. Kustel, his son and Mr. Hofmann.

The reason that the tailings were attributed to Mr. Kustel is that he was a constant visitor to the works, and was understood to be the superintendent all that time. All this is according to my iuformation. I enter into these particulars, of little public interest, hecause Mr. Kustel appears to charge me with "willingly misrepresenting," which I never do; neither am I in the habit of "blowing," as I understand that somewhat vague and not very elegant expression, and I think that he who should accuse me of either, would, in the eyes of those who know me, accuse himself of want of sense, or want of veracity.

I have now said all that I *wish* to say about this matter, and I sincerely hope that I shall not he compelled to further puncture the huhble of a self-constituted metallurgical oracle.

C. H. AARON.

Pacific Reduction Works, Feh. 23, 1880.

THIRTY-SIX miuing companies were recently stricken from the San Francisco Stock Board list, on account of non-payment of dues and other causes.

The Hofmann Process.

EDITORS PRESS:—The description of my improvsment on Plattuer's process for treating auriferous silverous and rehellious gold-hearing sulphurets, which you copied in your paper from Mr. Kustel's hook ("Roasting of Gold and Silver Ores," second edition), caused a discussion in which two gentlemen attacked the merits of my improvement, not in the manner of an impartial critic, hut in a way which shows their malicious intent to profit by attacking others. Both of these gentlemen ars engaged in working these kind of orss, to which my improvement relates, and their desire to make free use of the same is apparent.

I did not taks an active part in the discussion as I am opposed to newspaper controversies, especially when the parties with whom I havs to deal cannot argue by reason, hut put the whole force of their argument in personal attacks and sneers, as your two corrspondents did. If I, however, ask you to grant thess lines a space in your valuahls papsr, it is with the intention of explaining mattsrs and to bring this unpleasant controversy to an snd.

The concentrations of ths Colorado No. 2 G. & S. M. Co., of Monitor, Alpine county, range in value from $250 to $1,700 and $1,800 per ton, witb over 40% of the amount in gold. Owing to its refractory nature the ore never had heen worked successfully, and this valuahle property lay idle for many years. In March, 1879, when I undertook to work these concentrations, I soon found that hy the common chlorination process it was impossihle to extract more than 50% of ths gold, notwithstanding a vsry careful roasting. I therefors prepared the sulphurets in a different way, viz, roasting with salt and removiug hy leaching the hase metal chlorides and the chloride of silver hefore subjecting ths ore to the action of the chlorine gas, and was gratified with a very satisfactory result. This preparation of the ore for the chlorination process is new, and never was used hefore. Its value is proved hy the present prosperous condition of thc Colorado No. 2. It is immaterial by which chemicals this operation is performsd. It is sufficient to have the chlorides removed bsfore subjecting the ore to Plattner's process. Ths view of your correspondent, "Metallurgist," is correct; and Mr. Aaron's rsmarks about "re-treating tailings" and "coupling of well-known processes like cars," are therefore not pertinent and not applicahls to my improvement.

Messrs. Deetken and Aaron douht the advantage of my method; hoth tried it, and, as they say, without success. Tbis hsing the case, I am at a loss to understand ths rsason why those two gentlemen exert thsmselves so much. If my improvement is worthless, the "frivolous patsnt cannot trammel metallurgy" so much as to make it worth while for Mr. Aaron to hreak a lance in protection of his "adopted profession." He would serve the cause much more hy commencing war against that army of pretenders, recruited from all imaginahle trades, who, working as common hands for a short time in reduction works, adopt metallurgy as thsir profession, and trammel thereby the progress of metallurgy upon this coast to a great extent.

If Mr. Aaron in several instances terms my improvement a "suggestion of common sense," I do not take any offence at it, as many very valuahle improvements, after they are made known appear like common sense suggsstions; hut surely his expression is no compliment to himself, as he did not have himself such an "ohvious suggestion of common sense," and was ohliged to find out in a round-about way how I treated the Monitor sulphurets. By his remark: "As I seem to he the only person, hesides Mr. Knstel, who has treated gold-hearing sulphurets at thess works," etc., I have to conclude that he is one of the parties who worked gold and silver-bearing sulphurets at the Melrose works last spring, and encountered considerahle difficulties. Hearing of my success, one of the partners, provided with a muffls and crucihles, accompanied, as traveling assayer, a San Francisco capitalist, who came up to Monitor last May to look at the Colorado mine. Though I invited him to the use of the assay office, he did not make one assay, hut was during the whole time of his stay very industriously trying to find out how I treated the concentrations. Having received no information from Mr. Allen, the assayer, he went to my mill-hands when off shift, and other persons in town, till he obtained the main points. Notwithstanding my refusal of his request to visit the works, he went in through a back-door, where I found him in front of the tanks.

Having obtained in this manner, the knowledge of my improvement hefore it was puhlished, and very likely made use of it, Mr. Aaron finds it now very annoying to he checked hy a patent, hence his attack.

In one of his letters, I think in bis first, Mr. Aaron remarks that I applied steam in roasting. It is very singular—and there is where he gives himself away—how he came to the knowledge of this fact, as it had not heen mentioned in the publications referring to my improvement.

This may suffice. I purposely avoided asking any questions, and therefore neither expect nor wish an answer. Let the controversy come to an end. Neither of these gentlemen is "judge and jury" in this case.

OTTOKAR HOFMANN.

Genoa, Nev., Feb. 19th.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

[From Official Reports for the "Mining and Scientific Press," Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

FOR THE WEEK ENDING FEBRUARY 17, 1880.

224,606.—HAND STAMP—G. E. Emerson, S. F.
224,677.—TRUSS BRIDGE—R. W. Gorrill, S. F.
224,717.—GALVANIC BELT—C. Norwood, Winters, Cal.
224,560.—HORSE HITCHING DEVICE—R Seiders, S. F.
224,740.—TOASTING IRON—C. G. Stafford, Eureka, Cal.
224,742.—FIRE-ARM—A Swingle, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

News in Brief.

INDIAN affairs in Nebraska are quist.

THE Hudson river is now frse from ice.

THE alliance hetween Peru and Bolivia is off.

THE Utah Lsgislature adjourned Saturday last.

THE Prussian Diet has been adjourned by royal order.

ANOTHER insurgent plot has been discovered in Cuba.

THE severe weatber continuss in British Columhia.

GREECE has recognized the independence of Roumania.

THE distress in Ireland is again said to bs on the increass.

POMEROY COLLEY bas besn appointed Governor of Natal.

THE Czar wishes a state of siege to he proclaimed over Russia.

BARON VON SCHELL, Russian Privy Councilor, has committed suicide.

MANY wealthy Californians are emharking in business in New York.

THE horing of the St. Gothard tunnel will be finished in twelve days.

GENERAL LONGSTREET pronounces for Grant over all other candidates.

AN effort is being made in Washington to rsvive the duty on quinine.

THE Democratic National Convention will bs held at Cincinnati, June 22d.

EIGHT or ten persons are dying daily at Rio de Janeiro from yellow fever.

ADVICES from Tripoli state that 1,500 houses have heen destroyed hy floods.

THE uet earnings of ths Illinois Central rail road during 1879 wsrs $4,207,764.

IT is again reported from Glasgow tbat diamonds ars successfully made there.

THE Nihilists of St. Petershurg threaten to fire the Capital on ths 3d of March.

THE steamer *Gem* was recently sunk in Fraser river, having been cut through hy ics.

THE Mansion House Relief Committee's contrihutions to dats amount to £74,801.

IT is not improhahls that Gen. Grant will return from Mexico hy way of California.

GEN. GRANT and party arrived at Vera Cruz on the 18th inst., after a smooth voyage.

THERE is talk among San Francisco business men of rsviving the Committee of Safety.

THE Italian government offers prizes for vineyards raised from grafts of American vines.

THE Academy of Forest Culturs at Moscow, Russia, was destroyed hy fire Saturday last.

THE Geographical Society at Rome has conferred a gold medal upon Prof. Nordensjold.

A GENUINE Mormon colony has been discovered in Kentucky, numhsring ahout 50 persons.

AT Valparaiso recently twenty persons wsre killed hy an explosion of shells in the arsenal.

COLBY, ths murdercr of Harry Williams, at Santa Cruz, has heen respited by the Governor.

THE total number of persons killed hy the Winter Palace explosion at St. Pstershurg is ten.

THE Marysville Woolen Mills have closed, throwing about seventy persons out of employment.

New Incorporations.

The following companies have iucorporated and papers filed in the office of the Superior Court, Department No. 10, San Francisco:

NEVADA LUMBER CO.—Object: To operate in California and Nevada. Capital, $1,000,000. Directors—W. S. Hobart, A. Hayward, C. T. Bridge, W. E. Sell and S. H. Marlette.

BELDEN M. & M. CO.—Object: To mine in Nevada. Capital, $10,000,000. Trustees—G. W. Terrill, Thomas Holt, George L. Bradley, F. M. Luce and W. F. Belding.

HOLMES M. CO.—Object: To mine in Columbus district, Esmeralda county, Nevada. Capital, $10,000,000. Directors—Alsop J. Holmes, Gardner T. Lawton, Calvin G. Strong, William H. Sharp and Richard W. Heath.

FRESH attractions are constantly added to **Woodward's Gardens**, among which is Prof. Gruber's great educator, the Zoographicon. Each department increases daily, and the Pavilion performances are more popular than ever. All new novelties find a place at this wonderful resort. Prices remain as usual.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription, and request that they circulate the copy sent.

EXTRA COPIES can usually be had of each issue of this paper, if ordered early. Price, 10 cents, postpaid.

CHEW JACKSON'S BEST Sweet Navy Tobacco

Mining and Other Companies.

Atlanta Mining Company.—Location of principal place of business, San Francisco, California. Location of works, West Tintic Mining District, Juab County, Utah.

Notice is hereby given that at a meeting of the Board of Directors, held on the Second day of January, 1880, an assessment (No 1) of Five Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, room 7, No. 420 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Fifth [5th] day of February, 1880, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Friday, the Twenty-Seventh [27th] day of February, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—Room 7, No 420 Montgomery street, San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Thursday, February 26th, 1880, and the day of sale to Monday, the 22nd day of March, 1880. By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—Room 7, No. 420 Montgomery street, San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Wednesday, the 17th day of March, 1880, and the day of sale to Saturday, the 10th day of April, 1880. By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—room 7, No. 420 Montgomery St., San Francisco, California.

California and Oregon Land Company.—Principal place of business, San Francisco, California. Location of works, Lake and other counties, Oregon.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 5th day of February, 1880, an assessment of Thirty cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin, to the Secretary.

Any stock upon which this assessment shall remain unpaid on the 15th day of March, 1880, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Thursday, the 18th day of April, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

R. N. VAN BRUNT, Secretary.

Office, 318 Pine street, room 6, San Francisco, California.

Cataract and Wide West Gravel Mining Company. Principal place of business, San Francisco, California. Location of works, Eho Mining District, Calaveras County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 2nd day of February, 1880, an assessment (No. 2) of Twenty-five cents (25 cts.) per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin, to the Secretary at 26½ Kearny street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 8th day of March, 1880, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 29th day of March, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

WM. B. LAKE, Secretary.

Office, room 18, 26½ Kearny Street, San Francisco Cal.

Gover Mining and Milling Company.—Location of principal place of business, San Francisco, California. Location of works, Amador County, near Drytown, California.

NOTICE.—There are delinquent upon the following described stock on account of assessment (No. 40) levied on the Twenty-fourth day of December, 1870, the several amounts set opposite the names of the respectives shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount
Ashby, Mark T	7	5000	$500 00
Ashby, Mark T	16	500	50 00
Ashby, Mark T	19	1200	120 00
Drew, J P	254	500	50 00

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street, - - San Francisco, Cal.

SAVE YOUR GOLD!

Highly Important to Miners and Quartz Mill Men!

SILVER PLATED AMALGAMATING PLATES.

The best process yet discovered for saving fine or float gold. Extensively used with great success in gravel and quartz mining in various parts of the Pacific Coast. Over one thousand orders have been filled, and the demand is constantly increasing. Old Mining Plates bought or taken in exchange for new Silver Plated Plates. Gold extracted from old Plates at a moderate cost. Old Plates (which often contain a surplus of gold above the cost of plating) can be re-plated.

With the most extensive facilities on the Pacific Coast, orders can be filled very promptly and satisfaction guaranteed. All kinds of metal goods plated. Send for circular.

SAN FRANCISCO GOLD, SILVER, NICKEL AND COPPER PLATING WORKS,

Nos. 653 and 655 Mission Street, San Francisco, Cal.

SHEET IRON PIPE.

FRANCIS SMITH & CO.,

Manufacturers of

THE PATENT CHANNEL IRON WHEELBARROWS.

THE STRONGEST BARROW MADE. These Barrows are made by Superior Workmen, and of the best material. All sizes kept constantly on hand.

SHEET IRON PIPE.

Lap-Welded Pipe, all Sizes, from Three to Six Inches. Arteeian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.

Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.

Office and Manufactory, 130 Beale Street, San Francisco.

SHEET IRON PIPE.

STEEL CASTINGS

FROM 1-4 TO 10,000 lbs. WEIGHT.

True to pattern, sound and solid, of unequaled strength, toughness and durability.
An invaluable substitute for forgings or cast-iron requiring three-fold strength.
Gearing of all kinds, Shoes, Dies, Hammerheads, Crossheads for Locomotives, etc.
12,000 Crank Shafts of this Steel now running proved superior to wrought iron.
CRANK SHAFTS, CROSSHEADS and GEARING, specialties.
Circulars and Price Lists free. Address

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

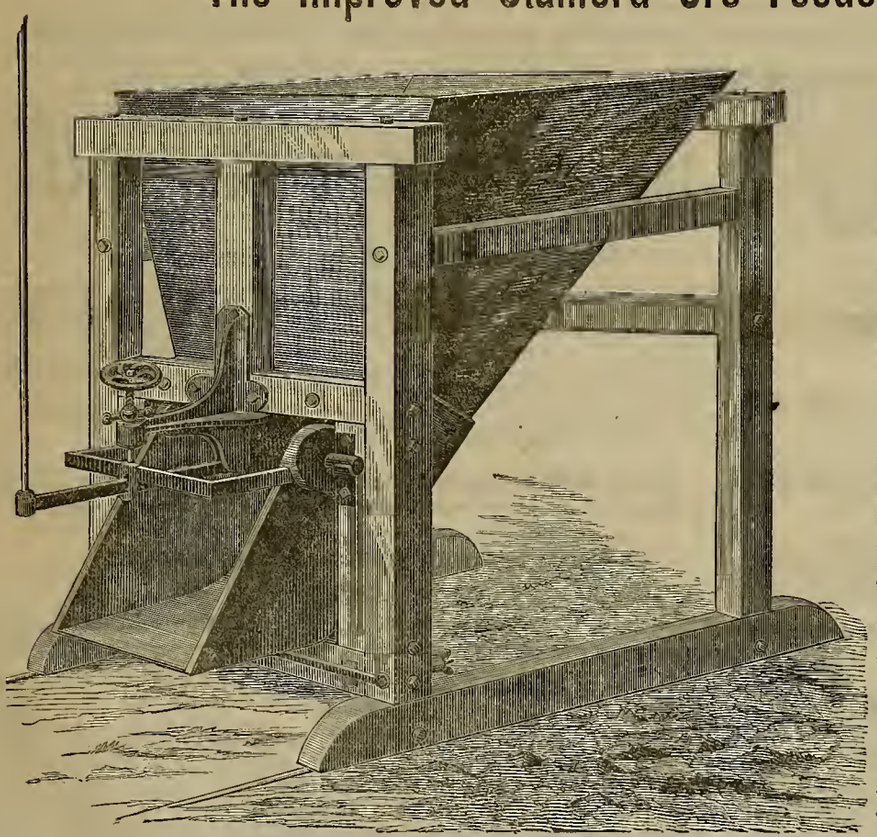
DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

Price Reduced to $75.

NOW IS THE TIME TO BUY CHEAP ORE FEEDERS!

The Improved Stanford Ore Feeder,



Next best in the market to the famous

Challenge

ORE FEEDER,

Can now be bought for

$75 EACH!

It is in use in many mills on this coast, and wherever used gives great satisfaction.

The STANFORD and CHALLENGE Feeders, made by me, have superseded the Victor Ore Feeders, furnished by E. T. Steen, in the Alexander mill, J. B. Cooper, President, office, Safe Deposit Building, S. F. By special permission I am enabled to refer interested parties to Mr. Cooper.

In this connection I will state that I will give $50 to be shown up to this date one of the Eclipse Ore Feeders, manufactured by Prescott, Scott & Co., of the Union Iron Works, which is in general successful practical operation at any quartz mill on this coast.

I have made a specialty of manufacturing ORE FEEDERS, and know which will give satisfaction for steady work. This Improved

Stanford Feeder

Which I sell for

$75.00

Will beat any one in use—always excepting the CHALLENGE, which is

The Best of all.

SAN FRANCISCO, SATURDAY, MARCH 6, 1880.

VOLUME XL Number 10.

The Direct Aid of Mining to Other Industries.

There are but few who ever consider how great an influence a profitable mine possesses over the industries of its immediate vicinity, nor how far that influence extends over the country. The discovery of a good paying ledge in a district that has never attained any notoriety in the world; that has never been cultivated to even a tithe of its capabilities of production; whose inhabitants have been sparsely scattered over its whole extent; in which for years past there has been no perceptible advance in wealth or population; and which, while the world at large has been progressing in knowledge, power and wealth, has remained positively stationary or has actually retrograded—gives to that district a marked and distinctive character, and brings it suddenly forward into prominence. It brings into it an active and energetic population who are intent upon finding other ledges and whose researches in this direction will still further add to its renown. It brings there mechanics whose skill is called into requisition in the erection of buildings, opening mines and all branches of skilled labor that a growing community absolutely needs. It produces a market for the productions of the neighboring farmers and creates a wider sphere of land cultivation. The valleys near it, and the hillsides which surround it, may never have produced aught save scanty herbage for pasturage. Under the progress which such a mine stimulates, these waste lands are made to yield bountiful crops, and instead of presenting features of semi-sterility and seeming desolation, they become scenes of prolific verdure. It calls into activity labor that has been dormant, and finds ample employment for a large retinue of sturdy workers, in all degrees of muscular toil. The wood-cutter, the charcoal-burner, the teamster, the hands above and underground, all find in the development of the mine a call for their services. The foundryman, powder and fuse makers, rolling mills and producers of steel, tool-makers and dealers in general supplies receive an impetus in their respective callings, by the orders for supplying the demands at the mine. Transporters from the mule team and stage, to the railroad, canal and steamers, obtain profits by the freight that passes through their hands and the passengers that travel upon their lines. One good mine extends the circle of labor through all the ramifications of society; it even calls upon other classes of mines than its own for a portion of their products. If it is producing bullion it requires iron, lead, copper, zinc and quicksilver in the construction of its appliances for mining and reduction of its ores; if it is producing any of these other metals, it needs the bullion for coinage of the standards of value in the sale and transfer of its own output.

Without the product of the mines agriculture could not have been extended to its present vast proportions. For without its metallic implements its efforts would be crude and limited. Manufactories could not exist if mines had never yielded the metals used in their machinery. The arts and sciences would never have beautified or enlightened the world were there no mines to furnish the material adapted to the construction of their instruments.

There is no industry that is not indebted to mining for its success and advancement. The tiller of the soil may gather his harvests, but his labors would be unavailing and his reaping be light were he not aided by the product of the mine. Commerce could not spread its sails to the breeze of every clime and return laden with the products of distant lands in exchange for the cargoes which it bore to them, had not mining antecedad its movements. To whatever point of labor we may turn we cannot fail to witness its undeniable obligations to the use of the product of the mines.

A Sanitary Suggestion.

It is the acknowledged duty of the Government to look after the welfare of citizens in circumstances where, from the nature of the case, they are not in position to look after it themselves.

There is one of these cases where the State can, we think, make a very good move in this direction, and that is in making arrangements for the examination of the drinking water supplied to the large cities and towns of the State, and to public institutions.

This matter has not been entirely neglected, as the State Board of Health have, from time to time, had analysis made of various questionable drinking water. At the same time water analysis, from their nature, occupy so much time and attention in being conducted, that the carrying out of a single analysis of this kind is an expensive operation. Nevertheless, if the analyses are required in greater numbers, it is also not difficult to so arrange the operation that quite a number can be carried on nearly simultaneously, with the outlay of but little extra time or labor. Hence, if it is possible to have a system of this kind, quite a number may be made for comparatively little cost.

The State University, at Berkeley, is admirably arranged for conducting such work. The chemical laboratories are well equipped and it possesses a corps of capable chemists. It is not to be expected that these instructors would have time enough to do the work required, but there are graduates of the College of Chemistry capable of performing the greater portion of the work, and by the labor of one of these, directed and assisted by the instructors, the work could be well done. In this way the only expense would be the compensation for the labor. The apparatus and supplies would be furnished by the University, and hence it would be necessary that the Prof. of Chemistry should assume general supervision of the work. This we are certain he would willingly do. If such an arrangement were made but for one year, we think that the satisfaction of having the water supplies of the State examined from time to time during the year would be ample compensation for the small expense incurred.

The selection of the waters to be examined would be naturally left to the State Board of Health, and we have no doubt that they would gladly assume the responsibility. The expense of transporting and collecting water could also be included in the appropriation. We commend consideration of this question to the Legislature.

The New Regents of the University.

The Governor has appointed as Regents of the State University: Wm. Ashburner, vice Bowie, term expired; J. Bidwell, vice Archer, term expired; B. B. Redding, vice F. M. Pixley, resigned.

We are very glad to see Governor Perkins make such good selections for these important positions. The Regents of the University receive no salary, but as the board have the entire management and control of this important institution, the position is an honorary one.

The selection of Mr. Ashburner is eminently proper, the gentleman being peculiarly fitted by education and experience to assist in the deliberations of the board. He is familiar with the workings of the institution and knows its needs. The Governor was no doubt cognizant of the fact that there was not in the board a representative of the great mining interests of the State, and selected Mr. Ashburner as such. It is only a matter of surprise that such an appointment was not made before.

Mr. B. B. Redding is land agent of the C. P. R. R., and is an energetic and intelligent gentleman, who has the best interests of this State at heart. Mr. Redding has written much on topics relative to the climate and the agricultural resources of California. He is one of the State Fish Commissioners, in which capacity he has done a great deal towards increasing our fish food supply, bringing intelligent and unceasing labor to bear on the work. He is a genial, well-informed gentleman, eminently fitted to have a seat in the Board of Regents.

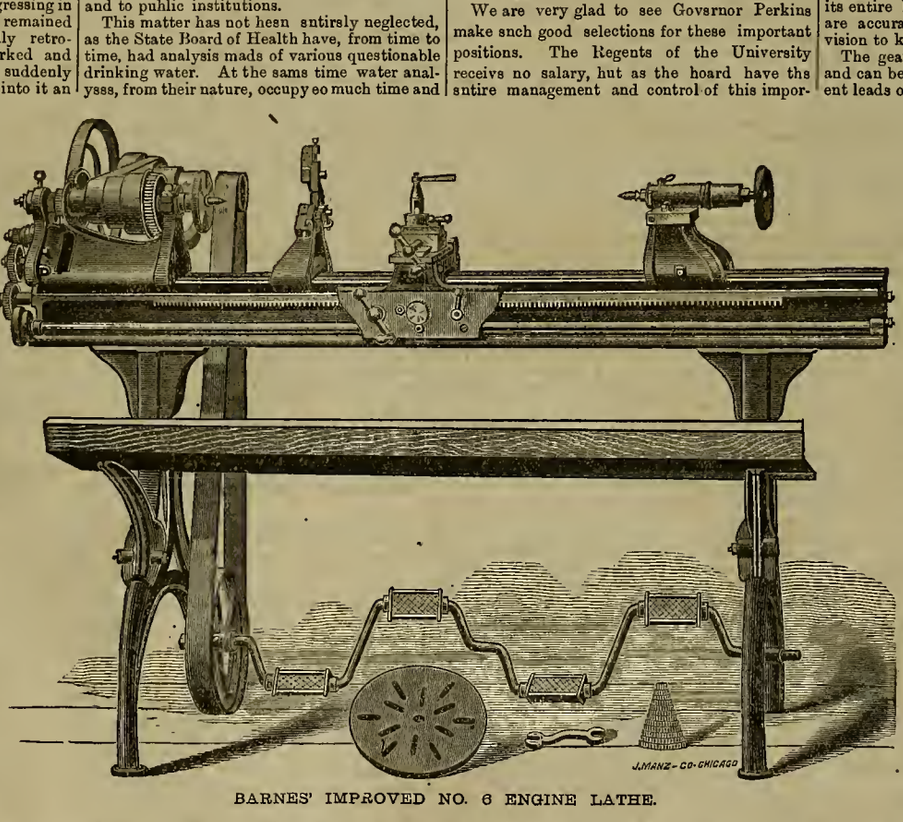
Mr. Bidwell is a well-known citizen, doubtless appointed as a representative of the agricultural interests. He is an active and zealous promoter of progressive enterprises, and well acquainted with matters pertaining to the industrial condition of the State.

An Improved Engine Lathe.

We illustrate on this page one of the Barnes patent engine lathes (No. 6), improved pattern. This lathe swings 12 inches on the face plate, 6 inches over the tool carriage, and will take work 44 inches long between centers. It is a very powerful back-geared engine lathe, and has all the necessary appliances for the rapid and accurate execution of light or heavy work. This size will best answer the requirements of those who want a lathe for general work of a heavier class than can be done on the No. 5 lathe, and yet within the range of foot power.

The head stock is very heavy, with a hollow steel spindle that will admit a 7-16 rod through its entire length. The boxes are of brass and are accurately fitted to the spindle, with provision to keep them true and take up wear.

The gearing is all cut from the solid metal, and can be combined to make some 500 different leads of thread; a table is attached to head stock giving the combinations for all threads in ordinary use. The cone has four changes of speed, and is run by a one and a half inch belt; this, with its back gearing and differential pulleys, has a greater range of speeds than has commonly been offered in a foot-power screw-cutting engine lathe for the price.



BARNES' IMPROVED NO. 6 ENGINE LATHE.

The tool carriage is a model of convenience and accuracy; it can be fed positively to either right or left as desired. The tool can be set to work at any position or angle desired; also to bore a taper hole or turn a ball, features not in ordinary movements of tool carriages. All wearing parts are gibbed and can be tightened up. The feed screw is under the bed and behind the rack where it cannot be injured; a friction feed rod is also provided, which can be used instead of the screw feed, thus saving that part for accurate use in screw cutting. Either the screw or rod feed may be instantly started, stopped or reversed at will.

The tail-stock can be set over for turning tapers; the spindle is cast steel with a true taper hole for the center; the center is hardened and self-discharging.

The patent velocipede foot motion used on this lathe gives a very great power; no balance wheel is required, as the foot motion is reciprocating and continuous, and there are no "dead centers" to overcome.

This lathe weighs 500 lbs., and the weight is all in the working parts, giving it great steadiness and strength.

These lathes may be seen in this city at Osborn & Alexander's, 628 Market street, agents for Barnes' foot-power machinery, and importers and dealers in mechanics' tools and hardware. Barnes' machinery comprises scroll and circular saws, turning lathes, foot-power mortisers, hand tenoning machines, etc., etc. This No. 6 lathe is sold for $170.

SUTRO TUNNEL CO.—On March 1st, the following Trustees were elected: Chas. W. Brush, W. H. Tillinghast, William Irvine, F. F. Low, Adolphe Sutro, Elliott J. Moore and David Cohn. The Trustees then met and elected Charles W. Brush, President; W. H. Tillinghast, Vice-President; Lazard Freres, Treasurers and the Registrars in San Francisco; the Union Trust Company, Registrar in New York; the Farmers' Loan and Trust Company, transfer agent in New York; Pelham W. Ames, Secretary. The resignation of Mr. Sutro as Superintendent, was accepted. The reports read showed that the expenditures of the company during the year amounted to $527,896.19, of which $489,380.82 was on the tunnel work. The following royalties were received during the year: From the Con. Virginia (half rates), $20,099.97; California (half rates), $15,633; Hale & Norcross, $2,450; Savage, $61,810; Gould & Curry, $43,260; Best & Belcher, $28,700. Total, $132,220.

Gum-lac from Arizona.

[Read before the California Academy of Sciences February 2, 1880.]

There was received lately at the Universsity, sent hy Mr. John A. Cnlhertson, of Phœnix, Arizona, a quantity of a substance of resinous character forming a coating of considerabls thickness on ths twigs of a plant, called in that neighborhood "greasewood," but which Prof. Hilgard assurss me is the *Larrea Mexicana*. The plant was identified hy meane of leaf, flower and seed sent hy Mr. Culbertson. The specimens wsre gathered in the vicinity of that place on the 22d of Decemher last.

The form of occurrence is the same as that in which the gum-lac of India and the East Indies occurs, as a coating of hard brittle resin of a red-dish color. Ths gum-lac from India is said to sometimes occur in layers a qnarter of an inch in thickness. In none of these is it so thick, hut in some exceeds an eighth of an inch in thickness, and in most of the specimens the gum is of nearly that thickness. The gum-lac is of cellular structure, and in these cells ars developed the ova of the insect (*Coccus lacca* or *C. ficus*), whose puncture is said to cause the exudation. Thess cavities are said also to coutain a red suhstance which prohahly serves as the food of the young insects and in which the eggs arc deposited. The specimen from Arizona exhihits the same structure, and in working with it, my fingere were often stained hy the crushing of soft pulpy matter of a hlood-red color, in whicb the eggs were visihls under ths lens.

The following properties of ths gum-lac given hy various authors have besn found to be also properties of the specimens examined hy me:

1. Contains a red coloring matter partly soluble in water (resemhling cochineal). I found about 3% in one test.

2. Partly soluhle in alcohol with a reddish color.

3. Almost entirely solubls iu dilute caustic alkalies with a deep red color.

4. The resin of the lac is soluhle in diluts horax solutions with a purplish-red color, and the solution, particularly when warm, has a psculiar sweetish odor. The resin of this prod-uct is also soluble in horax solution, the color is a little hrighter red than the shell-lac solution, and the odor stronger. This may he owing to the greater freshness of the Arizona product, as the shell-lac used for comparison was at least four or five years old.

5. The lac resin softens at comparatively low temperatures. This product also hecomes soft and plastic when it feels but just warm to ths touch.

6. When warm, has a peculiar aromatio odor.

Quantitative analyses of the crude lac, or stick-lac, have heen made hy several chemists with various rssults:

HATCHETT.

Resin	68.0	per cent.
Wax	6.0	" "
Coloring matter	10.0	" "
Gluten	5.5	" "
Foreign bodies	6.5	" "
Loss	4.0	" "

DR. JOHN.

Resin soluble in ether	66.65	per cent.
Resin insoluble in ether	16.75	" "
Laccic acid	0.62	" "
Coloring matter	3.75	" "
Extractive	3.92	" "
Insect skins	2.08	" "
Wax	1.67	" "
Salts	1.04	" "
Sand	.62	" "
Loss	2.90	" "

FRANKE.

Resin	65.7	per cent.
Substance of lac (Soluble in KHO)	28.3	" "
Coloring	0.6	" "
Total	94.6	per cent.

It will hs seen that an exact analysis of all constituents would not serve to establish identity when no two analyses agree on the constituents evon approximately:

	Hatchett.	Dr. John.	Franke.
Resins	68.0	83.40	65.7
Coloring matter	10.0	3.75	0.6

Partial analyses, however, would at least throw some light on the question.

I hoiled a portion of the Arizona stick-lac, carefully removed from the twigs, with water, and thereby extracted 3% of deep red coloring matter. The residue was then extracted with boiling alcohol until no more would dissolve. About 61.7% of extract was thus ohtained, prohahly mostly resin. Of the residue a large portion dissolved easily in dilute KHO, and the alkaline solution was of a deep purple-red color. A portion also dissolved more slowly in dilute KHO on hoiling, and was reprecipitated hy addition of acetic acid as a gelatinous flaky precipitate. The coloring matter dissolved by KHO was, howevsr, not thus reprecipitated, hut its color, hleached by acetic acid, was restored in the filtrate tberefrom hy again adding dilute caustic potash.

A second, more thorough and extendsd examination was made hy first extracting the powdered resin (dried hefors weighing) with absolute alcohol, which was found to leave the coloring matter nearly all behind, thsn extracting the coloring mattsr hy hoiling the residue with watsr, then extracting the residue from this operation with dilute caustic potash. The final residus was dried and weighed, the alcoholic and aqueous extracts also evaporated and weighed, the KHO solution precipitatsd with acetic acid, and the precipitated mass wasbed, dried and weighed. By this process there was lost a certain amount of coloring matter soluhle in KHO and not reprecipitated hy acetic acid, but to hs detected in the filtrate and wash water.

The results of this determination gave:

Resin soluble in alcohol	61.7
Coloring matter soluble in water	1.4
Resin (?) and other bodies soluble in KHO	26.3
Residue insoluble in all these solvents	6.0
Loss (including coloring matter soluble in KHO, but not in water)	4.6
Total	100.0

The 26.3% soluble in KHO and not in alcohol appears to be ths suhstance, or collection of substances more prohahly, which Franke called "material of the lac" (Muspratt's chemistry), and which he finds to he 28.3% in his analysis of India stick-lac.

It will be seen how closely the gum-lac of Arizona agrees with all characteristic properties of the varieties from India, which in the form of stick-lac on the twigs, or as seed-lac when hroken from the twigs and ths coloring matter partly removed, or after melting and straining as shell-lac, which is used for varnishes and in the making of sealing wax. The red coloring matter or lac-dye is also used as a dye stuff—superior in some respects to cochineal (Muspratt). In composition also it agrees, as will he seen from the ahove analysss, as nearly as can he judged from the imperfect data and discordant analyses quoted. These disagreements are partly due to different methods of analysis—partly, quite probahly, to real differences in differsnt specimens, and partly to differsnt intsrpretation of results of analysis.

It would bs very interesting to have the Arizona *Coccus* examined and identified, or at least compared with the *Coccus lacca* or *C. ficus* of India, as their modes of life as well as the products of their activity appear identical.

J. M. STILLMAN.

Universsity of California, Jan. 30, 1880.

Leadville, by an Old Nevada Miner.

Mr. John H. Daly is in receipt of an interesting letter from an old White Pine friend, now operating in Leadville. We are permitted to make the following extract from it:

It is hard to predict the future of this camp. There are vast quantities of ore in sight in the mines, yet they all think they will find other hodies underlying the ones they are now working. To me it looks douhtful, especially on Carbonate and Fryer hills, whsre ths principal mines now are. Higher up in tbe hills I think thsy will find other contacts and pay-mineral hy sinking deeper than the ore hodies now discovered, for ths front mines have a slight dip into the hills. If no other hodies of ors are found on Fryer and Carhonats hills, it is only a matter of time for them to work out. But it will take some time to work out the ore in sight. So that, with ths nsw strikes that ars certain to hs made, will keep ths excitement up the coming season. Of course the outside districts will help very much. There never was a mining camp so well advertised as this. I never saw property sell for a quarter of the prices one can get here. Any hole that shows some pay ore, will sell for from $50,000 to $150,000. Good paying mines that are shipping ore, with a good hody in sight, sell from $250,000 up into the millions. Prospsct shafts, without a color of minsral, sell for from $10,000 to $50,000, according to ths locality, while eome bring $100,000, without any pay minsral in sight. It is ths opinion of every one, or most of them, that all you havs to do is to sink dsep enough to find the mineral. The tender-fest got the best of this country, for old miners would not sink "blind," and thus thsy missed big fortunes hy not doing it. It is a good deal like Chlorids Flat. The mineral is found hy sinking, without any surface indications. Any shaft or claim near one that has struck good ore, can bs sold for a good prics.—*Eureka Sentinel.*

ELBOW DISTRICT.—New finds are the order of the day in Esmeralda county, and will no douht continue to he for some time to come, as the county is only just beginning to hs prospected. For years parties have noticed the fine formation of that section of country lying at and in the vicinity of Elbow station, 16 miles west of Aurora, on the road to Carson, and it is donhtful if any one would have known what treasnres were hidden there, had not R. F. Jerdon hroken off a piece of rock and had it assayed; the result was $30 a ton. He immediately staked off a claim. As soon as the ahove facts wers made known the community was all excitement, and claims were located in every direction. The first location is ahout a quarter of a mile from Elbow station. A meeting was called at which the local mining laws governing Esmeralda district, with a few alterations, wers adopted, R. F. Jsrdon elected Recorder, and the nams of Elhow was given the district. Work has already hegun on ssveral of the locations, some of which show fine ledges with perfect foot and hanging walls.—*Esmeralda Herald, Feb. 21st.*

THE penalties for ohstructing census takers, who bsgin their lahors on ths first Monday of June, are severe. The law says: All psrsons ahove the age of 21 years who shall refuse to furnish the information required hy the supervisor or enumerator shall forfeit and pay a sum not exceeding $100, to be recovered in action of dsbt. Presidents, directors or other officials of privats corporations who refuss to furnish information required of them, are made liahls to a penalty not to exceed $10,000.

Public Lands Commission Report.

The forthcoming report of the Puhlic Lands Commission will recommend that swamp and pasturage lands hereafter he surveyed and patented by townships; that hetter provisions he made for making houndaries of surveyed tracts; that ths system of letting puhlic survsys and houndaries between States and Tarritories he hereafter mads under ths direction of ths Coast and Geodstic Survey. It will also, probahly, recommend that the offics of Receiver at each local land offics bs aholished. There ars about 95 of thess officers. It will aleo recommend the classing of puhlic lands into five general classes—arable, irrigahle, pasturage, timher and minsral. It will also recommend ths repeal of the pre-emption law, on the gronnd that its chief use now is to increass large individual holdings. Ths commission will prohahly supplement it by another, making arahle public lands disposable under the Homestead laws. The commission will probably recommend no limit he placed upon amounts of irrigahle land which any one person may huy; that the land he sold at 25 cents per acre, one-fifth to he paid down and the halance at the end of three years, and that no patent to snch lands he issued until it is shown that a specified sum per acre, say $2, has hesn expended on its reclamation. Lands classsd as pasturage, will comprise untimhered and new mineral lands, not arahle or capahle of irrigation.

The commission will prohahly recommend that the quantity one psrson may huy he not limited, and that ths prics he graduated as follows: All lands sold prior to January, 1886, be at ths rats of $1.25 per acrs, and all lands sold from the latter date to Jauuary, 1890, to bc at the rats of $1 an acre. Aftsr the last named date all lands remaining hs sold at 75 csnts an acre, with a reduction of 12½ cents psr acre svery thres years until the minimum prics of 12½ cents is reached. Pasturage lands shall he opened to homestead settlement, no one entry to comprise more than 2,560 acres. It will probahly recommend that colonies of 20 or more families may enter homesteads either on arahle, irrigable or pasturage lands, and lay out a village in the csnter of the tract.

Radical changss will hs recommended in the mineral land laws, among them the following: That the time during which a prospector or discoverer shall bs able to hold his claim by possessory title shall he fixed and limited by law; that all local organizations aud regulations respecting mining titles shall hs aholished and the sole jurisdiction of all questions rslating thereto bs resarved by the United States; that the "lode location," which permits the discovsrer to follow a lods any distance, in any direction, whether within the houndaries of his surface location or not, be repealed; that hereaftsr every mining claim shall comprise a certain numher of feet, breadth and length on the surfacs, and that suhtsrranean property rights shall not extend beyond the surface boundaries thus fixed. It is quite prohahle that the commission may refrain for ths present from making any rscommendation as to the area which each location may comprise. It also recommends that a system of official survsy and mineral inspection he adopted to prevent hlackmail and rohhsry, and to ohviate the necessity of legal contests hefors claims ars patented.

The Belmont Concentrating Mill.

It is well known that there are largs quantities of low-grade ore in the Belmont mine that will not pay to mill. About thres months ago the company concluded to erect a concentrating mill near ths mine, and on the 19th inst. it started up and was kept running until the 28th. The result proved heyond a doubt that the low-grade ores in the Belmont mine can he profitahly concentrated. The mill is 30 hy 60 feet. There are hut five stamps up, ths frams is huilt for 10 stamps, and the additional five will be put in place soon. The engine is of 40-horse power, and is run hy a portahle hoiler, which is not largs enough to furnish sufficient steam. It will he replaced hy a larger one. The process under which these ores are worked is very simpls. The ors is run from ths shaft to the mill—a distance 80 feet—into a self-feedsr, from where it runs into the separator, whence it is carried to the hlanket slnices whers the sulphurets are saved. The average assay of ore passing through the battery is $25 per ton, and the concentrations assay from $75 to $100 per ton. The cost of putting this ore through the hattery and hlankets is hut $3 per ton, and the five stamps can easily reduce 12½ tons per day. There are two large tanks, one for the sluices and another for washing the hlankets. The sluices are 350 feet long, hut it is the intention to made them longer. Ths sluices work well, and after the first 150 feet scarcsly a trace of sulphurets can he detected, thus proving that they are caught hy the hlankets. This concentrator is a great triumph for the company, as they now have a sure and profitahle method of working ths thousands of tons of low-grade ore in the mine. A Whits furnace and some pans and settlers will he put in. Chloriders can now go to work with a will, for the cost of reducing will hs materially lessened.—*Belmont Courier.*

THERE are very few coal mining companies that can figure up a profit on last year's husinese. It is stated that there was less money realized last year from the husiness of 26,000,000 tons than there was from ths 17,500,000 of the year preceding.—*Coal Trade Journal.*

Are Telephones Telegraphs?

A somewbat singular discussion, involving tbs question as to whether telsphones are telsgraphs, has arisen in England, growing ont of the fact of ths connection of the Postoffics Department thers with ths telegraph. An application has been made for an injunction against ths Telephone company to restrain them from discharging their functions, except under ths Post-office regulation in relation to the telegraph. After some considerahls discussion it has heen arranged that an injunction should not he taken, hut that ths defendant companies were to keep certain accounts until the hearing and final dscision of ths cass.

The argument on bshalf of the Postoffice ie that telephones are telegraphs within the meaning of ths act by which the latter inventione were committed to the chargs of the Postoffice Department, and the Attorney-General represented it to he a serious grievance that the government, after spending millions on telegraphs, now found their monopoly interfered with hy telephones, which, he submitted, were practically the same invontion. The government had, thersfore, hs said, hsgun these proceedings by information in the Court of Exchequer.

It is reported, although this part of the question was not mentioned during the hearing, that they hope to be able to compel the telephone companies to take out licenses from ths Post-master-General, and pay royalties for doing so. The *Times* has an editorial on this subject, which concludes as follows: "The proposal to obstruct the developmsnt of the invention is one it would he impossihle to defend. The fiscal argument is simply irrelevant. If the nation made a bad hargain in forgetfulness of the admitted commercial principle that few patents ars worth more than three years' purchass of thc receipts arising from them, the nation must hear the loss, however great it may be. It will not hs diminished otherwise than apparently, hy restricting the use of telephones. If any such restriction is sanctioned hy the courts, it can scarcsly fail to he removed by the direct intervention of the legislature. A tax npon telephones would he practically a tax upon knowledge. Any sucb imposts belong to the past rather than to the present or futurs."

STRIKE IN THE QUINN MINE.—At the Quinn mine, Spring Valley, helow Silver City, they cut into genuine hlack sulphuret ore of the richest character. The ore is not only rich in black sulphuret of silver, hut also shows native and ruhy silvsr. A hox of the ore was brought to this city. The sample showed $794.85 gold and $29.65 silver, making a total of $824.50. Hitherto it has heen just the other way. The hundreds have heen in silver and the tens in gold. A day or two since we took a piece of porphyry from the Quinn to Wiegand & Co., who madc a careful assay and found it to contain $1.60 gold and $19.90 silvsr, or a total of $21.50. The rock did not contain a particle of quartz, but had a look of heing mineralized. It was a portion of a houlder of considerahle size that was encountersd in the midst of the ore hody. This rich ore is found at a depth of but 100 feet beneath the surface. Indeed the paying ore is found quits up to the surface, but it is of a very different appearance from that cut into. That at or near the surfacs is of a yellow or rsddish hue, while ths ore just found is, as we have said ahove, genuine hlack sulphuret. The shaft was sunk to the depth of 100 feet when a crosscut was started to the wcst. This crosscut wae driven 70 feet when a deposit of ore 15 feet in width was cut. This ore was of a very even quality, hardly an assay going hslow $12 and few over $55. The strike was in drifting north in the 15-foot vein. Here the rich black sulphuret ors suddsnly showed itself. It was but six or eight inches wids whsn it first appeared, hut within a yard it had attained a width of two feet. It would seem to he the apex of a chimney of splendid ore. Where this strike has heen made is 150 feet north of where the last rich oro was found on the surface and nnder a point where nothing is to hs seen on the top of the gronnd. The Quinn is on a direct line with the Yellow Jacket nsw works, the Forman shaft and other shafts on the lode.—*Territorial Enterprise.*

EASTERN CAPITAL IN MINES.—An articls in tbe Nsw York *Tribune* says: Twsnty million dollars would he a very low estimate of the amount of Eastern capital invested in Western mining enterprises during the past year. Tbe Fifth Avenne hotel is the mining rendevouz of this city, and it is safe to say that one-third of the men who throng ths main corridor from 7:30 to 10 P. M. havs mines to ssll. As you saunter through the crowd the words "mine," "ore," "shaft" and "dividend" are heard on all sides. Some of ths hest properties shnn pnhlicity. "No stock for sale" is a conspicuons advertisement of some companies. This announcement is supposed hy many to hs a ruse, hut it is simply the truth. The stock of four of ths largest mining companies in Leadville has heen taken in large hlocks for investment only. A dividend of $100,000 declared a few days ago will he paid with fewer than a dozen checks. Large properties placed recently have heen sold in lots of not less than 1,000 shares each.

LAST year Colorado produced $2,310,000 worth of coal, and $16,300,426 worth of gold and silver bullion.

MECHANICAL PROGRESS.

Progressing.

The idea of making a train lay down and take up its own rails as it moves along is not a new one, but an interesting realization of the progress which is being made in that direction is now to be witnessed in the Jardin des Tuileries, Paris. The system is that of Clement Ador. The rails on either side of the carriages consist of a series of jointed pieces of rail, with flat supporting pieces; they inclose the system of wheels, passing down over the front and up over the end wheels, and all the wheels have two flanges to prevent any derailment. In front the chains of rail are guided by two distributing wheels, which are governed by the traction, so that on pulling obliquely, right or left, the endless way automatically follows the same direction. At the end of the train, again, are two taking-up wheels, provided with differential motion to meet the difficulty of going in curves, which involves an extension of the rail on one side and a contraction of that on the other, so that whatever the curve (to six or seven meters radius) the way is regularly put down and lifted.

From the mechanical point of view one is struck with the smallness of the force required to move a train thus arranged. In the Jardin des Tuileries the train consists of three carriages, capable of containing in all thirty children, and often full. These are drawn by two goats, which work thus for seven hours. The total load is rather more than a ton. To draw a like weight in three carriages on ordinary roads would require a dozen goats, four for each vehicle. The economy of carriage, then, is incontestable. The normal speed is three to four miles per hour. The system is, of course, not designed for passenger traffic, but for goods, and in many places, with bad roads or none, might be very serviceable.

LUBRICATING BEARINGS.—It is impossible for a bearing to run cool until the high places upon it are so reduced that there will be a uniform film of unguent between the two surfaces. It is a custom for purchasing agents, and in some cases for practical men, when ordering oil, to mention simply "lubricating oil," without specifying the kind of bearings for which it is to be used. The latter is a very essential point. Frequently when the oil is received, it is found to give very poor satisfaction, and some of the bearings are found to run hot. Under these circumstances, the oil is generally charged with the fault, when, in reality, the fault has been in giving the order. A good lubricant for a small, close-fitting, fast-running bearing must be of a very fine quality, and have a light body, in order to distribute itself between the close-fitting surfaces. Such a lubricant is entirely unfit for large bearings, where more body is required to carry the heavy weight which is placed upon them. It is the practice in most shops to use the same kind of lubricating oil for all the machinery, which, when properly considered, is both unreasonable and extravagant, for the reason that a bearing when improperly lubricated is worn away much faster than it would otherwise be, and on fine machinery the lost motion in the bearings requires frequent attention.—*Mechanical Journal.*

INTERESTING TO FOUNDRYMEN.—It is well known that cheaper classes of pig iron contain a certain percentage of sulphur and phosphorus, the separation of both or either of these elements is very desirable, but can not easily be effected in the cupola which is used in most foundries. A contemporary suggests the following simple method, which can be tried at but a trifling expense, and which may improve the character of the iron: To every hundred pounds of iron add from three-fourths to one and one-half pounds of peroxide of manganese, and smelt it together in the usual way in the cupola, then when the iron is tapped from the furnace into the pot or ladle, take a handful of a mixture composed of one part of dry air-slacked lime, and with two parts of oxide of iron or common bog iron ore, have this mixture well dried and pulverized so as to pass through a 60-wire screen, syringe the same over the surface of the melted iron, stir it up with a rod, and then either skim it from the surface or hold the slag back in pouring it into the molds. We have tried the above and find the texture of the iron greatly improved. Manganese ore and bog iron ore can be found in any quantity in California, and at a very low price.

WELDING TUBES AND TIRES.—Herr Krupp, of Essen, Germany, has recently patented in Germany a method of welding tubes and tires, which is based upon an excellent idea, although the practical details recommended by him do not strike us as being very well elaborated. He draws the tube over one of a pair of ordinary rolls, and then heats the whole length of the portions to be welded by a special contrivance, which is a portable fire-box, into which air is so blown that the heat is directed against the weld. After the necessary heat is attained the rolls are set in motion and the place to be welded is repeatedly drawn through them. His heating apparatus appears to us clumsy, and could, we believe, be replaced to advantage by some gas apparatus similar to that used for heating wagon tires in this country and in France.

THE COCKERILL CLASSIFICATION OF STEEL.—The famous Societe Cockerill, of Seraing, Belgium, classify the steel made at their establishment as follows: All steel containing from 0.05% to 0.20% of carbon is graded as extra mild. It has a tensile strength of from 25 to 32 tons per square inch, and an elongation of from 20% to 27% in 8-inch bars. This steel may be welded, but does not temper, and is used chiefly for girder plates, ship and boiler plates, wire, nails, etc. The second class embraces metal ranging in carbon from 0.20% to 0.35%. It possesses a higher tensile strength, from 32 to 38 tons per square inch, but less ductility, the elongation being 15% to 20%. It hardens little and can scarcely be welded, and is the material from which the Cockerill Works make some of their rails, axles, tires and guns. The third class, that of hard steel, is characterized by a percentage of carbon varying between 0.35% and 0.50%, a tensile strength of 38 to 46 tons per square inch, and an elongation ranging from 15% to 20%. It does not weld, but may be tempered. It is used for rails, tires, springs, guide bars of steam engines, spindles, hammers, etc. The hardest steel, having a percentage of carbon varying from 0.50% to 0.68%, is capable of bearing a strain of from 46 to 51 tons per square inch, while it elongates only from 5% to 10% in sample bars 8 inches long. It cannot be welded, but takes a strong temper, and is for that reason used for various cutting tools, files, saws and delicate springs.

COATING METALS WITH BRASS.—Herr J. J. Hesz, of Vienna, claims to have developed a good method for coating metals with brass by electricity. He states that the greatest trouble experienced hitherto in accomplishing this has been to obtain a bath which has the power of dissolving both copper and zinc well, so that alloys of the two may be dissolved and deposited uniformly. With former solutions too strong a current would yield a grayish deposit of zinc, and too weak a current would give a pale reddish color, while in the most favorable case a poor yellow was obtained. He prepares his solution in the following way: Dissolve 84 parts, by weight, of bicarbonate of soda, 54 parts of chloride of ammonium and 13 parts of cyanide of potassium in 2,000 parts, by weight, of water. Then cover the sides of the vessel containing the bath with sheet brass, cast, not rolled, and suspend a sheet in the bath, the former acting as a node and the latter as cathode. After allowing the current to pass through for an hour, the bath will be prepared for any objects to be coated with the same alloy.

NEW VISE AND ANVIL DRILL.—A combination tool consisting of a vise and anvil combined with a drill attachment is being introduced into the machine shops at the East. It is said to be of great convenience and utility. With this tool the work can be held in the jaws of the vise in any desirable position, and a hole may be drilled either straight or at any required angle. It seems well adapted to the work of machinists and all other mechanics working in metals. It is fastened on a bench like an ordinary vise. The drill press can be removed in an instant when the vise or anvil is wanted separately. This combination tool is capable of a wide range of application in various kinds of iron and steel hand work. It is well made in all its parts, and only the best materials are used in its construction. The shaft to which the drill press is fastened and the spindle are both made of steel. Each machine is furnished with a chuck capable of holding drills from half an inch down.

THE SHOP ANGLE.—It is well known that the Sellers, or American standard screw thread, is an angle of sixty degrees, but it may not be generally known that this angle is adapted to many other purposes in the machine shop. It is the best angle for lathe centers, for the cutting edge of lathe and plane tools, for the edge of the cold chisel, the edge of the center drill, the lips of pin drills or counter-bores, the teeth of reamers, the teeth of milling tools, and in short most of the edges used for cutting metals, even the edges of shears for cutting sheet metals. To obtain this angle on tools, gauges should be used in the shop, and the tools and lathe centers ground and finished to them. These gauges may be made of different sizes, one large enough to gauge lathe centers, and another small enough to gauge the edges of cutters, stationary or rotary.

HOW TO DRILL CHILLED CAST IRON.—J. W. Nichols, Windsor, Mass., writes to the *Blacksmith and Wheelwright* as follows: Chilled cast-iron sleigh shoes and other pieces of cast iron too hard to drill can be softened successfully by the following method: Heat the part you wish to drill nearly to a white heat. Then make a hole in the coal in your bin large enough to admit your casting, and pack the coal carefully about the heated portion. Let it remain until cold, when it may be easily drilled. I have tried Chose's recipes and others, but they do not give as good results as the above.

RULE for finding the weight necessary to put on a safety valve lever, when the area of valve, pressure, etc., are known: Multiply the area of the valve by the pressure in pounds per square inch; multiply this product by the distance of the valve from the fulcrum; multiply the weight of the lever by one-half its length (or its center of gravity); then multiply the weight of the valve and stem by their distance from the fulcrum; add these last two products together, subtract their sum from the first product, and divide the remainder by the length of the lever; the quotient will be the *weight* required.

SCIENTIFIC PROGRESS.

Man's Prehistoric Progress.

The caves, tombs and gravel drifts of the earth, which are of all objects the most uninteresting to the casual observer, have in our days become strangely eloquent. At the touch of science they have lent a voice to the dumb past. Raising the veil of antiquity, they have unrolled page after page of ancient history, written neither with pen, nor pencil, but stamped on the rude implements of war or the chase, imprinted on the few threads of decaying tissue that inwrap the crumbling skeleton, engraved on the bracelet of bronze or silver that encircled the slender wrist of some prehistoric beauty, or chased on the brooch of gold that clasped the mantle of some renowned but forgotten chieftain.

So exact are the deductions to be drawn from these mute records of the past that they have been divided into four well-defined ages—the drift age, the age of polished stone, the age of bronze and the age of iron; each of these marking an advance in knowledge and civilization which amounted to a revolution in the then existing manners and customs of the world. The drift age or paleolithic period is marked by deposits of rude stone implements; to it succeeds the neolithic, or age of polished stone, in which the same stone implements were in use, but of a superior class, highly polished and well finished.

The wandering savage who lived by the chase and cut up his prey with the rude, unpolished flint knives of the paleolithic age was coeval with many extinct animals which then ranged over the forests that in those early times quite generally covered the earth. In the caves the rudest occupy the lowest strata; showing that even in that remote age man had the same tendency to improve as now. Some of the remains of the ancient Nimrods have been found in caves and sepulchral tumuli; and of all the living races of men they resemble the Esquimaux most closely. With them are found the remains of such extinct animals as the cave bear, mammoth and woolly rhinoceros.

The neolithic era marked the dawn of a new and higher civilization. In many parts of England, collections of polished stone implements have been found, such as stone axes and adzes, chisels, gouges, small saws, hammers, awls for boring, stone picks for turning up the soil, pestles, mortars, querns and spindle-whorls. Needles have also been found, which imply a knowledge of the art of sewing; and vessels of rude earthenware, which show that these old-world folks could ply the potter's craft with a considerable degree of deftness. They possessed the horse, a small short-horned ox, two kinds of swine, goats and horned sheep, with dogs of a large breed. Their dwellings seem to have consisted of pits roofed with wattle. They were all built, or, rather, scooped out upon one plan. There was a circular shaft for an entrance, going down to a depth of from seven to eight feet, five to seven feet wide at the bottom, and narrowing to three at the top; and round this was a chamber or cluster of chambers. In these huts are found a variety of polished stone implements, bones of the domesticated animals and shreds of pottery. The flint of which these stone implements are made was obtained by quarrying for the flint nodules in the chalk. Many of these mines with the mining tools still remain.

In some instances, caves seem to have been used as dwellings; and, where not employed as a shelter for the living, have been frequently selected as a resting-place for the dead. In these cave mausoleums, numerous skeletons of both sexes and of all ages are found. From the quantities of calcined bones found in some of these graves, it is believed that, in the case of a chief, human sacrifice may have been offered. From the number of these tombs and dwellings, we are led to the conclusion that Europe had in those days a somewhat large and tolerably civilized population, who had flocks and herds, who practiced agriculture, and who were hunters and fishermen.

In the lake dwellings of Switzerland, which are assigned to this era, many interesting discoveries have been made. Three kinds of wheat have been found; also two kinds of barley, two kinds of millet, the remains of fruit such as apples and pears, peas, flax and weeds. For their cattle and swine the lake dwellers seem to have laid up winter fodder in the shape of acorns and beechnuts. They made cloth of the flax, and could even weave it into an ornamental pattern.

However acquired, the possession of bronze marks an era of advancement. The dwellings of the people who used it were better, and their circumstances more comfortable than the tribes they succeeded. They had axes and sickles of bronze, gouges, chisels, hammers and knives; and, as a natural consequence, all the products of their labor were superior and better finished. They could weave well a tough and strong fabric, and their clothes were formed of several pieces sewed together. Their cloth is almost invariably of linen—no woolen cloth belonging to this period having been found either in France or Switzerland; but in a wooded coffin discovered in 1861 at Ribe, in Jutland, the remains of a body was found inclosed in a cloak of coarse woolen cloth; a woolen cap covered the head, the lower limbs wrapped in woolen leggings. Another coffin contained the paraphernalia of an ancient belle, a brooch, a knife, a double-pointed awl, and a pair of tweezers—all of bronze, two studs, one of bronze and one of tin, and a javelin head of flint. Bodies wrapped in woolen cloth have also been found in Britain. It is, however, worthy of remark that it is only in the exceptional cases in which the body is turned into adipocere (an unctuous, waxy substance), that woolen cloth is found; in normal circumstances that fabric would disappear far more rapidly than linen.

The bronze remains found in the Rhone valley prove that the art of metal-working, once acquired, was carried by these early races to great perfection. They were acquainted with the processes of casting, tempering, stamping and engraving metal. With this discovery of a new art came a simultaneous improvement in the potter's craft; the rude cups of the neolithic age disappear, and are succeeded by vessels of an endless variety of form and ornamentation, some of which are extremely beautiful. Some of the vases are inlaid with tin, others are marked with the same patterns employed to decorate the Etruscan vases of Italy; while others, found in the pile-dwellings of the Lake of Bourget, have representations of men and animals. The collections of bronze jewelry are also abundant and curious. They consist of bracelets, armlets, long hairpins with decorated heads, rings, ear-rings, girdles adorned with pendants, brooches, buttons, studs and torques for the neck.

In primeval times, many animals were abundant all over Europe, which seem gradually to have disappeared, such as the cave-hyena, the cave-lion, the mammoth, the woolly-haired rhinoceros, the hippopotamus, the musk-ox, the Irish elk, the wild horse, the glutton, the reindeer, the aurochs, and the urus or wild ox.

With regard to the antiquity of man, Sir John Lubbock comes to the conclusion that man certainly existed in Western Europe during the period of the mammoth, and the presumption is that he also existed in pliocene and even in miocene times; but the proofs of that are to be sought, he thinks, in warm, almost in tropical climates.

From the manners and customs of modern savages much light may be thrown upon the early condition of prehistoric man. After considering the condition and progress of the Hottentots, South Sea Islanders, Esquimaux and others, Sir John Lubbock remarks that, "it is impossible not to admire the skill with which they use their weapons and implements, their ingenuity in hunting and fishing, and their close and accurate powers of observation." By all these qualities we may suppose prehistoric man to have been distinguished in at least an equal degree.

It is evident that man when he first spread over the surface of the earth must have been in a condition represented by the lowest type of savage. Then by slow degrees, by imitation, and by the teaching of experience, the capacity of lodging and clothing himself, and of improving his simple implements, would develop and expand, until man, physically one of the weakest and most unprotected of all animals, would, by dint of that subtle force which we term mind, make himself independent of nature, and at last, "monarch of all he surveyed," and able to cope in his native coverts with the shaggy lion, and overtake in the chase the fleet stag or bounding antelope.

The wild man, like the wild beast, is always timid, always suspicious, always on the watch; and the condition of the savage woman is still more cruel. "She shares," says Sir John Lubbock, "all the sufferings of her mate, and has also to bear his ill-humor and ill-usage. Even the possession of beauty, far from being an alleviation, is only an aggravation of the evils of her lot, by securing for her a hard taskmaster to many masters."

With growing civilization, on the other hand, come security and confidence, and that sense of justice and honor which is the best protection of the weak; and with the increasing and ameliorating influences of science, a great improvement may still be looked for in the condition of our race. We stand, perchance, upon the threshold of a future, brighter than even the brightest dreams of our past; on the verge of a Utopia long deemed impossible, when the moral nature, unvitiated by an erring will, shall no longer fetter the eager soul to base aims and unworthy aspirations, but shall leave it to its free scope and native regality of birthright and action. Then to the human race, still in its vast masses so ineffably degarded, a new and more mighty civilization may unlock boundless stores of knowledge and power, and unseal fresh fountains of pure and unfailing enjoyment.—*Condensed from Chambers' Journal.*

AN UNEXPECTED COMET.—Dr. Gould, formerly of the Dudley observatory, Albany, N. Y., but now Director of the Cordoba observatory, South America, has telegraphed to New York that a great comet is in the neighborhood of the sun, passing northward. No large comet has been expected this year, and no small one at this season, Winnecke's comet not being due until near the end of this year. Reports by mail are awaited with great interest. Should Dr. Gould's dispatch be confirmed, a new member must be admitted to our cometary system; and possibly the nations north of the equator may also be treated to a sight of it.

Mining Share Market.

There is no seeming escape from the death-like stillness which rests upon stock transactions. The leading brokers are not making their expenses. The fluctuations in prices have not afforded a line for profit, they having been so meager. When a spurt is produced, it falls to pieces suddenly because the holders of the stock put it on the market to make sure of the first trifling advance.

The principal event of interest in stock circles is the disposal by Mr. Flood of all his Comstock mining interests to Mr. Mackay, one of his partners, the consideration being understood to be five million dollars. Mr. Flood wishes to confine his attention solely to his banking interests. The transaction exercised no special commotion in the stock market, which fact in itself is a striking comment on the position of stock business just now. A few years ago it would have been considered an indication of lose of faith in the mines by Mr. Flood, and would have occasioned a bad break. But the market is now "broke" so bad it cannot be much worse.

Mr. Mackay is now the "mining king" of the United States, if not of the world.

Dispatches inform us of a slight set back in mining stock matters in New York, occasioned by the break in the Little Pittsburg, of Colorado. This will no doubt set the New Yorkers to thinking a little, and give them an idea that it is not best to confine all their operations to one particular section. This has been the great mistake of operators here, who would not go off the Comstock, and for many years nobody would look at a mine unless in that vicinity. We have learned better now in the bitter school of experience. The New Yorkers have abiding faith in Colorado, and the collapse of a few schemes there would cause a great commotion among investors.

It may be stated in this connection, that the California mines *not* on the Board are all in a prosperous condition, notwithstanding the depressed State of the stock market.

Mr. Sutro has resigned his position as superintendent of the tunnel which bears his name, and Mr. J. W. Taylor is appointed his successor.

Bullion Shipments.*

Since our last issue, we have noticed the following bullion shipments:

Alexander, Feb. 16, $3,493.57; Feb. 18, $1,790.02; Feb. 20, $2,351.81; Ontario, Feb. 23, $7,947.56; Feb. 24, $4,372.41; Feb. 25, $3,815.76; Feb. 26, $3,687.09; Feb. 27, $3,768.21; Feb. 28, $3,352.12; Wells, Fargo & Co., at Eureka, Feb. 24, $1,235.75; Feb. 25, $1,000; Feb. 26, $2,000; Feb. 28, $3,162.22; Richmond, Feb. 24, $15,434.77; Feb. 28, $22,391.84; Horn Silver, Feb. 24, $6,000; McCormick & Co., received Feb. 24, $13,712; Feb. 25, $5,450; Feb. 27, $10,727; Feb. 28, $2,285; Stormont, Feb. 24, $7,962.38; Christy, Feb. 24, $3,608.23; Tybo Con., Feb. 26 (one week), $4,257.50; Argenta, Feb. 25, $12,667; Paradise, Feb. 26, $3,600; Feb. 28, $4,758.18; Eureka Con., for Jan., $129,600; Feb. 29 (past week), 205,975 lbs.; Hannington & Mellor, Feb. 27, $5,000; Star, for Feb., $17,492.

*Desiring to make our list of Bullion Shipments as complete as possible, we will be thankful to receive from mining Superintendents and Secretaries notice of all bullion shipments from their respective mines.

THE total coinage of the various Mints during February was $8,169,969, of which $2,300,400 were silver dollars.

DURING the month of February 902,000 pieces were coined at the Mint in this city of the value of $2,540,000.

THE public debt was decreased $5,672,019 in February.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

ZEILE.—*Ledger*, Feb. 28: A new shaft is being sunk 150 ft from the present one. It has reached a depth of 35 ft, and carpenters are at work putting up hoisting works. Some fair-looking ore has been met with in this shaft, yielding good paying prospects.

STEWART'S SULPHURET WORKS.—The new chlorination works of Stewart & Co., at Sutter Creek are running steadily on sulphurets from the Lincoln mine, and are yielding remarkably well. There is a sufficient quantity of sulphurets on hand to last six months, and with the daily output of the mill, the prospect is that the works will be kept running for the next 12 months.

BUTTE.

WYANOTTE.—Orroville *Mercury*, Feb. 27: Eight of the 23 boxes were cleaned up after a 19 days' run. The result was $818. The above yield is one-third of a bit of 6,000 cubic yards; 225 yards are being worked daily.

MINING ITEM.—The Hendricks and Perkins mining claims, in Morris ravine, have been bonded for four months, in the amount of $500,000. The consolidated properties consist of 1,300 acres of patented land, believed to comprise some of the best hydraulic ground in the county, and the water rights, flumes, machinery, etc., now used in working the Hendricks claim. The new company is known as the Morris Ravine mining company.

FORESTVILLE ITEM.—Oroville *Register*, Feb. 28: The winter has been so cold that mining operations have been suspended most of the time during the last two months. If the snow upon the mountains does not go off with a warm rain, the prospect is very encouraging to our miners who depend for their water upon natural channels. The quartz mining prospects of this section were never so good as they are at present, and we predict for Forbesville and vicinity a celebrity as a quartz section, in the near future, unsurpassed by any portion of the county.

CALAVERAS.

MINING JOTS.—*Chronicle*, Feb. 28: A very wide and promising vein of quartz has lately been struck in the San Pedro, at Glencoe. Work is progressing steadily at the old Enterprise Con., near West Point. The new process of working the ore will probably prove successful. Sinking continues at the Champion. In this vicinity but little hydraulicing has been "indulged" in during the week, on account of "breaks" in the ditch.

MARIN.

KING RANCH.—*Journal*, Feb. 26: Is located at the foot of Tamalpais mountain. Assays of ore yielded: Gold, $54.15; silver, $7.90 per ton. Eight hundred pounds have been milled at San Francisco, with very favorable results.

SAN RAFAEL.—Several tons taken to San Francisco were amalgamated by the new process known as the A. C. Tichenor Lead Fusion furnace—that is, through hot lead, instead of by quicksilver. William Gardner, Assayer for A. C. Tichenor & Co., in his official report to President Briggs, says: "I have carefully assayed the pulp from six sacks of ore furnished by the San Rafael and Coast Range mining company, after having been run through a chamber of hot lead, and it showed barely a trace of any residum of metal. I also assayed the lead after the pulp had been run through the hot lead, and found it to have been increased or enriched thereby at the rate of $21.62 per ton of 2,000 pounds of pulp."

MARIPOSA.

MINING ITEMS.—*Gazette*, Feb. 28: The Washington is in full blast, giving employment to quite a number of men in the mine and on the surface. The No. 9 is being worked with good results. The Pool has several men employed. The rock pays from $14 to $10 per ton, with a good prospect ahead. The partiee from Oakland who recently purchased the Silver lead are pumping out the water. This is an old mine, and has produced, formerly, considerable gold.

MONO.

BELVIDERE.—*Free Press*, Feb. 20: The rich strike is now a fixed fact. Its extent, so far ae uncovered, and its extraordinary richness, place it on the list of bonanzas. Striking it in the shaft, driving 60 ft and raising on the ledge 30 ft, all in high-grade ore, with the ore extending above cast, and below not yet opened, places this mine in the front rank of the rich mines of Bodie. The ore body already developed extends from face of north drift to face of joint south drift, 113 ft. It is known to extend to the main shaft, which will make it 150 ft in length. An assay taken from the upraise went: Gold, $5,144.55; silver, $510.22; total, $5,054.77.

CON. PACIFIC.—The north drift, 400 level, has a total length of 142 ft. During the past week, stringers of quartz have been cut and the drift cut into a large vein of quartz of fair-milling grade the entire width of the drift. The south drift, same level, has a total length of 132 ft.

TIOGA CON.—The shaft is sunk 704 ft. The connection with the Syndicate is now accomplished. The ventilation is complete, the up-cast being in favor of the Tioga. It will save 523 ft of hoisting or pumping of water, and the hoisting and transportation of ore. The upraise on vein No. 3 is, in all, up 131 ft, incline measurement. The vein at this point is about three ft thick, the walls being well defined.

JUPITER.—Excellent progress is being made on the 500 level. The west crosscut from the end of the main south drift is now in 70 ft. The west crosscut from the end of south drift No. 2 is in 30 ft in favorable ground.

ADDENDA.—The new three-compartment shaft has been sunk and timbered 58 ft in the past two weeks; total depth, 189 ft.

UNIVERSITY.—The main shaft is down 357 ft. The ground is improving and growing softer, carrying quartz stringers.

QUEEN BEE.—Bodie *News*, Feb. 26: The north drift from the cast crosscut, 400 level, has now a total length of 136 ft. The ledge improves as the drift advances. The whole face of the drift is in ore. The ledge porphyry and foreign matter in this drift is pinching out and the ore body increasing.

KING BEE.—The double-compartment shaft is down 100 ft. Drift on lode No. 1 shows a ledge three and one-half ft wide of good ore, with clean-cut walls.

BOOKER.—Still drifting on the vein at the 300 level. The ledge is strong, and carries three ft of good milling ore; improving as the drift is advanced. Work at the 400 level is being pressed. The drifts on the ledge, both north and south, have been advanced 40 ft on each. The vein is of a good quality of ore, fully equal to that of the 300 level.

SOUTH BULWER.—Sinking the main two-compartment shaft; total depth, 524 ft. For the past few days have been carrying down the timbering close to the bottom, lowering the pump and putting in additional length of air pipe. The Burleigh drills work well, and sinking is now progressing rapidly. The formation is favorable for sinking, the bottom being in quartz and clay, indicating the near approach to a ledge.

ORIGINAL SUMMIT.—Still drifting on the vein at the 100 level. The vein continues very rich, and increases in size as advance is made. The prospects of this mine are exceedingly good.

SOUTH NOONDAY.—The double-compartment shaft has reached 153 ft, at which point a station has been cut out and crosscutting east and west commenced. The east crosscut is in 15 ft. Expect to cut the ledge on this level in 35 ft. The west crosscut will be run to crosscut the Sandbank ledge. It is expected the ledge will be cut in 75 ft, and a rich body of ore opened up on the upper levels and at the worke on the surface.

DUDLEY.—At a distance of 200 ft from the shaft in the main west crosscut, 500 level, an immense flow of water was struck. An attempt was made to hold it, with the pumps running 200 strokes per minute. The water so gained that it was found necessary to abandon the 500 level, moving the pump 20 ft up the shaft. The water continued to gain, and the pump was moved up 20 ft more. The pump then broke, and it was taken to the surface for repairs. When it was placed back in the shaft, the water stood 95 ft above the station. Since then, with the pumps running 90 strokes per minute, a gradual gain has been made upon it, the water on Feb. 27th being but 40 ft above the 500 station floor. The head of the water has evidently been tapped, and it will be but a few days before work will be resumed in the 500 level.

MARYLAND CON.—The shaft has a depth of 500 ft, the bottom in clay and quartz, giving good assays. At 460 ft a fine ledge was cut, of good milling ore, four ft wide; at the 550 level a station will be opened and crosscuts started for the several ledges already cut in the shaft and upon levels.

HARRINGTON.—The winze in the tunnel has reached a depth of 105 ft; entire bottom in vein matter, and running through it are stringers of ribbon quartz, showing free gold.

NEVADA.

ALPHA.—Grass Valley *Union*, Feb. 29: The new shaft has reached 120 ft, at which point a new level will be opened. The ledge averages 18 inches in size, and shows well in free gold and coarse sulphurets. The rock gives every appearance of yielding a good return when a crushing is made.

ROCKY BAR.—A clean-up of 87 lotde of tribute rock yielded $3,007, or over $34 per load. This is fully up to the average of previous crushings.

DEADWOOD.—*Transcript*, Feb. 27: The Directors report that the main incline has been sunk 175 ft further, and a new level, which was started at a point 420 ft from the top of the incline, has been driven 300 ft during the past year. Good rock was obtained from the 320 level, which has been driven to a point 310 ft from the incline. Some 1,041 tons have been milled, yielding $20,991.32 net, or an average of $25.93 per ton, of which the sulphurets gave in value about 7½%. The mill cost over $10,000.

CUNNINGHAM.—Has been pumped by a party of New Yorkers and men put to work. A lawsuit will follow to dispossess them.

MURCHIE.—There has been reduced at the mill during the year 10,103 tons of ore, the average yield of which has been $12.31 per ton. The gross yield has been $124,420.04, of which $57,393.65 was free gold, and $67,026.39 from sulphurets. The amount of sulphurets saved has been 5.33⅓ of ore crushed.

MINING NOTES.—Grass Valley *Union*, Mar. 2: The Idaho has declared a regular monthly dividend for February of $1 per share, aggregating $3,100. This is the 127th regular dividend. The product of this mine for February is $23,700, an increase of $3,000 over January. The Godfrey gravel mill has again started up, after being kept idle for some time on account of the frozen ditches failing to give a supply of water. Forty miners are engaged in the mine in taking out gravel, which is run out through the tunnel and dumped directly at the mill. The Vulcan, adjoining the New York Hill on the west, is putting up steam hoisting works. The shaft on the mine has cut through two ledges, but when the steam pump starts up it will be sunk deeper to cut the under ledge, which is considered the richest. The incline of the Rocky Bar is being sunk for another level. It is 20 ft below the drain tunnel that tape the present lowest level. A crushing of rock from the Ford & McDonald, on New York hill, this week, will yield handsomely, as the rock is now richly in free gold. Work on the Bulldoser, on Osborn hill, will soon be resumed.

TULARE.

MINERAL KING.—*Times*, Feb. 28: A bar of bullion run from 18 pounds of rock weighed 11 pounds and 6 ounces and assayed upwards of $120 to the ton in silver, 70% lead, which, at the present price of lead, is equal to about $85 per ton. It came from the shaft which is down 16 ft. The drift shows a face of over two ft of solid ore, which will assay over $200 per ton.

NEVADA.

WASHOE DISTRICT.

OPHIR.—Gold Hill *News*, Mar. 3: On the 2100 level the ore body east of the Hardy vein prospects exceedingly well. The winze from this level, 40 ft south of the main east drift has a depth of 40 ft. On the 2200 level the north drift along the Hardy vein has a length of 125 ft. The south drift along the same vein has a total length of 124 ft. The north drift along the same vein, on the 2300 level, has a length of 138 ft. The joint Mexican crosscut on this level is in a heavy quartz. The highest assay obtained is $38. Length of crosscut, 100 ft. The main north drift on the 2500 level is in 70 ft from the incline. The main incline is 55 ft below the 2500 level.

BELCHER.—The winze from the 2760 level is down 22 ft. On the 3000 level the drift south has 50 ft to run to reach the parallel of the crosscut east on the 2760 level.

CALIFORNIA.—Crosscut No. 2, 850 level, is in 30 ft. The crosscut running west on the 1500 level is in 80 ft. From the east crosscut on the 2100 level, and 70 ft from the north drift, a raise has been started to prospect the ore vein on the 2000 level in the drift north. The main lateral drift south on the 2300 level has a total length of 180 ft.

UTAH.—The incline is down 200 ft on the slope below the 1750 level. The south drift on the 1750 level is in 185 ft and in vein porphyry.

YELLOW JACKET.—West crosscut, 2700 level, has been cutting ground which is getting softer and admitting of better progress. The north winze is 210 ft on the slope below the 2700 level.

HALE & NORCROSS.—Total depth of the winze, 165 ft. Breadth of vein is being disclosed on the 2200 level by the crosscut west, which has been extended 256 ft and has not reached the west wall yet.

JULIA CON.—The south lateral drift, 2000 level, has reached a length of 135 ft. The winze from the 1800 level is down 235 ft on the slope below that level.

SIERRA NEVADA.—The principal work is in the north drift, 2400 level, which is in 348 ft.

OVERMAN.—Crosscut No. 2 east, 1900 level, is 105 ft in length and is passing through a good-looking formation of porphyry, clay and quartz.

CROWN POINT.—The winze below the 2700 level, 120 ft on the slope. The joint Belcher crosscut east, 2700 level, is in 150 ft.

SAVAGE.—The incline has been pumped out. The drift for the incline from the 2400 level of the C. N. S. shaft is 450 ft in length.

ALTA AND BENTON.—The south drift, 1050 level, into Alta ground, is 315 ft in length, and that north into Benton ground, 448 ft in length, and both continue to skirt the vein.

UNION CON.—The shaft and east winze from the 2400 level are both being pushed for the 2500 level. The southeast drift, 2400 level, is 258 ft in length. The output of ore has been increased to 250 tons per day.

CHOLLAR.—The west drift has reached the point whence connection is to be made with the Hale & Norcross winze from the 2200 level of that mine and the connecting drift started. When the connection is made better ventilation will be secured. Fifty ft of quartz, yielding very fair assays, is in the west drift.

CON. VIRGINIA.—The stopes on the 1550 and 1750 levels are yielding an average of 145 tons of ore per day. The joint California east crosscut on the 2200 level is in 105 ft. The C & C shaft is 55 ft below the 2200 level, the bottom in vein matter.

GOULD & CURRY.—The raise from the 1700 level to meet the joint shaft is up 165 ft. The G. & C. and B. & B. shaft is down 927 ft.

BEST & BELCHER.—The east crosscut, 2000 level, joint with Con. Virginia, is in 150 ft east of the bottom of the winze.

MEXICAN.—The joint Union Con. crosscut, on the 2300 level, is in 120 ft.

CON. IMPERIAL.—The north drift, 2300 level, is now in 70 ft. The joint Alpha winze from the 2600 level is down 250 ft on the slope.

BELMONT DISTRICT.

BELMONT.—*Courier*, Feb. 21: The crosscut running west from 300 level is in the hardest slate ever found in the mine. The No. 3 raise was advanced through a vein of quartz showing milling ore.

SAN ANTONIO.—The crosscut on 450 level is in from foot of incline 82 ft, cutting through seams of quartz and low-grade ore.

EUREKA DISTRICT.

EUREKA CON.—*Sentinel*, Feb. 20: First level—Winze sunk 52 ft; drift bottom of winze in 12 ft. Third level—Northwest drift in 146 ft. Seventh level—Northeast drift in 152 ft; north drift in 128 ft; southeast drift in 103 ft; winze in 30 ft. Eighth level—Southeast drift in 150 ft. Ninth level—upraise 26 ft. Little teuth level—East drift in 169 ft. Tenth level—Drift en quartz ito in 37 ft. Eleveuth level—North drift in 840 ft.

HAMBURG.—Stringers of ore have been encountered and a vein 12 inches in thickness was struck at the depth of 792 ft that assayed $77 in lead.

RICHMOND CON.—The new chamber (No. 15) discovered on the 400 level, under the Tiptop ground, is opening well; a large body of good ore is exposed, and a connection in ore for the whole distance of 380 ft has been made between this chamber and No. 13 on the 600 level. The ore is still making up in the back of No. 15 chamber. In the bottom of No. 15 chamber there is a very fine breast of rich ore exposed, and all the other chambers are opening out well.

JETT DISTRICT.

JETT CON.—The Centennial shaft has a total depth of 60 ft. At a point 58 ft deep the footwall dropped from 40° to 70°, and the ledge changed its dip. The ore shows well in the bottom of the shaft.

WINNEMUCCA DISTRICT.

OHIO.—*Silver State*, Feb. 27: They have 130 ft drifts, and are sinking on the ledge in two places. One of the shafts is down 60 ft on the vein, which is 14 ft wide. The ore is rich, almost every seam in the quartz being thickly coated with horn silver.

ARIZONA.

MONITOR.—*Pima County Record*, Feb. 21: The prospect shaft is in solid ore assaying from $60 to $300. For over 1,000 ft bold croppings trace the course of the ledge, and have been cut in several places showing large bodies of ore worth from $100 to $1,000 per ton.

DOS CABEZAS ITEMS.—The Juniper gold mine has a shaft 80 ft in depth, all in good free milling ore, assaying up in the hundreds. About 80 tons of ore are now on the dump. The lowest of this lot will average $50. Adjoining the Juniper is the Madden, also gold, with a shaft of 60 ft, showing ore all the way. Next is the Greenhorn, which has two shafts sunk, having a depth of 10 ft each. The Bear Cave is one of the finest claims here, its shaft of 40 ft showing a magnificent body of ore. These are western extensions of the Juniper. The eastern extensions of the original location show equally good ore. These are the Murpby, the Pat Price, the McConnelly and MacOorrie. Still west of the Bear Cave, is the Silver Cave South, a ledge 100 ft in width.

SILVER DISTRICT.—Six miles northwest of Ewell springs is Silver district, where some 40 oddlocations have been made, among which are the El Dorado North and South. A union shaft on the two mines is down 80 ft, all in good ore.

EVANS ITEMS.—The Producer has a shaft 26 ft deep, showing 30 inches of black sulphurets and chloride ore assaying from $300 to $1,000. The main shaft of Conquest is down 24 ft, showing chlorides, sulphurets and native silver. On the Mountain View, 26 ft has been sunk; has four ft of ore running from $104 to $500.

GLOBE ITEMS.—*Silver Belt*, Feb. 21: On the Mexican the ledge is 36 ft wide at a depth of 106 ft. At the Seminole a new shaft is being sunk 260 ft west of the main shaft, and from the top down, ore of a very high grade is found. It is bird'e-eye porphyry, carrying chloride, sulphuret and malleable silver.

CENTRAL.—On the Central rich born and wire silver ore have been taken out. Twenty tone of ore on the dump averages $60 silver to the ton. The main shaft has been sunk to a depth of 50 ft and shows a good ore body.

MILWAUKEE.—A shaft on the Milwaukee has been sunk 25 ft and shows very fine ore.

NUGGET.—Messrs. Chilson & Drew have found an excellent ledge of silver ore 300 yards above the Nugget mill site. The shaft has been sunk 24 ft all in ore, which is of value to justify milling. An assay of the general average ore went over 00 ounces in silver per ton. The deeper it is sunk the more valuable becomes the ore. At present they are drifting, and the ore is of a high character. Seventy-eight pounds of nuggets taken out were worth from $4 to $3 per pound.

PILGRIM.—An 8 or 10-inch streak has been struck in the Pilgrim which runs as high as $700 and $800. The ledge is about five ft in width, and will mill, without assorting, about $100.

MINING ITEMS.—*Miner*, Feb. 27: Never within the last decade has the mining outlook for northern Arizona attained such a degree of brightness or prosperity as at present in regard to big strikes in quartz and placers. The Arizona Central (Vulture) is to have 100 stamps erected, and water furnished through iron piping from the Hassayampa, a distance of 12 miles. The Cavo creek mines are to have suitable machinery for their proper development. At Tiptop a good road has been made from mine to mill, the ledge opened so that a large quantity of ore can be secured with the services of a reduced force, and the prospects are exceedingly good for a bounteous yield of bullion. At the Tiger the shipments of silver go out by the thousand daily. In Bradshaw basin the 10-stamp mill of Messrs. Bowen, Knowles & Co., is ready to start up on Prince ore worth $400 to the ton. At the Peck the coming summer will see more bullion produced from the district than ever heretofore. The Black Warrior is showing fine bodies of ore. The Prince has been inspected by Prof. Raymond, and an increased number of miners put to work. On Turkey creek the Masterson and other mines are yielding very superior quality and quantities of ore. At Smithville the Mammoth shows, at 150 ft below the surface, from five to six ft of free milling gold ore. The mill is kept busy on this. In the Black hills the immense copper deposits show a most wonderful amount of ore. At Coyote Holes Gov. Powers has a large force of men developing a number of fair prospects. C. C. Bean is busy prospecting some of his gold, silver and copper lodes. The quartz mines, together with the placers of Lynx, Hassayampa, Antelope and Black Canyon creeks, have given mining matters an impetus hardly ever surpassed anywhere. With the additional stamps that are to be put up in this county within the next six months, about 150, the bullion product that follows will easily thribble that of any past period.

COLORADO.

TROPIC.—*Register-Call:* Ore yielding $500 in silver, gold and copper, per ton, has been uncovered in the main shaft at a depth of 200 ft.

MACK TUNNEL.—Work is progressing on this tunnel. North of the entrance, ex-Mayor Hartman has a force of miners at work in the east shaft of the Lucerne lode. The Lucerne company are developing their portion of that vein by means of a main shaft and crosscut.

HUKILL.—Has a four-ft vein of ore in the lower level of the shaft.

FREEMAN.—There are two veins in the bottom of the first shaft east of the discovery, and through which present explorations are made. The last lot of ore treated at the Boston & Colorado smelting works, yielded a trifle less than $90 per ton.

VIRGINIA CITY.—Georgetown *Courier*, Feb. 19: This mine is located on Bard creek, and has a mammoth lode of decomposed feldspar carrying chloride of silver. The body of milling ore is from six to ten ft in thickness, and assays from 40 to 800 ounces in silver, an average of over 100 assays being about 200 ounces per ton. A shaft has been sunk 65 ft, and a level is being driven from the bot-

Our Fresh Water Fishes.

[By W. N. Lockington.]

Comparison of the Fresh Water Fish Fauna of the Pacific States with that of the Rest of the United States.

The fresh water fish fauna of the Pacific States is in many respects remarkable, but more eo from the absence of types usually abundant in rivers and lakes than for the presence of any characteristic forms. In this respect it offers a marked contrast to the marine fish fauna, which contains a large numbcr of peculiar genera, and one family, the *Embiotoeidæ* or *viviparous* perch, which hae only one representative elsewhere.

In this compartive poverty of our fresh water fish fauna, we have at tbe same time an evidence and a result of the comparatively modern age, in a geological sense, of the entire coast. There bas not yet elapsed sufficient time for the evolution of highly specialized forms, and the migration of Eastern species, except as assisted by man, is almost precluded by the double barrier of mountains, with the intervening desert basin, that must be crossed by an invading form.

The total number of fishes mentioned in Prof. Jordan's "Catalogue of the Fishes of the Fresh Waters of North America," (1878) is 665. If from this we deduct about 40 species not occurring within the limits of the United States (excluding Alaska, as geographically outside), and about 106 speciee now believed to be doubtful or synonym, we shall have left 519 species. If to this we add the species mentioned in later writings of various naturalists, we ehall have a total of about 540 species, as an approximation to the number of forms occurring in the fresh waters of this country.

In this enumeration the Salmonidæ, Cyprinodontidæ and Gasterosteidæ or Sticklebacks are included, while the Gobiidæ, Belonidæ, etc., eome species of which ascend fresh waters from the sea, are excluded. Out of 12 Marsipobranchia, 5 lampreys and a hag or myxine occur on the Pacific coast.

Of the six or seven Acipenseridæ or Sturgeons, we have three or four; hut we have no *Polyodon* or Paddlefish, no *Lepidosteus* or Bony Pike, no *Amia* or Bow-fin, no *Anquilla* or Eel; and not a single representative of that large family of fishes, the Siluridæ, which includes the catfishes, horned-pouts, etc., of North America, and a very large proportion of the rich fish fauna of South America.

Twenty-nine species of this family are known to occur within the limits of the United States, and one of them, *Amiurus albidus*, a native of the streams from Pennsylvania to North Carolina, has lately been introduced by tbe State Fish Commissioners into California, and is thriving so well that it is already tolerably abundant in the market.

All the Siluridæ are tenacious of life, and can bear with impunity a lengthy deprivation of water. Some of the South American species, living in districts where the ponds and rivers are liable to dry up in eummer, are capahle of taking overland journeys in search of water.

I once purchased a small *Amiurus albidus*, apparently almost dead, wrapped it up in paper, kept it in my coat-pocket for four hours, and then found it alive. After a few minutes in a bucket of water it became quite lively.

Of the Catostomidæ or Suckers, so called from their usually thick lips and downward-directed mouth, about 56 species have been described as occurring in the United States, but of these only eight, including two species of *Chasmistes* lately noticed by Prof. Cope as occurring in Klamath lake, are credited to the Pacific coast.

This group is almost peculiar to North America, the only exceptions being a genus (*Myxocyprinus*) of one known species in China, and the *Catostomus rostratus* of Eastern Siberia.

The large family of the Cyprinidæ, including the various forms of carp, dace, chub, roach, minnows, etc., has, even after deducting all doubtful species, about 190 representatives in the United States, but of these only 24 or thereabouts are on record from the Pacific elope. Among these is the *Gila grandis*, the "Pike" of the markets, one of the largest of the family, attaining a length of four fest.

We have no fresh-water herring or moon-eyed herring *(Hyodon)*, and although at least four speciee of emelts *(Microstomatidæ)* occur in ealt water, it is not on record that any of them ascend the rivers.

In Salmonidæ, including the Microstomatidæ, our waters are especially rich, eince no less than six trout *(Salvelinus Salar), a Coregonus* or white fish, and five species of anadromous salmon *(Oncorhynchus),* occur in various parts of the Pacific region; making a total of 12 species out of about 27 found in the whole of Uncle Sam's domain.

The *Characinidæ*, a South American family, has a single outlier in Texas, but is not represented here; *Percopsis* is not found east of the Mississippi basin; the Esocidæ, or pikes and pickerels, oontine their voracity mainly to the same region, none of their eix or seven species reaching Pacifio etreame or lakes, except in Alaska; no epecies of the *Amblyopsidæ*, or blind fishes, or of the *Umbridæ*, or mud minnows, has yet heen found on this coast and even the large tribe of Cyprinodontidæ, or tootbed minnowe, of which about 35 good species are known to occur in tbe country, has but two representatives on our coast, and they extend only to the southern part of California.

The *Atherinidæ*, or silversides, have tbres species on the Eastern coast and at least two on the Westsrn, and though the Western ones do not figure in Jordan's check list, they ascend our larger rivers.

The only known species of *Aphododeridæ*, or pirate perches, is Eastern; so ie *Elassoma*, which eome make a family; and the Percoid euh-family, *Centrarchidæ*, affords our fresh waters only one out of a total of 51 valid species.

The four speciee of that division of the Percidæ, now known ae Labracidæ, are Eastern, as are the three true Percidæ. The Etheostomatoid division of the same good old family, although it has some fifty-six species in the United States, is not represented on this coast; no member of the *Sciænidæ*, so far as ie known, occurs in our fresh waters; and even the Cottidæ or bullheads give us only two or three out of fifteen or sixteen valid species.

We have no Gadoid or Chromid in our rivers, and three or four stickle-hacke (Gasterosteidæ) do not enrich us much in the way of food fishes.

Altogether, out of the total of about 540 recognized species, helonging to the families herein mentioned, only about 64 are yet known on the Pacific coast, taking that term as comprehending the region between the Sierra and the eea, exclusive of the great interior basin between the Sierra and the Rocky mountaine.

Among the more exclusively marine families, the Gohioid *(Gillichthys mirabilis)* is found in the mud of tidal creeks, and one or more of the species of Syngnathus have been taken in fresh water.

A Long-Neglected Mining Section Coming into Notoriety.

It bas been eome time eince Nevada witnessed within her borders a mining excitement of much importance. Next. to the Comstock, White Pine was the greateet we ever had. Since then there has been no particular rush to any section of the State. Eureka grew up on its own merits, without much ado, or capital, or outside help. Tuscarora, during the early days of the Grand Prize mine, drew together quite a community, as did also tbe discoveries in Paradise valley. Bodie got up a boom something after tbe old style, and took from ns a good deal of muscle and energy; but being just over the California line, it cannot he claimed to have besn a Nevada excitement. There is a section, however, within onr own borders, which is just now attracting a large ehare of public attention. We allude to the Columbus region in Esmeralda county. The Northern Belle was a dividend-paying mine for years, and we are told that there are several properties in the same neigbborhood which promise to he equally productive. Also, the Northern Belle has recovered its ledge at greater depth, and, it is said, is about entering upon a new era of prosperity. The Mount Diablo, Mount Potosi and Metallic are among the new minee which are just coming into prominence. The first named is claimed to have a million or two in sight. The prospects, all around, are spoken of as heing all that could he desired. Experts and mining men from San Francisco, the Comstock and Bodie are flocking to the new Dorado in great numbers. The principal town is Candelaria. Its population is ahout 400, and is daily growing. Several heavy mercantile firms are preparing to locate there. The conntry is one of the roughest and most desolate eections of the State; but being rich in the precious metals it is sure to draw. As things look at this distance, Candelaria is destined to furnish the next mining excitement in Nevada.—*Eureka Sentinel.*

The Mining Debris Question.—Tbe forthcoming report of the Public Land Commissioners, who visited California last autnmn, will contain the following interesting passage on the subject of mining debris: "The importance of the mining debris question is set forth in the testimony accompanying this report. It will appear therefrom that a eerious and increasing conflict exists in California upon this subject, between the miners and agriculturists. It would also seem to be a question falling within the legitimate scope of Congressional aotion. The United States still own 40% of the lands in that State, a large portion of which contain minerale. Facilities for running off their tailings are indispensable to the successful working of these mines, and the Government could ecarcely expect to sell the eame to purchasers and yet deny the necessary conveniences for their operation. But it is claimed that such unrestrained debris facilities destroy the agricultural lands on the lower portions of the streams, and that by the shoaling of rivers and bays navigation is being destroyed and commerce restricted. It should satisfactorily be determined whether these allegations are true, and if so, whether there is an appropriate or just remedy. This commission has enjoyed neither the requisites nor facilities for an intelligent solution of the important question, and it is clear that it falls within our jurisdiotion, hut it is closely allied to the future disposition of the public domain in mineral localities, and it is of such growing importance that we feel warranted in recommending the creation of a properly organized commission, clothed with authority to ascertain the faots and to propose to Congress an adequate remedy for any evils that may be found to exist, which shall settle this vexed question with even-handed justice to all parties concerned."

A Geological Curiosity in the Vicinity of Philadelphia.

The geological wonder known as the Ringing rocks, says the Reading (Pa.) *Times and Dispatch*, ars in Montgomsry county. Ringing hill, as the people there call ths eminence on which the celebrated rocks are found, is on the farm of Abraham Mensch, in Pottsgrove township, three miles northeast of Pottetown. The Ringing rocks cover a space of ahout three-quarters of an acre. In thie tract, boulders are piled upon boulders of all shapes and forms, and so promiscuously arranged that considerable agility is required to walk over them without falling. As one steps from rock to rock, a ringing sound, produced by the nails in the hoot-heels, is plainly heard. On tapping the stones with a hammer quite remarkahle acoustic properties are revealed. Some of them give forth a rich, full tone which would prohably vie with the best bell metal if the stones were fasbioned into hells. One of them in particular, from its depth of tone, is known as the State House bell. This was at one time among the largest of the rocks. It has been broken off, however, but etill has preserved its strong, full toue. The general sound produced by striking the smaller stonee resembles that of a blacksmith'e anvil, some having a littlo clearer ring than others, and no two sounding just alike. In passing from one to another of the larger rocks, one is reminded of the tapping of car wheels by the train inspectors.

We have not heard any satisfactory explanation of the cause of the ringing or bell-like sound of these rocke. Some say it ie owing to there heing a cavern under them. Thie, bowever, can have nothing to do with it, as when the rocks are removed they etill have the same sound. One large and sonorous boulder was taken to the Centennial, and attracted a great deal of attention there. Another was sent to England a year or two ago. There is prohahly a metallic eubstance in this group of boulders to whicb the ringing sound may be attributed. We havo not heard, however, of any geological analysis being made. Half a mile east of the Ringing rocks, and in the same range of hills, there is another group of bouldere which is much visited. Here a lofty pile of rocks surmounts a cavity of considerable depth, the whole being known as the Stone House. Near hy the Stone House is a huge boulder, some 15 or 20 feet high, which, from its peculiar contour, is called the Hay Stack. Besidcs their acoustic qualities, there is another singular circumstance about the Ringing rocks which visitors rarely fail to notice. Many of them have very strange marks or indentations. At some points these resemble the track of a horse's hoof. Others are like the track of a wagon. Some of the larger indentations are said to resemble an elephant's foot, and *fac similes* of the human foot are claimed to be found among the smaller ones.

Coinage.

The following is a statement of the coinage at the United States mints during the month of January, 1880:

GOLD COINAGE.

	Value.
Double-eagles	$1,360,000
Eagles	2,175,000
Half-eagles	3,532,500
Total gold pieces	$7,067,500

SILVER COINAGE.

	Value.
Dollars	$2,450,000

MINOR COINAGE.

Five cents	$300
Cents	58,200
Total minor coinage	$59,000
Total coinage	$9,576,500

How Indians Get Their Gold.—A Bodie *News* reporter noticed eeveral squaws panning out gold dust in emall pools of water formed by the damming up of the flow from the Standard mine. Some of them were quite expert, handling the pan like an old gnlch miner. One of the squaws finished washing out a pan of dirt while the reporter was present. A emall quantity of very fine gold, mixed with sand, remained in tbe pan after the dirt had been washed off. From eome hiding place in her tatters she took out a piece of buckskin with a emall amount of gold and black sand tied up in it. This she untied, placed in it the dust ehe had just panned out, and returned it to its former hiding place among her rags. Looking around to see where the dirt came from, several Indian braves and hoys were observed digging and scratching in the old dumps lying near by. The braves get the dirt and the squawe do the panning out.

Among its many objects of historical interest, the Paris Astronomical Museum contains a pair of Mercator'e glohes, dating from the middle of the sixteenth century. That figuring the earth is the first on which meridiane of longitude and latitude were laid down. It is reported that the great eqnatorial lakes of Africa are all to be found on it.

New District.—Inyo county has always great attraction to old mining adventurers. The ores are very rich and intractable. Just now there ie a new excitement. A new district has been formed under the name of Breyfogle, at a point about 20 miles north of Panamint, in the same range. It is well supplied with wood, water and grass.—*Esmeralda Herald.*

Glimpses of the Rocky Town of Penryn.

Tbe town of Penryn, Placer county, is prettily located on a slops of the foothills, and commands a fine visw of the undsrlying valss and hillocks stretching away toward the vast expanse of the Sacramento valley. Sunset as seen from the village on the day I was tbere, was one of the prettiest sights imaginable, the last rays hreaking through a fleecy cloud and lighting up the cliffe and little valleye in a manner to present the rock, trees and many-hued foliage in the most striking contrast poseible. Although the town is populated by workers—men who delve in the granite quarries (the principal industry of the place)—it would seem to he a delightful locality in which to while away the daye in peace and quiet, and to study the beauties of nature.

There are many small valleys in the vicinity of the town, in which are snug-looking, psaceful homes, with the stoutest, rosiest and healthiest looking children ecampering ahout. In fact, it appears as if such a thing as sickness is unknown there. The rain keeps the place washed and free from all dirt and filth, while the gravelly, quartz-like formation of the hillsides prevente the accumulation of mud.

In the neighborhood are several promising quartz ledges, while one citizen is prospecting what he helieves to be ono of the finest iron mines on the continent. A company of Chicago capitalists recently purchased the Schnabel mine and mill, located between Penryn and Newcastle, and are now working it. The price paid wae some $200,000.

Vine culture is getting to be a prominent industry ahout there, and bids fair to assume considerable proportions within a few years.

The people of Penryn do not look with much favor on the Folsom branch prison, as they fear that the State may be ahle, by the aid of cheap labor, to greatly interfere with the business of individuals engaged in granite quarrying, if, indeed, the effect should not he to drive the latter from the market entirely. This is a matter of no little concern to such towns as Rocklin and Penryn, which are kept up by their granite industries. The Penryn quarries are among the most extensive on the coast and the quality of the rock is unexcelled. At the present time there is a fair force employed under the superintendency of Mr. Griffith, who has recently erected a large and heautiful building, which is used hy him as a etore. Tbe building would attract attention in any city.

Large quantities of stove-wood are shipped from Penryn to Sacramento, embracing live, black and white oak, pine, etc. Excellent wood is delivered at the station for from $4 to $4.50 per cord.

There is an excellent public school in the village, and there is a sufficient number of pupils to warrant the employment of two teachers. —*Cor. Sacramento Bee.*

A Rival Project to the Simplon Tunnel.

As a rival project to the Simplon tunnel, the tunneling of Mont Blanc is proposed as an alternative which possesses several decided advantages over the Simplon route, which was thought to furnish the best practical routo from Paris to Brindisi, by way of Pontaclier and Lausanne. The new project is pronounced to he entirely feasible hy Frenob engineers who have proposed it, and ie said to be receiving favorable consideration. Contrary to general opinion on the snhject, the tunneling of Mont Blanc is declared to he an easier undertaking than that of the Simplon; the estimates of cost for executing the work heing, in the case of the Simplon, 136,000,000 francs, and in the case of Mont Blanc only 75,000,000. Furthermore, it is claimed that the Mont Blanc tunnel will make the journey from Paris to Genoa 97 kilometers shorter, and from Paris to Milan, 44 kilometers shorter than by the proposed Simplon route. The location of the tunnel, which meets with favor from its advocates, is said to be from Chamounix to Courmayeur. Our authority does not go into further details; but the project has met with eome remonstrance on sentimental grounds. We reproduce the following affecting linee, which vividly recall the picture of Mark Twain weeping over the grave of Adam: "The audacity of modern engineering has culminated in a projected attempt on Mont Blanc. It is bad enough that the once virgin eummit should be annually defiled by cockney feet; but that the awful mysteries of its rocky foundation should be invaded by ewarms of rude 'navvies' is past belief, yet it is eeriously contemplated."

A recent course of experiments made to determine the heating power of gas showe that one cubic foot of ordinary 16-candle coal gas will develop 318 heat units, while water gas will give only abont 136.6 heat units per cubic foot.

A Maryland genius has invented a flexible lining for kerosene lamps, which, it ie claimed, greatly diminishes danger in case of breakage, and renders the lamp less liable to explosion.

If the work of exploring and development had been pushed in the Marquette iron district, the region by this time would he in a position to produce at least 2,000,000 tons of ore.

Australia has supplied England, during the last five years, with $131,738,000 in gold coin and bullion.

Copper Industry of the United States.

We have received the following from Messrs. F. W. Heyne & Bro.:

STATEMENT OF THE STOCK, PRODUCT, CONSUMPTION AND EXPORT OF COPPER IN 1879.

Stock, January 1st, 1879, estimated.....	17,000,000 lbs.	
Product, at Lake Superior.....	40,000,000 "	
" at Baltimore, North Carolina, Vermont Smelting Works.....	6,000,000 "	
Total.....	63,000,000 "	
Consumption, averaging 3,500,000 lbs. per month.....	42,000,000 lbs.	
Export.....	13,500,000 lbs.	
Returned.....	2,500,000 "	
	11,000,000 "	
	53,000,000 "	
Stock, December 31, 1879.....	10,000,000 "	

There being no control in regard to stock and consumption, it is difficult to form an estimate with any degree of certainty. From January 1st to end of May, 6,000,000 lbs. were exported from the old stock, at least 9,000,000 lbs. went into consumption, and about 2,000,000 lbs. were left in the hands of speculators; the stock on January 1, 1879, could, therefore, not have been less than 17,000,000 lbs.

The consumption has been very large during the last four months of 1879, and is estimated to have been about 5,000,000 lbs. per month; an average of 3,500,000 lbs. per month is, therefore, not too high.

Taking the consumption for the next five months, January to May inclusive, at 4,000,000 lbs. per month would amount to		20,000,000 lbs.
We have against that:		
Stock, January 1, 1880.....	10,000,000 lbs.	
Receipts, per rail, from Lake Superior.....	4,500,000 "	
Receipts from Baltimore, North Carolina, Vermont, etc., Smelting Works.....	2,500,000 "	
	17,000,000 "	
To be provided for by importation from England.....	3,000,000 "	

Astoria Coals.

The Washington correspondent of the *Standard* says: Mr. Hare, of Astoria, is still here and is doing good work in the interest of tin rebate bill. The specimen of coal he brought from Clatsop county was recently analyzed, as the following letter explains:

SMITHSONIAN INSTITUTE,
WASHINGTON, D. C., January 26, 1880.

Senator Slater, U. S. Senate Chamber, Washington, D. C.—DEAR SIR: The coal from Oregon, which you submitted for examination, has been analyzed by our mineralogist. He has made a quantitative examination upon his own responsibility, which is, as you know, not furnished by the Institute. He reports as follows: Water given off at 212 degrees Fahrenheit, 2.56%; volatile and combustible, 47.29%; fixed carbon (coke), 48.49%; ash (reddish brown), 2.74%.

Very truly yours,
SPENCER BAIRD, Sec.

Referring to the above, we give the following comparative list of other coals, showing the superior quality of Astoria coals:

Comparative Analysis.

	Astoria coals.	Coos Bay.	Nanaimo.	Bellingham Bay.
Water.....	2.56	20.00	2.98	3.39
Volatile combustibles..	46.29	32.59	32.16	33.26
Fixed carbon coke....	48.49	41.98	46.31	45.69
Ash.....	2.74	5.34	18.55	12.66

This is a very important matter, and establishes the fact that in future references to the Astoria coals we are justified in referring to them by their right name, "coals of the very best quality." This ought to be sufficient to stimulate Astorians to the work of speedily beginning the construction of our railroad, at least to the coal fields.

CEMENTS FOR IRON WORKS.—It is sometimes advisable to fix two pieces of iron, as pipes for water or steam, firmly together, as a permanency. A rust cement is frequently used, and the materials are sal ammoniac, sulphur and iron borings. If the cement is desired to act quickly, the proportions should be: Sal ammoniac, 1 part by weight; sulphur, 2 parts; iron borings, 80 parts. If plenty of time can be allowed for setting, make the proportions: Sal ammoniac, 2 parts; sulphur, 1 part; iron borings, 200 parts. The sal ammoniac and sulphur should be pulverized, and the borings of iron tolerably fine and free from oil. The mixture should be made with water to a conveniently handled paste. The theory of its action is simply union by oxidation.

THE amount of silver coin in Holland is estimated at 144,000,000 florins, or about $60,000,000, of which there were recently about 75,000,000 florins in the Netherlands Bank. The gold circulation, inclusive of the bank's reserve, is estimated at 50,000,000 florins, or about $21,000,000.

THE *Japan Herald* reports that the coinage of silver at the mint at Osaka is going on, such is the demand, at the daily rate of 30,000 pieces, and 1,000,000 monthly, with a demand greater than the mint with its present capacity can supply.

ENGLAND, during the five years just ended, imported silver to the value of $331,553,000, and exported it to the value of $349,671,000—being an excess of $18,118,000 of exports of silver over imports.

THE first gold mine in the United States was discovered in South Carolina in 1790.

USEFUL INFORMATION.

The Origin of Bog Iron Ore.

The roots of trees appear to have power to reduce the peroxide of iron, contained in sands with which they come in contact, to the soluble protoxide. When the water which dissolves this runs into low places, where branches, twigs and leaves of trees are slowly decaying, the protoxide becomes reoxized and is deposited in the interstices of the vegetable forms left by the decomposition of the woody fiber. Thus, parts of the trees are not petrified, but ferrified; the whole beds of iron ore consist of these roots of dead vegetation. Where the ferruginous waters do not encounter masses of decomposing wood, but merely lie at rest, as in swamps and ponds, the evaporation causes the ore to be deposited in lumps, from the size of a shot to 500 pounds weight. From the bottom of ponds these lumps can be raised with tongs, like oysters. In either form the large amount of vegetable matter which this ore contains makes the melted iron reduced from it exceedingly fluid, so that it runs into every nook and cranny of the casting mold, and reproduces it with sharp and precise outlines. When bog ores can be procured to mix with other iron ores, they produce a highly beneficial effect in the running of the furnace and quality of metal turned out; though, as a rule, they will not yield 40% of metal. The pig metal obtained from them is so brittle that it breaks to pieces on being dropped on hard ground. Its weakness is in part due to its containing phosphorus, arsenic, etc. When taken from swamps, the workmen often throw into the cavities loose earth, leaves, bushes, etc., which, often within eight years, leave behind them fresh deposits of ore. The most noted places of supply for bog ore in this country are: Monmouth county, New Jersey. Piscataquis county, Main and Snowhill, on the eastern shore of Maryland. In the early part of the century much was obtained from the ponds of Plymouth county, Mass., and from Egg Harbor, New Jersey.

A NEW varnish for protecting metallic surfaces, especially that of iron, is believed to have been found in the application of euphorbium gum. The history of this suggestion is stated to be as follows: The workmen of Natal are said to have noticed that when they cut certain plants of the *euphorbeaceæ*, a thin, adherent layer of gum remained upon them which effectually protected the blade from rusting. To determine the extent to which this protective influence could be relied upon, the experiment was tried of coating sheet iron with the gum and immersing it in the sea water of South Africa, which is highly detrimental in its action upon iron. The trial is affirmed to have proved so successful that a varnish was made of the gum dissolved in spirits, and this was applied to ships' bottoms and to other metallic surfaces. The adherence of the gum after the evaporation of the spirits is said to be perfect. A ten-years' trial of this preparation at the Chatham dockyard, in England, is reported to have given equally satisfactory results, the iron so varnished having remained uninjured after exposure, during that period, to the corrosive action of the water of the docks. In Africa, where the gum is abundant, it is said to have long been in use as a preventive of the ravages of the white ants. Its virtues are ascribed to its perfect insolubility in water, and to its poisonous qualities and extreme bitterness, which make it an excellent protective agent against the lower forms of marine and terrestrial life.

THE COMING WAR SHIP.—Prof. Læwenthal, a German, thinks that the coming war ship will be made of India rubber. His idea is to make the entire hull of rubber one foot in thickness, strengthened below the water line by a light steel frame. The vessel will be driven by an ordinary steam engine, and will have no masts. At the bow will be a projecting spar, to which torpedoes will be affixed, and the entire crew, including the helmsman, will be on the lower deck out of the range of shot. When a cannon ball strikes the India-rubber ship, it will pass directly through it above the heads of the crew, and the hole made by it will instantly close. Paying no attention to such futile attacks, the India-rubber vessel will steam toward her adversary and explode her torpedo. The doomed vessel will instantly sink, while her elastic destroyer will be driven hundreds of yards backward by the recoil following the explosion. Such a vessel, says the inventor, could destroy all the navies of the world, and after her work was done she could be made as strong as ever with the aid of two or three bottles of cement.

THE LARGEST OF LAND ANIMALS.—In the *American Journal of Science and Arts*, Prof. Marsh describes the largest land animal yet known to have existed on the globe. Its name is *Atlantosaurus immanis*. The thigh bone of this creature is over 8 feet long, with a thickness at the larger end of 25 inches, though the bone has no true head. A comparison of this bone with the femur of a crocodile would indicate that the fossil saurian, if of similar proportions, had a total length of 115 feet. That the reptile was 100 feet long when alive is at least probable. The other bones of this animal that have been found are proportionately gigantic; caudal vertebra has a transverse diameter of more than 16 inches. All the bones of this reptile yet discovered are in the Yale College museum. They are from the Upper Jurassic of Colorado.

A SIMPLE FORM OF AUDIPHONE.—A gentleman formerly connected with the Philadelphia *Ledger* is reported to have discovered a simple form of audiphone, which he has tried with satisfactory results, although he is very hard of hearing. A few days ago he was explaining the principle of the audiphone to some friends, and to illustrate his remarks, put a folded newspaper between his teeth, bending it over in the form of the audiphone. To his surprise he found that he could hear as well with the newspaper as with the audiphone. He subsequently attended an auction sale, and putting the catalogue between his teeth, and bending it down with one hand, heard all that was said, although without some such contrivance he could hear nothing. The experiment is a very simple one, well worth trying by all who are hard of hearing. Newspapers, pamphlets, card boards, oven sheets of writing paper seem to serve the purpose as well as the hard rubber audiphone.

TEMPERING THE POINTS OF TOOLS.—After being tempered the volume of the tool is slightly increased, and consequently its specific gravity is decreased. As the expansion or increase of volume is so very slight, it is quite immaterial which is plunged into the liquid first; however, every moment the edge is kept out it is cooling, and the tempering may be rendered defective thereby. Mercury tempers the hardest, then water, then salt and water, then oil of various kinds—as whale oil. As oil cools the metal more slowly, it is not tempered so hard, but the tenacity is increased.

WOOD CARVING is an industry which is carried to considerable perfection among the Germans, and it is fostered by the establishment of carving schools, particularly in districts where the wood used for the work—the Spanish walnut, the finest and best walnut the Germans have—is plentiful. Eighty of these carving schools exist at the present time in Germany, and 80 in Wurtemburg; but so much importance is attached to the results, which have flowed or are expected to flow, from these institutions, that the number of the carving schools in Germany is to be increased to 200.

COLLECTION OF ORNAMENTS.—A New York firm, Palm & Fechter, have a collection of over 1,000 designs—crests, coats-of-arms, vignettes, scrolls, corner pieces, borders, etc.—suitable for painters, decorators, engravers, lithographers, metal workers, wood carvers, and others having use for such ornaments.

GOOD HEALTH.

Bare Brick Walls—Their Influence on Health.

The New York *Times* of January 14th has the following: "At the meeting of the Board of Health yesterday, a report was received from Dr. E. H. Janes, Assistant Sanitary Superintendent, in relation to an inspection of the recent additions to the new court-house. Dr. Janes says: 'I found that the interior walls consist of brick uncovered by plastor or paint, and thereby present an absorbing and evaporating surface, which, in my opinion, is detrimental to the health of those who daily occupy these apartments. From its porous quality, brick readily absorbs not only air and moisture from the ground and atmosphere, but animal vapors and impurities constantly escaping from the lungs and skin of those confined between brick walls are also absorbed and exhaled in turn with the regular changes and purifications of the in-door atmosphere.

"'I am aware that the experiments of Pettenkofer are cited as an argument in favor of bare brick walls, on the ground that air readily passes through them. But persons holding these views forget that animal impurities do not possess the diffusible power of gaseous bodies, but, on the other hand, adhere to porous structures; and while it may be claimed that foul air will, to some extent, escape through the brick walls from an unventilated apartment, the fact remains that air in finding its way through the wall leaves most of its foulness behind. Bricks so exposed become in time exceedingly filthy, and cannot be thoroughly cleaned by any amount of scrubbing. I would therefore recommend that the interior walls of these rooms be covered with some material that will prevent the absorption and subsequent exhalation of moisture and atmospheric impurities.' The report of Dr. Janes was transmitted to the Surrogate, whose clerks occupy the rooms referred to in the document."

Neglect of the Eye.

Whatever an ounce of prevention may be to other members of the body, it certainly is worth many pounds of cure to the eye. Like a chronometer watch this delicate organ will stand any amount of use, not to say abuse; but when once thrown off its balance, it very rarely can be brought back to its original perfection of action, or, if it is, it becomes ever after liable to a return of disability of function or the seat of actual disease. One would have supposed from this fact, and from the fact that modern civilization has imposed upon the eye an ever-increasing amount of strain, both as to the actual quantity of work done and the constantly increasing brilliancy and duration of the illumination under which it is performed, that the greatest pains would have been exercised in maintaining the organ in a condition of health, and the greatest care and solicitude used in its treatment when diseased. And yet it is safe to say that there is no organ in the body the welfare of which is so persistently neglected as the eye.

I have known fond and doting mothers take their children of four and five years of age to have their first teeth filled, instead of having them extracted, so that the jaw might not suffer in its due development and become in later years contracted, while the eye, the most intellectual, the most apprehensive, and the most discriminating of all organs, receives not even a passing thought, much less an examination. It never seems to occur to the parents that the principal agent in a child's education is the eye; that though it gains not only in sense of the methods and ways of existence of others, but even the means for the maintenance of its own; nor does it occur to the parents for an instant that many of the mental as well as bodily attributes of a growing child are fashioned, even if they are not created, by the condition of the eye alone.

A child is put to school without the slightest inquiry on the part of the parent, and much less on the part of the teacher, whether it has the normal amount of sight; whether it sees objects sharply and well-defined, or indistinctly and distorted; whether it be near-sighted or far-sighted; whether it sees with one or two eyes; or, finally, if it does see clearly and distinctly, whether it is not using a quantity of nervous force sufficient after a time not only to exhaust the energy of the visual organ, but of the nervous system at large.—*Dr. Edward G. Loring.*

INVERSION OF THE BODY IN CHLOROFORM ASPHYXIA.—Dr. Sporer describes an interesting case of this treatment in a recent St. Petersburg journal. A leading English medical weekly refers to it as a "novel treatment," but the value of inversion of the body in such cases was demonstrated long ago, though many physicians may not be aware of the fact. The case in question was that of a boy 11 years of age, in whose ear a pea bad become embedded. After numerous trials to remove it, from 30 to 35 drops of chloroform were inhaled from a handkerchief in order to relieve the great pain which these trials caused, and the body was then easily removed. But scarcely had the inhalation ceased when the boy's pulse entirely failed, and he gave every sign of approaching death. Efforts of restoration of the usual kind were tried in vain for more than 20 minutes. His head and the upper part of the body were then thrust out of the window to try the effect of the cool September air; but as no effect was produced, one of the assistants seized hold of the boy by the legs and hung him out of the window with his head downwards, swinging him to and fro like a pendulum. After four or five minutes of this procedure the boy's death-like face became reddened, and to the joy of all present he uttered a cry. The respiration and circulation were restored after more than half an hour's arrest. Dr. Sporer does not believe the recovery was due to the mere exposure to the air, but rather to the inverted position of the body inducing a passive congestion of the anæmic brain, and thus giving an impulse to the action of the heart.

DEATH FROM AN ELECTRIC SHOCK.—An accident of an extraordinary nature occurred on Tuesday night, Jan. 17, 1879, at the Holte theater, Aston, a suburb of Birmingham. The stage is lighted by two electric lights, and when the candles are not burning the connections used for the purpose of crossing the current are hung up over the orchestra. After the performance of the pantomine, Mr. Bruno, the euphonium player, was leaving with the other members of the band, when, presumably out of curiosity, he caught hold of the two brass connections referred to; the man in charge called out to him with the object of warning him of the danger he was incurring. The warning, however, came too late; Mr. Bruno received the full shock of the electric current, generated by a powerful battery which supplies the whole of the lamps in the building and grounds. It is said that the candles not being then burning, Mr. Bruno was unable to disengage himself, and pulled the wire down. The shock rendered him insensible. A medical man was at once sent for, and restoratives were applied, but Mr. Bruno died in about 40 minutes afterwards.—*The Electrician.*

CALOMEL IN TOMATOES.—An old subscriber and friend writes us that a celebrated French chemist and physician, who has analyzed tomatoes declares that they contain all the elements of calomel, and he has known them to salivate persons. She wishes our opinion on this subject, and we have only to say that this idea has been going the rounds of the press for more than 30 years. It is a falsehood from beginning to end. The idea that they produce salivation may possibly have originated from the fact that, eaten in large quantities by some persons, the acid of the fruit seems to irritate those parts of the mouth with which it comes in contact. The idea that tomatoes cause cancer, is another superstition, the outgrowth of the former notion that tomatoes were unfit to eat. They cause neither cancer nor salivation, and may be eaten with impunity by most persons, and often with great benefit.—*Herald of Health.*

The Week.

The widely extended rains of the past few daye bave brougbt comfort to tbc agriculturists of tbe State and expcotations to all of good crops for the coming year. Tbe late rains in tbe valleye and late snows in the mountains are welcome alikc to farmer and miner.

No news of a etartling nature concerning mining operations has been given us for some time. Still, developments quietly go on, tbe results of which are of the future more tban the present. Mining stocks are still dull and inactive, the only news of note being tbe transfer of Mr. Flood's miuing interests in tbe Comstock to Mr. Mackay. A year or two ago such a transaction would bave bad a great and visible effect on the market, but now it is hardly heeded. The brokers continue to leave for New York to seek new fields for their labors. The Chinese have also gone Eastward of late, and already the dispatches tell us of their appearance in New York, and of the efforts to prevent their estahlishing a "Cbina Town" in that city.

The daily processions of tbe unemployed in tbie city have stopped, and measures are being taken by wealthy citizens to provide work for all those wbo really want it. Times are still dull, however, and there is very little building going on. It is boped that business will begin to improve before long, hut it is hardly prohable it will until after the adjournment of the Legislature. So many ahsurd and frivolous bills have been, and are being introduced, that capital does not know where it stands; and this state of uncertainty bas of course a tendency to binder the commencement of new entsrprises or tbe greater development of old ones.

Tbe legislative action of the past week ie fully referred to in another column.

HARTMANN, arrested in Paris for tbe attempt nn tbe Czar'e life at Moscow, has confessed that he was engaged in tbe affair.

THE Lone We Tong Eng Ti Association (United Brotherhood of Masons) has heen incorporated in New York.

A State Mineralogist.

In the last numher of the PRESS we gave tbe full text of Mr. Wasson's hill providing for the sstablishment of a Miniug Bureau at San Francisco. This hill has heen favorahly reported on hy the Assembly Committee on Mines and Mining. While complimenting Mr. Wasson on his dsvotion to the mining industry, we are afraid his hill as it stands at present is trying to do too much.

In the first place the clause making it the duty of the State Mineralogist to make such analytical assays as are required, of the specimens collected, would not operate well. He could not make assays for private individuals, of course, since that would hring him into conpetition with people already making a living out of that husiness; and making assays of specimens sent would amount to this.

It is very douhtful if any good will result from the State forming a collection of minerals in San Francisco and another one in Berkeley. The ostensihle objects of each would he identical, and hoth would have to appeal with exactly the same arguments to exactly the same public. The University collection now increases more slowly than is pleasant. It is, of course, important, in this new country, to keep our scientific interests as "unified" as possihle, since it is only in that way that any desirable result can he accomplished.

The Geological Society are doing good work now in collecting specimens, and these they will at some future time turn over to the State. No douht they will do it now if the State Mineralogist is appointed. But this collection is to he kept in San Francisco. There are many who consider that the collection at Berkeley is of little use since it is out of the metropolis, and at a place where it cannot he conveniently examined. Thie is true enough in some part, but people interested sufficiently to examine specimens sbould not mind the trip to the University. A collection in the city would he a very good thing if it did not interfere with that in which such good progress has heen made already at Berkeley.

As we understand the Wasson hill, however, it is not only a mineral collection he is after. A collection of minerals is not all we want. In fact nine working miners out of ten wouldn't kuow much ahout it when they saw it; and half of them would never even go to see it. It seems as if the main idea of most people when they start in to instruct a mining community is to make a collection of minerals. It is all very well in its way aud serves its purpose, hut it does not serve the purpose most needed. It is more useful at a University than anywhere else, since the specimens are used in instruction and for purposes of comparison.

The third paragraph of Mr. Wasson's hill aims more directly at what we conceive is needed. The mining community want an official, paid by the State, whose duty it is to give them information on certain subjects; information which will bs of *practical value* in their daily work. Wben a man finds a certain deposit, and on inquiry be is told that it is a cartain substance, be wants to know something ahout tbe substance; bow it is worked; what it is wortb; bow it is to be treated, etc. The fact that its true and correct mineralogical name is told him is of no practical value to him. He don't care quite as mucb whether it is named rightly or not, as be does to know wbether it is wortb anything.

Mr. Wasson'e bill provides for the maintenance of a library of mining and metallurgical hooks of reference. *That* the Free Library will do for us. A collection of models of mining and metallurgical appliances also provided for, would he a good thing.

What the miners want is some one who will answer their questions, whicb tbey have no opportunity of solving or bunting up themselves. A miner, for instance, sends down a piece of "rock" to know what it is. Writing back to him and telling bim the mineralogical term for the substance he sent, is by no means all he wants. If it is of economic value, be wants to know it. Wants to know if it is wortb anything, and bow mucb; how to go to work to prepare it for market, etc. Perhaps a dozen men in one part of State are at work on tbe same substance, but he does not know it. He would like a small circular sent to him telling him all ahout tbe euhstance, in terms which will he of use to bim.

The writer bas had, in editorial experience in this papsr for eome nine years, ahundant opportunity to know tbe kind of information the miners want. Dozens of letters are anewered every week of the character referred to. There are not so many different substances obtained from mines in this State that a small circular concerning sncb of tbem as are of economic value which could not readily he compiled and sent in answer to eucb queries. This idea could be broadened to any desirable extent, so as to give information about metallurgical processes, etc. Information of a similar character is availahle to agriculturists; wby not to miners? It need not interfere witb the business of mining engineers or assayers. All that can he properly arranged.

It may seem to some tbat this idea is Utopian, hnt to ue it does not appear so. Information is wanted wbich will eventually result in public good, and tbere sbould be a source from wbicb it may be drawn. If the matter ie put in the hands of some compstent person at the University, or some one in this city, it would he carried out with satisfaction.

A State Mineralogist, in the ordinary acceptation of the tarm, collects and identifies minerals. We do not want a man simply to do that. It was tried in Nevada, hut the trial was a failure and accomplished no hensficial result. If the University can provide for the wants of the miners in ths manuer spscified, hy all means let it do so, and do not multiply offices to the injury of all. Mr. A. W. Jackson, Minsralogist of ths University, will no douht bear witness that he has many questions liks thosc referred to brought to him eacb week, and will acknowlsdge the wants the minsrs have in that direction. He is working hard to make ths collection of minerals complets there, as we well know. Still we consider that Mr. Wasson's hill, in its third section, provides for some things whicb the University, witb its present facilities, does not offer to the mining puhlic.

Academy of Sciences.

Tbe regular monthly meeting of the California Academy of Sciences was held on Monday evening last.

B. B. Redding, California Fish Commissioner, donated a land-locked real ealmon, caught in Winnemucca lake, the result of eggs placed in the Truckee river four years ago, whicb was done hy the expenditure of $1,000, given hy Governor Stanford and Charles Crocker for that purpose.

Donations to the library included "Annale of Harvard Astronomical Ohservatory" from Dr. Pickering, "Rhizopods of North America" from Joseph Leidy, and volume one of a new German geograpbical magazine.

Prof. Jordan of the United States Fisb Commission, who is on this coast in the interest of the Government, was invited to address the Association. He said that the lahors of himself and associates havo, as yet, heen principally confined to the waters af San Diego, San Pedro and Santa Barhara. Among the specimene of fish examined were the European shark, of which little has heen heard on this coast, hut it is taken hy thousands in Los Augeles waters for the oil. Mr. Jordan here exhibited a specimen of the true sole, the only one yet found on the Pacific coast. Tho fish sold in our markets as soles are different kinde of flounders. The one shown was picked up in the Chinatown of Los Angeles. Of the flounders, two new species have heen found. One was caught just outside the Golden Gate, and is evidently the young of a species that grows to a large size. The only other specimens of the species known were found in Greenland. Another flounder was of the halihut form. Otber new forms were found of the sting ray. It was found off San Diego, and is of the Europeau genus. Another ray, caught off Santa Barhara, helongs to the Chinese genus. This is only another evidence that fishes of tbe same genera are common to both sides of the Pacific, and as the speaker facetiously remarked, "forming another link hetween California and China." It ie almost as easy, said Mr. Jordau, to find new genera as new speciee on this coast. Several sharks, about three feet long, were found off Santa Barbara, which bave the peculiar faculty of inflating themselves with air when caught, until they are two-thirds as hroad as they are long. This has only heen known hefore hy specimens brought fiom Van Dieman's Land. To the 11 epecies of rock cod, seven more have heen added. Most of the new spécics are of a bright red color. Another new species of surf-fish or percb was found in the San Francisco market.

In conclusion, Mr. Jordan said he and his party would remain in San Francisco ahout two months, then take np a situation at Monterey and Santa Cruz, tben at Tomales bay, tben Puget eound, and tben go to the moutb of the Columbia.

Professor Stillman read a very ahle and interesting paper, carefully prepared, on the gum and coloring matter fouud on the *Acacia Creggi* and the *Larrea Mexicana*, or creosote plant. The gum which exudes from and surrounds its branches is very ahundant, and is the product known to commerce as shellac, of which sealing wax and varnish is made, also lac-dye, a brilliant scarlet dye so popular in England, and used for dyeing hright red military coats. He expressed a belief that if California can compete with British India in the production of this one article, it will give employment to all our idle hands. It is a most valuable commercial product. B. B. Redding said it extended in unlimited supply, as plenty as sage-hrush, from southern Utah to New Mexico, and from the Colorado desert to western Texas. It is most abundant around stations on the Mojave and Colorado deserts, and exudes as the result of an insect'e sting. Calcutta exports a million pounds sterling in value annually of sbellac, selling at 25@35 cents a pound, and almost as much more of lac-dye, selling at 30@40 cents a pound. In 1876, the United States imported 700,000 pounds of shellac alone. To collect this, is simple work for hoys, and will prove an important industry. It will require little or no capital. The twigs are hoiled in hot water and the gum rises to tbe top, is skimmed off, strained and dried on smooth etones, and hand-pressed into flakes, ready to make ssaling wax or varnish. The residus, when allowed to settle, makes lac-dye. The plants live on s rainfall of three inches a year. It is found in all parts of Arizona, and well dsmands the attention of commercial men.

The Ferguson Mine, Mariposa County.

We referrsd soms months ago to the way in which this mine was heing opeued out and worked, as an exampls of trus economy in mining, and indicatsd our conviction that the owners would at an early day hegin to reap ths results of their patient lahors. Thsse anticipations have already hsgun to he fulfilled; the first dividend was declared last month, and from the extensive reserves now opened up in the mine, continuous dividende for some time to come appear to he assured.

The two principal hodiee of ore, over 400 feet long, which, in the main level, are divided hy 200 feet of harren ground, in the bottom level, 200 feet helow the main level, have only 60 feet of unprofitable ground hetween them. This 200-foot level is now over 600 feet in length, the whole distance, with the exception of thie epaco of 60 feet, on the vein, which still etands iu hoth the north and the south end of it, showing that the limits of the ore hody at thie depth are not yet reached. From the way in which these ore hodiee have lengthened as they have heen followed in depth, there ie every prohahility that the 300-foot level will develop an unhroken chute of pay ore from 800 to 1,000 feet in length; and as the ore for eome months past has yielded in the mill from $20 to $28 per ton, the value of the property will he readily apparent.

The mine is in a position of such assured success that the owners have determiued no longer to postpone the erection of hoisting machinery of ample power for all the requirements for years to come, the present more simple appliances having done the work for which they were deeigned. Two horizontal engines, hoisting works and pumps will he erected over the Ferguson ehaft, which is eunk helow the main level, at a point 1,000 feet in the mountain from the mouth of the level. Two air-compressors, each having two compressing cylinders, will supply the air as motive power for the engines and for rock drills, and will at the eame time furnish air for ventilating the more remote portione of the miue, which at present cannot be advantageously worked. These engines and air-compressore have heen huilt in this city hy Messrs. Reynolds & Rix, of Fremont street, from special design, and have heen much admired hy many practical mcn interested in every fresh improvement in our mining machinery. A turhine wbeel under a pressure of 30 feet, will give the power to run the air-compressors, the wator heing drawn from the Merced river, which forms the southern boundary of the mine, and furnishes an inexbaustihle stream in the driest seasons.

The Ferguson now takes its place among our dividend-paying mines, and all the features of the mine from which forecasts of its future may be made, point to its maintaining this satisfactory position for some time to come.

Recent Decisions Relating to Patents, etc.

We give helow brief ahstracts of decisions* rendered upon patent cases in litigation for the benefit of our readers.

Perry vs. Littlefield et al.

U. S. Circuit Court, Nortbern District of New York. Decided Nov. 10th, 1879. Blatchford, J.:

1. Re-issue, No. 4,000, May 31st, 1870, of Patent No. 53,251, Marcb 13th, 1866, and Re-issue, No. 1,823, Nov. 22d, 1864, of Patent No. 10,448, of Jan. 24th, 1854, to D. G. Littlefield, are for improvements upon Patent No. 8,047, of April 15th, 1851, to said Littlefield, and are included in an aseignment conveying an exclusive license under said patent of 1851, and improvements thereon.

2. When the parties to tbe suit are citizene of the same State, a hill to compel the execution of further tranefers under an agreement is not maintainahle in the United States Circuit Court.

Holbrook et al. vs. Small. Same vs. Matthews et al.

U. S. Circuit Court, District of Massacbusetts. Decided Oct. 9th, 1878. Lowell, J.:

1. Expenses of suit are never allowed in assessing damages; nor is interest to be computed upon the amount of profits, except under peculiar circumstances.

2. The powcr given the court by statute to treble the *damages* does not extend to *profits* in a suit in equity.

3. Costs having been taxed equitahly, and in tbe manner to whicb both partiee had consented, neither can he allowed to witbdraw consent upou coming in of the Master's report.

Master's report and clerk's taxation in eacb case affirmed.

* More completo reports of the proceedings may he found on file in the office of the MINING AND SCIENTIFIC PRESS Patent Agency, 202 Sansome street.

SIR JAMES FERGUSON bas heon appointed Governor of Bombay.

The Hofmann Process.

An article written by Wm. G. Kustel some little time since, describing the Hofmann process for the treatment of ores, attracted the attention of several gentlemen interested in metallurgical operations, who gave their opinions of the process in our columns. The controversy hinged more upon the patentability than the practicability of the process, as those who have followed the discussion know. In the last few numbers, however, the writers have dealt more in personalities than in matters of general interest to miners or metallurgists. While we are very glad to have these gentlemen discuss, as freely as they like, all matters connected with mining or metallurgy, personalities are not pleasant. The two letters given below, in answer to those of former correspondents, are inserted in a spirit of fairness to all, and as the conclusion of a discussion which, continued in its present form, would prove unprofitable to all parties.

Mr. Irelan's Statement.

EDITORS PRESS:—I have been a silent observer of the controversy relating to the "Hofmann process"—little thinking that any remarks in the premises would be demanded from me; but under the circumstances—a malicious accusation falsely made—silence would be an admittance of that which is not true.

Being as I suppose the person referred to by Mr. Ottaker Hofmann in your last issue as having been "found at the vats," I will give a correct statement of facts—and not Hofmannize.

In May last in company with a San Francisco "capitalist" I visited the Colorado mine, No. 2, situate in Monitor, Alpine county, California. I was assigned the duty of examining the concentrations, to see if they were properly worked, and other little chores.

On our arrival Judge Griffith, part owner of the property, said I should have an opportunity on the following day of examining into the object of any visit. After waiting patiently until the third day, I remarked that it seemed I was not to have the opportunity promised. On further conversation with Judge Griffith we inferred that Mr. Hofmann was jealous of the work allotted to me. The "capitalist" thereupon informed the Judge I was there in his employ and not to interfere with Mr. Hofmann; in fact I would not accept the position filled by that gentleman, as the salary he was getting would not pay me.

Whether Mr. Hofmann was informed of this last interview I do not know, and care less. We did not think it prudent to take Mr. Hofmann into our confidence. At any rate we were invited to visit the works. On our arrival at the assay office, which faced on the road, a short distance above the mill, I was requested by the capitalist to go into the works, and if Mr. Hofmann raised any objections, to retire. Never having seen the works before, it was natural that I should go in at the first entrance presenting. It so happened this was the all-important "back door" that Mr. Hofmann lays so much stress upon. It is not true that Mr. Hofmann "found me in front of the tanks," but upon entering the mill I went toward the place where I saw the workmen. On reaching the vats I saw Mr. Hofmann, and used the following words in explanation of my being there: I am not here with the object of finding out any secrets—neither do I wish your position. If you have any objections, please say so. He answered, that in connection with the process was an invention of his own which he wished to keep a secret for the present. I then told him I would return to the assay office.

Mr. Hofmann fathers a malicious falsehood when he states he refused to grant my request to visit the works. I never asked his permission to visit them. I was not there to ask or to receive favors from Mr. Hofmann. I was there with the party who was negotiating for the purchase of the property.

I cannot describe an article in place in the works at that time, neither had I the least idea of the Hofmann process, or ask any information thereon from any one, Mr. Hofmann's assertion to the contrary notwithstanding.

After arriving at the hotel, a gentleman asked me about my visit, and I gave him an evasive answer. This gentleman, several others being present, spoke about Mr. Hofmann's method of working; and although I am not the father of a "process," I was satisfied a success, according to the description, was an impossibility. I related to Mr. Hofmann, the same evening, as near as possible, the exact language this gentleman used.

I behaved gentlemanly and honorably toward Mr. Hofmann; and I think his unwarranted, unprovoked, unproven assertions in reference to me should be met with "*Honi soit que mal y pense*," or, in good old-fashioned English, "Young man, your chickens have come home to roost."

Mr. Aaron will bear me witness that, on my return to San Francisco, I told him Mr. Hofmann had informed me that he had a secret in his method of working, and I made no inquiries, and received no information, therefore could not impart any; neither did Mr. Aaron ask it.

I object decidedly to personalities, but if one should say you did, you certainly, in speaking the truth, cannot help saying you didn't. I never play at the game of throwing mud, as it is only those with soiled hands who are the winners—therefore I don't play a losing game.

The "traveling assayer" did carry new crucibles; the object is obvious. Mr. Hofmann accepted those same new crucibles as a gift from the "traveling assayer." The "traveling assayer" left of his own volition, and had pressing invitations from the powers that be to come back soon. Can Mr. Hofmann truthfully make the same statement?

I advised the "capitalist" if he purchased the property to retain Mr. Hoffmann as metallurgist, as he could do no better. Did I a make a mistake?

Mr. Hofmann after giving utterance to his unwarranted accusations, wishes to "forever drop the subject." It is another cry of "Save me, Cassius, or I sink."

WM. IRELAN, JR.

Metallurgist's Answer.

The letter of Mr. Hofmann, in your issue of February 28th, is difficult to answer, because I don't want to be so rude as to say it's all *nonsense*, and so dispose of it in one word, nor do I wish to write a book about it. Perhaps a few facts may help Mr. Hofmann to a better understanding of my position, and to a better temper. I shall speak for myself alone, leaving Mr. Dustken to speak for himself, though I think a part of what I say will be true also as to him.

I did not attack the *merits* of Hofmann's improvement, but the patent on it.

I do not doubt, nor have I intimated such doubt, the advantages of the method in certain cases, such as that in which it was applied by Mr. Hofmann, for I always supposed that he had tried the ordinary course first.

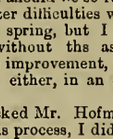
I have never used, or needed to use Hofmann's improvement, neither did I find out anything about it in "a roundabout way."

I never knew anything about the matter, till Judge Arnott applied to my partner for a man to superseds Mr. Hofmann at the Colorado No. 2. I then sent the young man, Beardsley, as I did not wish to go myself. From Mr. Beardsley I received all my information on the subject. If my partner knew last spring what was being done he never told me a word about it. I don't think he ascertained anything except that the company were satisfied with Mr. Hofmann's results. I think Mr. Hofmann's suspicions regarding my partner are as unfounded as his charges against me. Our recommending a young man for the position was a mere matter of business, and should be so regarded.

I did encounter difficulties with the Murchie sulphurets last spring, but I overcame them, measureably, without the assistance of Mr. Hofmann or his improvement, without knowing or thinking of either, in an entirely different way in fact.

When I attacked Mr. Hofmann's *patent*, not the *merits* of his process, I did so without ulterior motive, because I understood it to be a patent on the simple succession of the two processes, in which succession the usual order was reversed, and I thought and still think, that I have a right to do this as a matter of convenience if I think proper. The view of the case presented by Metallurgist had not then occurred to me, and as Mr. Kustel for the defence seemed to take his stand on the very ground which I disputed, that the mere "coupling" of two or more known processes constituted an invention, I continued the discussion with *him* on that basis, and on some incidental points.

FIG. 3.



To answer one of my own questions, as neither of my opponents has done, a question which I am not alone in asking, the reason why the amalgamation of my tailings, after the Plattner-Kiss process, would not be a patentable invention is, that it is not shown that the first part of the treatment is necessary to the success of the amalgamation, but the amalgamation is only supplementary.

If Mr. Hofmann is satisfied with Metallurgist's view, I am content, though, in view of the way in which "Hofmann's process, patented," is presented by Kustel, something might be said on the other side.

I hope with this to have done with a subject which *is* becoming "disagreeable," and I leave your disinterested readers to judge whether Mr. Hofmann's injurious suspicions and insinuations are based on fact, or whether he has looked into his own heart to find motives *sui generis* for others acts. Perhaps it may help him and others to a more just estimate to inform him that the Mr. Aaron of whom he entertains so mean an opinion is identical with the correspondent who indicated the only tenable argument in favor of *any* patent on the Hofmann process, who was actuated by a desire to do justice, and who signed himself

METALLURGIST.

Improvement in Microscopic Eye-Pieces.

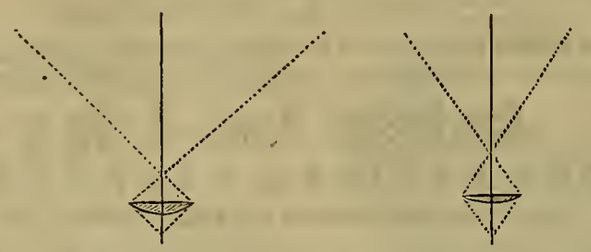
[By J. H. WYTHE, M. D.]

The magnifying power of microscopic objectives depends on the diameter of the cone of rays at the upper part of the tube of the instrument. As in Fig. 1, the cone of rays from an objective of short focal length is much wider at the base than the cone from one whose focal length is larger.

The diameter of such a cone may be increased by using a concave lens, or msuiscus, which produces still greater divergence, as in Fig. 2.

If this diverging lens be made achromatic, no injurious effect can happen to the image formed by the objective, save the loss of light consequent on enlargement. Even a non-achromatic concave lens or meniscus may be usefully employed to amplify the image, so that an objective of low power may be made to magnify an object as much as one of shorter focal length.

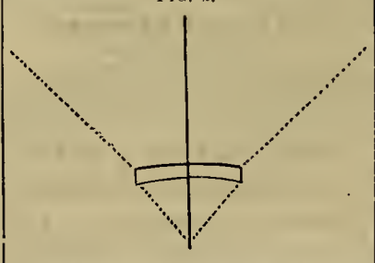
FIG 1.



Theoretically, a perfectly achromatic amplifier is needed, but practically, one not achromatic is quite useful. The degree of amplification depends on the concavity of the amplifier, its nearness to the objective, the length of the tube, and the power of the eye-piece used to concentrate and magnify again the image produced.

The diameter of the microscope tube has an important relation to the distinctness and luminosity of the image. Few tubes are wide enough to utilize more than a small proportion of the rays proceeding from an objective. The field glass of the eye-piece should be of the greatest diameter possible for its focal length, and the tube wide enough to receive it, in order to concentrate the greatest number of rays from the objective. The short tubes of French and German microscopes are supplied with narrow eye-pieces, which cut the cone of rays nearer the objective and give a more brilliant image than would be possible in a longer tube. If the tube be longer, it must also be wider, and the eye-piece of corresponding diameter.

FIG. 2.



In considering the construction of the microscope with a view to greater amplification by the eye-piece, it occurred to me that the concave lens or meniscus used to diverge the rays of the objective should form a part of the eye-piece and be of as large diameter as the tube will allow. If it be of small diameter, it must be placed nearer the objective. This is the form and position of the amplifiers of Tolles, Zentmayer and others.

One of the amplifiers, exhibited by me to the San Francisco Microscopical Society on a previous occasion, consists of a conical meniscus (Fig. 3), whose position in the tube and effects correspond with the amplifiers above named. With this simple addition placed in the lower end of the draw tube, the magnifying power of an objective can be nearly doubled with little loss of light or of definition.

The Other Form of Amplifier

Exhibited is still better. A double concave lens, or meniscus, of as great diameter as the tube will allow and of considerable diverging power, is placed at a distance of from two to four inches in front of the eye-piece. In the improved form in which I now present it, a concave meniscus of six inches equivalent focus and one and a half inches diameter (which formerly served as part of the object-glass of a small telescope), is placed in a draw-tube at the end next the eye-piece and about three inches from the latter. To counteract the aberration of the amplifier, I have sometimes substituted for the plano-convex field glass of the Huygenian eye-piece a convex meniscus of short focus, which gives also a very wide and flat field of view. Ordinary eye-pieces and the periscopic eye-pieces of Gundlach may also be used with the amplifier. The amplifying eye-piece, thus constructed, has given me great satisfaction. If the concave meniscus were made achromatic, it would doubtless be a still further improvement, yet the performance of the eye-piece leaves little to be desired. The wavy, basket-like, longitudinal striæ on *Surirella gemma* and the hexagons on *P. angulatum* are well seen with a one-fourth objective, and the *Frustula Saxonica* and *A. pellucida* (dry) have been resolved by it with a non-adjusting one-eighth of Gundlach's.

In Place of the Concave Meniscus

Referred to, I have also used, with nearly as good effects, a double concave lens of two or three inches equivalent focus, such as can be obtained at an optician's for about 50 cents. So that by a very small cost of time and money, the possessor of an ordinary objective may increase the power of his instrument to a very great degree.

I reiterate the conviction before expressed, that further improvement of the microscope may be looked for in the construction of eye-pieces—regulating their magnifying power and increasing their diameter so as to concentrate rays from the objective, which are now absorbed by the sides of the tube.

Legislative Matters.

Mr. Chamberlain's new bill to prevent the flow of mining debris in certain rivers of this State, provides that the State and two consulting engineers are constituted a Board of Engineers, whose duty it shall be, under the direction of the Governor, to proceed immediately to the construction of a series of such dams or other works on the Yuba, Bear, Feather and American rivers, at such points in the mountains or foothills, as to said Board shall seem most effectual, to arrest and stay the flow of debris from hydraulic mines, the cost not to exceed $600,000; no plan not to be adopted unless concurred in by two of said Board and the Governor—the Secretary of State Engineer to be Secretary of the Board. Each month's report shall be made of work done and work contemplated for ensuing months. The right of eminent domain may be exercised under Title 7, Civil Code, for the purpose of condemning land upon which to build dams and other works, and to stow debris; all of which is declared a public use. It also provides for keeping and payment of accounts, and appropriates $600,000. Chinese or Mongolian labor is prohibited.

Mr. Carr, of Yuba, has also introduced a bill to dispose of mining debris, and protect the rivers and lowlands of California from drainage thereby. It provides for a Board of State Drainage and Protection Commissioners, to consist of the State Engineer, Surveyor-General, and the Governor, who shall preside, and a Secretary, at $2,400. The Board shall report on or before the 1st of January, annually. The State Engineer shall, within thirty days after the passage of the act, submit to the Board a report containing the result of his investigation as to drainage and protection, with plans, having in view the object of the act, and state localities where protection is most needed; and then the Board shall proceed to act. Lands may be condemned under the Code, but no levees, embankments, etc., shall be purchased, except on proof of actual damage made. To pay expenses, a tax of one-tenth of one per cent. on all taxable property in the State, in addition to other taxes, shall be levied in 1880.

A bill has been introduced, and referred to the Committee on Mines, adding new title to the Code authorizing the establishment of mining districts by Boards of Supervisors.

Braunhardt has introduced a bill which is supposed to encourage the mining interests and suppress stock gambling. The bill is similar to that introduced in the Legislature of 1878 by Tuttle, with additional sections providing for advertising mining notices of incorporations.

The Assembly Committee on Mines and Mining has agreed to recommend Wasson's bill for the establishment of a Mining Bureau at San Francisco for the collection of mineral specimens.

WE call attention of mining and quartz millmen to the advertisement in another column of W. E. Shepman, proprietor of Pacific Gold, Silver, etc., Plating Works, established in 1868. They furnish silver-plated amalgamating plates for saving gold, and guarantee good work and lowest rates. The works have lately been removed to 41 Geary street, San Francisco.

THE delivery from the Benicia arsenal of $12,000 worth of arms and ammunition to the Governor of California has been ordered by the Secretary of War.

SIX men and several teams were buried in a snowslide Friday last at Logan, Utah, but subsequently four of the men were rescued.

THE war between the Western Union and American Union Telegraph Companies is becoming very warm in the Northwest.

A Glacier in Colorado.

A gentleman who has during the past two years traversed the mountains in the vicinity of Leadville, and penetrated almost evcry one of the secret recesses, informed a *Herald* reporter yesterday that there is within 25 miles of this city one of the most interesting curiosities of nature—a veritable glacier, presenting all the characteristics of the glaciers of Switzerland, both in magnitude and motion, its progress he ing gradually down the gulch. The scene of this curiosity is located in the Mosquito range, about 15 miles north of the pass. Our informant states that he first discovered it about three years ago, when out on a prospecting tour. It was then nearly a mile in length, and at the hottom of the gulch presented a sheer precipice of ice not less than 150 feet in hight. Later in the season the place was visited again, when it was found that the great mass of ice had melted uutil at its face it was not more than 100 feet high, the loss from the surface reducing its length to ahout half a mile. Again, early in the following year, the place was visited, and the glacier was found to have regained its hulk, showing that the accumulation of ice and snow during the winter was ahout one-third its gross hulk.

The rocks on the sides of this immense mass of ice show the marks of attrition, proving he yond all controversy that the glacier is in motion. Indeed, the earth at the foot of the glacier, heaved up in great masses, shows that it is gradually moving down the gulch into the valley. During the summer a large stream of water flows from the face of the ice cliff. Our informant is of the opinion that the glacier, as it progresses out of the deep gorge in which it was formed, will slowly melt away, and that it will not last many years. It is out of the way of ordinary travel, and the route to the scene is exceedingly difficult, so that it is not likely to be visited except by prospectors and hunters.—*Leadville Herald.*

Mining & Scientific Press Patent Agency.

THE MINING AND SCIENTIFIC PRESS PATENT AGENCY was established in 1860—the first west of the Rocky Mountains. It has kept step with the rapid march of mechanical improvements. The records in its archives, its constantly increasing library, the accumulation of information of special importance to our home inventors, and the experience of its proprietors in an extensive and long continued personal practice in patent business, affords them combined advantages greater than any other agents can possibly offer to Pacific Coast inventors. Circulars of advice, free. Address,

DEWEY & CO.,

202 Sansome St., N. E. Cor. Pine,

San Francisco.

Entirely different from other Saws. When dull, sharp teeth, which only cost a trifle, can be inserted in a few minutes, without taking the saw off of the mandrel, and no skill is required in doing it. Send for Catalogue showing their vast superiority. More of them are being sold than of any other kind, and we are altering all other kinds to the Chisel Tooth.

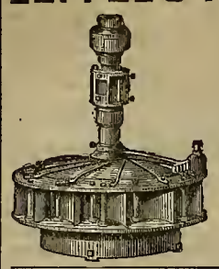
TATUM & BOWEN,

329 Market Street, 3 Fremont Street.

FOR SALE, CHEAP.

Second-hand Varney Rock Breaker, large size. J. W. Riley, 50 Bluxome St., San Francisco.

LEFFEL'S IMPROVED WATER WHEEL.



PRICES REDUCED!

PATENTS REISSUED 1868.

The "OLD RELIABLE" with improvements, making it

THE MOST PERFECT TURBINE NOW IN USE,

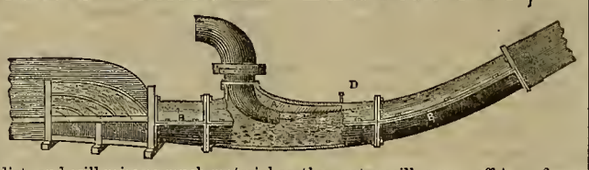
Comprising the **Largest** and the **Smallest** Wheels, under both the **Highest** and **Lowest** head used in this country. Our new Illustrated Book sent free to those owning water power.

Those improving water power should not fail to write us for **New Prices,** before buying elsewhere. New Shops and New Machinery are provided for making this Wheel. Address

JAMES. LEFFEL & CO., Springfield, Ohio, and 110 Liberty St., N. Y. City.

HYDRAULIC GRAVEL ELEVATORS,

For working flat gravel mines that have no dump.



Sluices gravel and water up hill on an angle of 45°, and will run any kind of gravel that will run in a flume. Handles rocks as easy as fine dirt, and will raise as much material as the water will carry off in a flume on 6 inches grade to 12 feet.

No hedrock cuts, tunnels or drains required. Machine a sufficient drain itself, and the process of mining the same as any other hydraulic mine. Is now a practical success in various places in California and Oregon. Send for descriptive circular to

JOSHUA HENDY,

No. 51 Fremont Street, Office of the Hydraulic Gravel Elevating Mining Co., S. F

History, Development and Action; Classification and Comparison; Manufacture, Care and Use of SAWS of all kinds. Large Octavo. Over 153 Illustrations.

By ROBERT GRIMSHAW, Ph. D.,

Member of the Jury on Wood-working Machinery at Paris Exposition of 1878.

This thorough work, impartially written in a clear, simple and practical style, treats the Saw scientifically, analyzing its action and work, and describing, under the leading classes of Reciprocating and Continuous Acting Saws, the various kinds of large and small hand, sash, Muley, jig, drag, circular, cylinder and band Saws, as now and formerly used for crosscutting, ripping, scroll-cutting, and all other sawing operations in wood, stone and metal, ice, ivory, etc., in this country and abroad. With appendices concerning the details of manufacture, setting, swaging, gumming, filing, etc., tables of gauges, log measurements from 10 to 24 feet, and from 12 to 96 inches, lists of all U. S. Patents on Saws from 1790 to 1880, and other valuable information. Elegantly printed on extra heavy paper, wide margin, copiously indexed

Owing to an increase of nearly 100% in number of pages and illustrations since first projected, the subscription price is this date made $2.00, postage paid, up to date of publication, after which time full retail price will be charged. In press Orders received now at subscription price, $2.00.

ROBERT GRIMSHAW,

624, 626 and 628 Market Street, Philadelphia.

January 1, 1880.

Kendall's Spavin Cure

Is a sure cure for spavin, splint, curb, callous, sprains, swellings, galls, lameness and all enlargements of the joints or limbs. It will completely remove a bone spavin without blistering or causing a sore. It is also as good for man as for beast, and is used full strength at all times of the year with perfect safety. A cure which we are knowing to is a person who suffered 15 years with hip-joint lameness and was permanently cured two years ago with Kendall's Spavin Cure. Remember we claim it will cure a bone spavin and completely remove the bunch without blistering.

Office U. S. Marshal, Western Dist. of Michigan, } Kalamazoo, April 15th, 1879. }

B. J. Kendall, Enosburgh Falls, Vt.—DEAR SIR:—I received the two bottles of your spavin cure forwarded by express in January last. I am happy to state that it performed all your advertisement called for. In three weeks after I commenced using it the spavin was entirely removed and a valuable horse estored to usefulness. Very truly yours, JOHN PARKER.

Send for illustrated circular giving positive proof. Price, $1 All Druggists have it or can get it for you.

118 and 120 Market Street, and 15 and 17 California St., San Francisco.

We would call the special attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our stock of Clay Crucibles, Muffles, Dry Cups, etc., manufactured by the Patent Plumbago Crucible Co., of London, England, for which we have been made *Sole Agents for the Pacific Coast.* Circulars with prices will be sent upon application.
Also, to our large and well adapted stock of

Assayers' Materials & Chemical Apparatus,

Having been engaged in furnishing those supplies since the first discovery of mines on the Pacific Coast.
☞Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application.

JOHN TAYLOR & CO.

W. BRUCKNER'S
ROASTING FURNACE
AND
Ore Pulverizers.

(Awarded the Premium Gold Medal at Naples, Italy.)

The furnace is especially adapted for roasting rebellious ores; there are more than fifty in use in Colorado, giving perfect satisfaction.
The Ore Pulverizer is built in different sizes. It is preferable to Stamp Mills because it requires less power and less repairs than Stamps. No extra expense for setting up, and no foundation. Less weight and less cost than stamps.
Furnished also in sections for packing.
For circulars and prices apply to

Ingersoll Rock Drills.

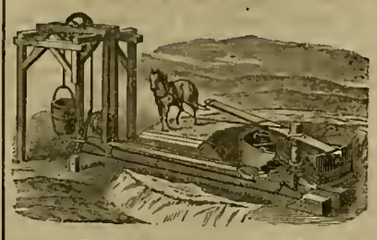
In use in the largest and best Mines of the Coast.

HAS AUTOMATIC FEED.

Has less Repairs.

Is Lighter and more Easily Adjusted than any other Drill.

Our DRY AIR COMPRESSORS are the most Economical Compressors in the Market.



MINERS' HORSE-POWER.

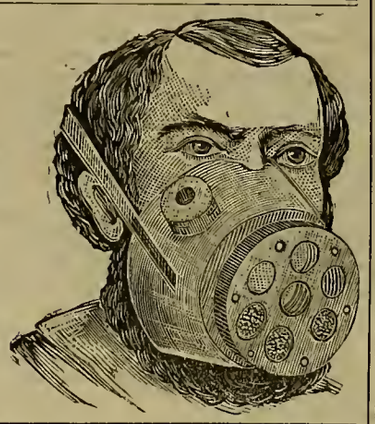
This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.
The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing

REYNOLDS & RIX, 49 Fremont Street, San Francisco.

PATENT

LIFE-SAVING RESPIRATOR

Prevents Lead Poisoning and Salivation.



INVALUABLE to those engaged in Dry Crushing Quartz Mills, Quicksilver Mines, Guano Works, White Lead Corroding, Feeding Threshing Machines and all occupations where the surrounding atmosphere is filled with dust, obnoxious smells or poisonous vapors. The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, $3 each, or $30 per dozen. Sent post-paid to any address upon receipt of price.

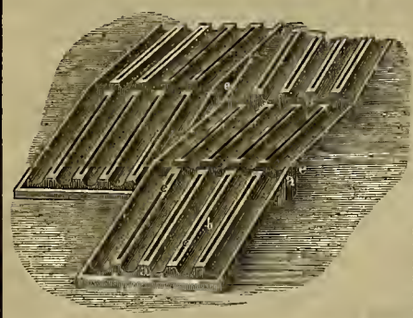
309 California Street, San Francisco, Cal.

Send for Descriptive Circulars containing testimonials of well-known parties who are at present using them.

Howland's Under-current, Mill and Sluice Riffle.



This invention meets a want which has long been felt by Gravel Miners and Millmen, viz.: that of a simple, cheap Riffle which will save the largest possible amount of gold or sulphurets, with the least possible waste of quicksilver. That this Riffle answers all these conditions will be apparent to any practical man who takes the trouble to examine it. The arrangement of this Riffle is such that there is a strong, unobstructed upper-current to carry off and break up the gravel or cement, and a slow under-current, checked by numerous riffles, which give gold or sulphurets a better opportunity of settling than if they were exposed to the force of the main current.
In this Riffle there are cast troughs for the quicksilver, which extend entirely across the sluice, and while they are so placed that the current will naturally pitch towards them, and give every opportunity for amalgamation, the quicksilver is fully protected from flouring or leakage. There is no mechanical skill required in taking out or replacing the sections.

Full particulars in regard to this invention can be obtained by applying to

STEIGER & KERR, of the Occidental Foundry, 137 First St., S. F.,

Who have the sole right of manufacturing this Riffle, and who will receive and attend to all orders.

GEO. S. LADD, President. ANDREW WHITE, Secretary.

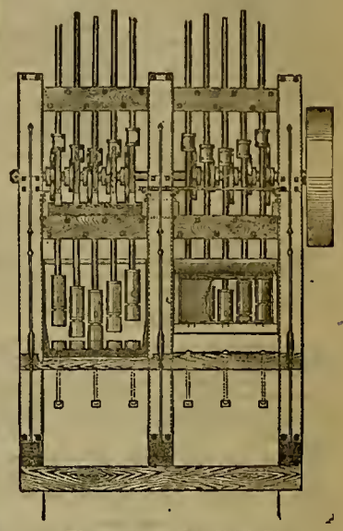
Machinery.

GOLD AND SILVER
Grinding and Amalgamating MACHINERY.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chlorodizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies.



SPERRY'S
Wrought-Iron Frame
FOR STAMP MILLS.

Great saving in time and money over the wood frame. Is made complete with wrought-iron frame ready to put upon the foundation, requiring no skilled millwright. These mills are unsurpassed in excellence in every particular.
We are furnishing all the Machinery for a 10-Stamp Gold Mill, including Crucible, Steel Shoes and Dies, Boiler and Engine, Counter Shafting, Pulleys, etc., Stamps weighing 450 lbs. each, with Copper Plate inside of the Mortars, and for tables outside, making all the Machinery complete for a 10-Stamp Mill for the sum of

$2,550.

We construct Mills with Stamps weighing from 350 to 900 lbs. for gold or Silver Ores. Wet or dry Crushing Mortars. Will contract to erect complete Gold and Silver Mills on the most improved plans. We have 30 years' experience in mining and milling Gold and Silver Ores, and can compete with the world. Send for a circular. Address

A Card from Architects.

The California Architect and Building Review.

Office, No. 240 Moutgomery Street, San Francisco, Cal.

It is with pleasure that we publish the following from prominent Architects in this city:
Believing that a journal of its kind is a necessity on this coast, and judging from what has appeared in the "Quarterly Architectural Review," we are led to believe that the CALIFORNIA ARCHITECT AND BUILDING REVIEW will be worthy of generous support and encouragement. We therefore pledge our cordial sympathies, personally, and hope that the enterprise will receive kindly recognition and liberal support from all Architects and Builders and the public generally. (Signed) David Farquharson, Wright & Sanders, S. H. Williams, Thos. J. Welsh, P. Huerne, John Marquis, B. McDougal & Son, Wm. Mooser, Wm. Curlett, Meeker & Banks, W. C. Hoagland, S. & J. Newsom, B. Heurickson.

AN ENGINEER,

Favorably known in the East, desirous of settling in California, seeks position as Superintendent or Chief Draughtsman. Competent to design Stationary, Marine, Locomotive, Mill Work, Sugar and Hydraulic Machinery. Speaks Spanish. Unexceptional references. Address EXPERT, this office.

CONTINUED FROM PAGE 149.

tom. Several mill runs have been made which returned from 55 to 105 ounces in silver per ton. The ore is free milling, and can be treated under stamps at an expense of but a few dollars per ton.

HERCULES & SEVEN-THIRTY.—A fine body of ore was struck in the 80 level running west from the Roe shaft. The vein is about a foot in thickness, composed of galena carrying ruby and gray copper, and is worth $400 or $500 per ton.

PIONEER.—This property has been improving steadily during the past summer as developments has progressed in the lower workings. The mine pays dividends as regularly as a national bank, and if it had a 100-stamp mill instead of a 16, it would be one of the great mines of the country.

O. K.—*Register-Call*, Feb. 27: The level going west from the tbe second station is in 205 ft, a very good ore vein having been passed through in the last 40 ft.

BOSS NO. 2.—This property, situated in Quartz Valley Mining district, sent off last week 738 pounds of first-class ore, for which $437.97 were paid, being at the rate of $905.90 per ton; also 5,332 pounds of second class assaying 399 ounces silver per ton, for which was received $953.60, or a total of $1,296.66.

HASELTINE.—A load of first-class ore brought $1,020.90 over and above treatment. The ore weighed 2,612 pounds, or a price value of $783.70 per ton. The ore came from the 100 west level, in the bottom of which there is a good vein. There is now in sight in this particular portion of the mine $15,000 worth of ore.

IDAHO.

MONTANA.—*World*, Feb. 24: Near Bonanza City, is beyond doubt the richest gold and silver mine on the continent. At the depth of 140 ft the vein is from 12 to 15 ft wide, and the ore worth from $2,000 to $5,000 per ton.

ELK HORN.—Work has been resumed on the Blue ledge, which yielded so much bullion in early days, and about 40 tons of ore taken out. The vein is four and a half ft wide.

UTAH.

PARK ITEMS.—*Mining Review*, Feb. 21: Information reaches us that coal has been discovered near Heber. If the indications as reported are reliable, the owners can find a very good market in Park City. The Ada No. 1 has struck a three-ft vein of ore which assays from $113 to $600 per ton in silver. Over 600 tons of bullion lie on the dump of the Frisco smelter awaiting transportation, and is fast accumulating on the Horn Silver smelter's dumps.

BINGHAM ITEMS.—The Howard has two men at work drifting on the vein, which is about three ft wide between walls. The ore averages about $50 per ton. At the Red Cross a tunnel is being run on the vein and is in about 130 ft.

BARBEE & WALKER.—Silver Reef *Miner:* The main working incline runs to the 300 station at an angle of 45°. The first south level started 125 ft from the mouth of the incline is in 160 ft on the vein; the ore is of high-grade and continues to the surfaces. The second south level in 179 ft and shows fair grade ore; the upraise from this level shows a large amount of pay rock. The bottom of the incline is 40 ft below the 300 level, which runs north 400 ft. A crosscut east from the main vein near the station is run 50 ft and strikes a back ledge of high-grade ore. Another crosscut has been run from the face of the drift 40 ft west and a fine body of ore uncovered. The 200 north level shows a vein of high-grade ore, the richest that the mine ever produced.

Meetings and Elections.

GOLDEN CHARIOT M. CO.—Mar. 2. Trustees: Sam'l Rosener (President), Joseph Clark (Vice-President), John Rosenfield, R. T. Carroll, H. W. Scales, B. Speur, A. Borland. The Secretary is J. T. McGeogbau and Treasurer Augio-Californiа Bank.

PACIFIC ROLLING MILL CO.—Trustees: D. O. Mills, Wm. Alvord, Louis McLane, Nicholas Luning and James O. Fair. The Trustees organized by electing the following officers: President, William Alvord; General Manager, L. B. Benchley; Superintendent, Patrick Noble; Secretary, C. M. Keeney.

MINING TRUST CO.—In connection with the new Mining Exchauge in New York, a Mining Trust Co. has been organized and the following officers elected: President, H. G. Stebbins; Vice-President, Elisha Riggs; Mining Director, Milton S. Latham; Treasurer, C. F. Christiansen; Secretary, Drake DeKay; Board of Trustees—L. Von Hoffman, H. G. Stebbins, Elisha Riggs, R. C. McCormick, L. M. Lawson, H. A. W. Tabor, Drake DeKay, S. B. Elkins, A. P. K. Safford, Henry Havemeyer, W. F. Shafer, R. W. Leavitt, Milton S. Latham, J. B. Chaffee and George D. Roberts. The new board will be known as the American Mining Stock Exchange. The membership will be limited to 800, and will be entitled to a share in the Trust company. The annual dues will be $100. Business will commence when 100 members are enrolled. All the stocks placed on the list will pay $500 fees and a tax of $100 annually. All the managers of mines listed at the exchange are required, as early as possible, to make arrangements for the registry and transfer at the office of the Mining Trust company in New York city. This rule will force mines listed on the board to have offices in New York, and will practically transfer all the business of the mines so listed from the Pacific to the Atlantic coast.

News in Brief.

A SEVERE earthquake occurred at Yeddo on the 25th.

CHIEF DOUGLASS has been placed in the fort at Leavenworth, Ks.

THE entire Russian fleet in the Ural sea has been ordered into the Oxus.

THE President has nominated Pinobback to be Naval Officer at New Orleans.

YELLOW fever prevails on board the U. S. steamer *Marion* at Montevideo.

THE death of the wife of Chief Justice Prince, of New Mexico, is announced.

THE strength of the British force in Burmah is to be maintained another year.

THE work of boring the St. Gothard tunnel was satisfactorily completed Feb. 29th.

THE unemployed workingmen at Ottawa, Ont., are showing signs of discontent.

THE condition of Princess Louise is said to be more serious than at first reported.

JOHN MCGINLEY was stabbed 22 times at Gold Hill, Nev., recently, by A. J. Caldwell.

A COMMISSION of Supreme Control has been appointed at St. Petersburg by the Czar.

VERA SASSULITCH, the famous female Nihilist, has been arrested at St. Petersburg.

THE order prohibiting the importation of neat cattle from Canada has been revoked.

THE coinage at the Mints during February was 3,885,020 pieces, of the value of $5,129,969.

THE Postmaster-General's recent order in regard to the Star mail service has been suspended.

THE King of Belgium is sending six small steamers to Stanley, for use on the Congo river.

THE recent severe weather in Idaho and eastern Oregon caused a loss of 20,000 head of stock.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

[From Official Reports for the "Mining and Scientific Press," Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

FOR THE WEEK ENDING FEBRUARY 24, 1880.

234,886.—APPARATUS FOR BURNING HYDRO-CARBONS—H. H. Fames, S. F

224,937.—ENGINEER'S SHOE—W. H Mintzer, Clayton, Cal

224,938.—PAVING TILE—W. J. Mitchell, S. F.

224,939.—RETURN CRATE—R. E. Morey, SanGabriel, Cal.

224,940.—ORE FEEDER—D. J. O'Harra and D. Feit, Reading, Cal.

224,954.—MEDICAL COMPOUND—T. J. Robbins, Middletown, Cal.

224,957.—MINER'S COMBINATION TOOL — W. S. Rosecrans, San Francisco.

224,964.—VALVE-GEAR FOR STEAM PUMPS—W. P. Stephenson, Portland, Ogn.

224,975.—GRAPE PICKER—T. C. Truman, Fresno, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

RETURN CRATE.—Roswell E. Morey, S. F. Patented Feb. 24, 1880. No. 224,939. In sending fruit, vegetables, poultry, game and other articles to market, boxes, crates or coops must be employed, and these, when empty, are either broken up or lost to the shipper, or else they must be returned by the transportation companies at their own expense, which is the usual custom. In order to reduce these empty packages to smaller dimensions, so that the expense of transportation will be lessened, various methods for folding them have been tried, in many of which hinges have been employed. These hinges become broken or torn off, and the expense of manufacturing is also considerable. In this device the crate or box is formed, the sides and ends of bars which are preferably rounded on the inside by suitable means so as not to bruise the contents. The ends of these bars meet at the four angles, and a long bolt passes through the overlapping ends at each of the four corners, extending from top to bottom. The top and bottom may be made of slats, or of boards to form a tight top and bottom, as may be desired. When this crate is empty the top and bottom are removed, and the sides turn about the bolts and fold together.

PAVING TILE.—Wm. J. Mitchell, S. F. Patented Feb. 24, 1880. No. 224,938. This invention relates to certain improvements in tiles and blocks which are employed for paving purposes, and it consists in the formation of a block, so that its upper half will project beyond the lower half upon two adjacent sides, said projecting portions being provided with dovetail depressions and interlocking projections. By this construction the projecting upper half of each block will rest upon the corresponding projections of the lower halves of the two blocks lying next to it upon these two sides, and each block thus supports two others, and is, in turn, supported by two others. It is usually preferable to lay the tiles with cement, so that when it has set the whole bed will be solid.

Economic Geology at the University.

EDITORS PRESS:—Some time ago I sent from the University circulars to the mine owners, Superintendents and Presidents of the Pacific coast, asking their co-operation in the formation at the University of a collection of ores, wall rocks and other useful minerals, that should be a complete representation of the economico-geological resources of the State. My object in founding such a collection was three-fold. First, that there might be at some central accessible locality a collection of ores that might be consulted at any time by any one interested in our metalliferous resources; the existence of such a collection would certainly be of great convenience to the mining community, often saving laborious journeys into the mountains for the examination of material that might be just as easily consulted here. Second, that the requisite material might be at hand for the illustration of my lectures upon Economic Geology, to be delivered to the students of the College of Mines. Third, that the geological relations of the ore deposits of the coast might be systematically studied. Much has been learned, it is true, from the examination of separate, isolated deposits, but they have never yet been studied *as a whole*. They could not be, because such investigations could not be carried out without the aid of an extensive collection of ores and wall rocks, and till now such a comprehensive collection as is contemplated has never been made. Ore deposits are subject to *laws*, but it has been found that very few only of these laws are of such a *general* character that the results of the experience of one country can be safely applied to another. Every mineral region must be studied by itself, and the laws of its formation worked out independently. I conceive this to be a work of the greatest practical value to California, and sincerely hope that it will be appreciated and forwarded by every one in anyway connected with the mining interests of the State.

The matter to which I desire particularly to call the attention of the mining public through the columns of your valuable paper, is the fact that the large majority of those who in response to my circular have sent material to the ore deposit collection have desired assays of the material sent. Now aside from the fact that the State has never authorized this department to enter into competition with private enterprise in the prosecution of commercial assays, is the further utter impracticability of attempting such a thing. As soon as it should become generally known that the State furnished assays free of charge, it would require the constant services of half a dozen assistants to keep abreast of the demands that would flood in upon us.

It must be accepted as a fundamental principle that no department of the University will ever undertake commercial work of any kind, and the success of the museum of economic geology, so far as it depends upon the co-operation of the mining community, must rest entirely upon the appreciation of the great importance of the three objects above indicated.

A. W. JACKSON.

University of Cal., Berkeley.

FRESH attractions are constantly added to Woodward's Gardens, among which is Prof. Gruber's great educator, the Zoographicon. Each department increases daily, and the Pavilion performances are more popular than ever. All new novelties find a place at this wonderful resort. Prices remain as usual.

Chew JACKSON'S BEST Sweet Navy Tobacco

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Atlanta Mining Company.—Location of

principal place of business, San Francisco, California. Location of works, West Tintic Mining District, Juab County, Utah.

Notice is hereby given that at a meeting of the Board of Directors, held on the Second day of January, 1880, an assessment (No. 1) of Five Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, room 7, No. 420 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Fifth (5th) day of February, 1880, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Friday, the Twenty-Seventh (27th) day of February, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. MCGREW, Secretary.

Office—Room 7, No. 420 Montgomery street, San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Thursday, February 26th, 1880, and the day of sale to Monday, the 22nd day of March, 1880. By order of the Board of Directors.

A. F MCGREW, Secretary.

Office—Room 7, No. 420 Moutgomery street, San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Wednesday, the 17th day of March, 1880, and the day of sale to Saturday, the 10th day of April, 1880. By order of the Board of Directors.

A. F. MCGREW, Secretary.

Office—room 7, No. 420 Montgomery St., San Francisco, California.

California and Oregon Land Company.—

Principal place of business, San Francisco, California. Location of works, Lake and other counties, Oregon.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 5th day of February, 1880, an assessment of Thirty cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin, to the Secretary.

Any stock upon which this assessment shall remain unpaid on the 15th day of March, 1880, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Thursday, the 15th day of April, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

R. N. VAN BRUNT, Secretary.

Office, 318 Pine street, room 5, San Francisco, California.

Cataract and Wide West Gravel Mining

Company. Principal place of business, San Francisco, California. Location of works, Eho Mining District, Calaveras County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 2nd day of February, 1880, an assessment (No. 2) of Twenty-five cents (25 cts.) per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin, to the Secretary at 25½ Kearny street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 8th day of March, 1880, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 29th day of March, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

WM. B. LAKE, Secretary.

Office, room 18, 25½ Kearny Street, San Francisco Cal.

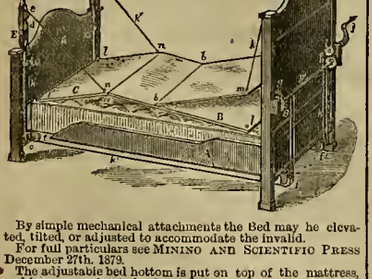
N. W. SPAULDING'S

PATENT DETACHABLE TOOTH SAWS,

Manufactory, 17 & 19 Fremont St., S. F.

The Archer Patent Invalid Bed.



By simple mechanical attachments the Bed may be elevated, tilted, or adjusted to accommodate the invalid.

For full particulars see MINING AND SCIENTIFIC PRESS December 27th, 1879.

The adjustable bed bottom is put on top of the mattress, and by means of noiselessly operating cords and pulleys the patient may be put in any desired position.

The bed is adapted for persons in good health who wish an easy position, as well as it is for invalids.

This bed is of the latest improved form, with a view to simplicity, convenience and ease to the occupant.

A limited number of State and County Rights for sale.

Orders for the Patent Bed can be filled immediately.

Satisfaction will be given to those desiring to interest themselves in the manufacture or sale of this article.

SUB-IRRIGATION.

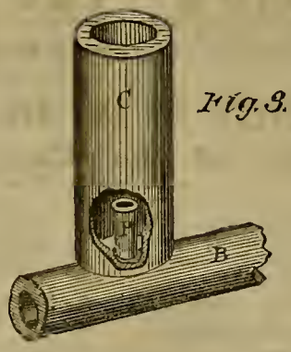

Fig. 3.

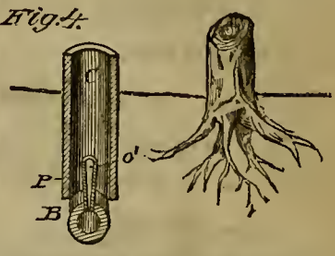
Fig. 4.



—FOR—

Orchards, Vineyards, Small Fruits, Alfalfa, Lawns, Vegetables, Etc.

The Asbestine System consists in conducting the water in conorete pipes laid below reach of the plow.

It savcs from three-fourths to nine-tenths the water used in surface irrigation.

It is under perfect control, and can be applied wherever irrigation is needed.

The surface remaining dry there is no need of Summer Cultivation, either before or after irrigating.

The soil is never excessively wet *and cannot bake*, but remains moist, loose and at a nearly uniform temperature, promoting a long-continued Summer's growth.

Aoything which the soil lacks as plant food (manure, lime, etc.,) can be easily, directly and economically applied in liquid form; the pest of the vineyard—phylloxera—can thus be easily reached.

No grading is necessary, as the system works perfectly on hillsides and undulating land.

Roots *cannot* get into the pipe, neither can it *suck mud*—difficulties never overcome by any other system of sub-irrigation.

The pipe is made cootinuously with a recently patented machine which *makes and lays* it in the trench, following all the undulations and curves.

Water is not kept in the pipes; but is applied abont twice a month.

Three men will easily lay 1,200 feet of two-inch pipe in 10 hours.

This system and machines used are fully protected by U. S. Patents.

Our pipe machine makes the cheapest and best tile drain known, and is especially valuable for making and laying pipe for conducting water from springs, ont of canyons, etc.

MANUFACTURERS OF

STEAM ENGINES, BOILERS AND ALL Kinds of Machinery for Mining Purposes.

Flouring Mills', Saw Mills' and Quartz Mills' Machinery constructed, fitted up and repaired.

Front Street, Between N and O Streets, SACRAMENTO, CAL.

PHELPS MANUFACTURING COMPANY,

Manufacturers of all kinds of

Wharf and Bridge Bolts, Railroad Treetle Work, Car Frames and Bolts, Machine Bolts, Set Screws and Tap Bolts, Lag or Coach Screws.

ALL STYLES OF FANCY HEAD BOLTS. HOT AND COLD PRESSED HEXAGONAL AND SQUARE NUTS, WASHERS, BOLT ENDS, TURNBUCKLES, ETC., ETC.

13, 15 and 17 Drumm St., near California,

SAN FRANCISCO, CAL.

Golden State & Miners Iron Works,

Manufacture Iron Castings and Machinery of all Kinds at Greatly Reduced Rates.

STEVENSON'S PATENT

Mold-Board AMALGAMATORS,

Golden State Pressure Blowers.

First St., between Howard & Folsom, S. F.

California Brass Foundry,

No. 125 First Street, Opposite Minna.

SAN FRANCISCO, CAL.

All kinds of Brass, Composition, Zinc, and Babbitt Metal Castings, Brass Ship Work of all kinds, Spikes, sheathing Nails, Rudder Braces, Hinges, Ship and Steamboat Bells and Gongs of superior tone. All kinds of Cocks and Valves, Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, furnished with dispatch. PRICES MODERATE.

J. H. WEED. V. KINGWELL.

California Machine Works,

WM. H. BIRCH, Prop'r.

119 Beale Street, San Francisco.

General Mechanical Engineer and Machinist. Steam Engines, Flour, Quartz and Mining Machinery. Sole manufacturer of Brodie's Patent Rock Crushers and Steel-Faced Tappits. Agent and Manufacturer of F. A. Yousc's Patent Steam Packing Rings for Steam Pistons. The best ever invented; can be applied to any Engine Piston and give entire satisfaction to those using. Steam, Hydraulic and Sidewalk Elevators. Repairing promptly attended to.

STEAM ENGINES AND BOILERS

Of all sizes—from 2 to 60-Horse power. Also, Quartz Mills, Mining Pumps, Hoisting Machinery, Shafting, Iron Tanks, etc. For sale at the lowest prices by

J. HENDY, 49 and 51 Fremont Street, S. F.

MACHINE WORKS,

210 and 212 Beale Street, bet. Howard and Folsom Sts., - - San Francisco.

Manufacturer of

IMPROVED PORTABLE HOISTING ENGINES,

FOR MINING AND OTHER PURPOSES.

Also of the HAWKINS' PATENT ELEVATOR HOIST, for Hotels, Warehouses and Public Buildings.

Steam Engines and all Kinds of Mill and Mining Machinery.

Fulton Iron Works.

Hinckley, Spiers & Hayes.

(ESTABLISHED IN 1855.)

Works, Fremont and Howard Sts. | San Francisco, Cal. | Office, No. 213 Fremont St.

MANUFACTURERS OF

Marine Engines and Boilers,

Propeller Engines either High Pressure or Compound Stern or Side Wheel Engines.

Mining Machinery.

Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.

Mill Machinery.

Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores Water Jackets, Etc.

Sugar Machinery.

Crushing Rolls, Clarifiers, Vacuum Pans, Air Pumps, Concentrators, Bag Filters, Charcoal Filters, Blow-up Tanks, Coolers and Receiving Tanks.

Miscellaneous Machinery.

Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Oil Well Retorts, Powder Mill Machinery, Water Wheels.

Engines and Boilers of all kinds, either for use on Steamboats and made in accordance with the Act of Congress regulating the same, or for use on land. Water Pipe, Pump or Air Column, Fish Tanks for Salmon Canneries of every description.

Boiler repairs promptly attended to and at very moderate rates.

Pacific Rolling Mill Co.,

SAN FRANCISCO, CAL.

MANUFACTURERS OF

RAILROAD AND MERCHANT IRON,

ROLLED BEAMS, ANGLE, CHANNEL AND T IRON, BRIDGE AND MACHINE BOLTS, LAG SCREWS, NUTS WASHERS, ETC., STEAMBOAT SHAFTS, CRANKS, PISTONS, CONNECTING RODS, ETC., ETC.

Car and Locomotive Axles and Frames, and Hammered Iron of Every Description.

Builders of Steam Machinery

IN ALL ITS BRANCHES,

Steamboat, Steamship, Land

Engines and Boilers,

HIGH PRESSURE OR COMPOUND.

STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.

ORDINARY ENGINES compounded when advisable.

STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.

STEAM BOILERS. Particular attention given to the quality of the material and workmanship, and none but first-class work produced.

SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans. Also, all Boiler Iron Work connected therewith.

WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, sheets rolled, punched, and packed for shipment ready to be riveted on the ground.

HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, rivcted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.

SHIP WORK. Ship and Steam Capstains, Steam Winches, Air and Circulating Pumps, made after the most approved plans.

PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

San Francisco Pioneer Screen Works

J. W. QUICK, MANUFACTURER,

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

32 Fremont Street, San Francisco.

Books for Miners and Millmen

KUSTEL'S ROASTING OF GOLD AND SILVER ORES, and the extraction of their respective metals without quicksilver Illustrated. 142 pages. 1870. A valuable and carefully written work. Postpaid, $2.50. Published and sold by Dewey & Co., S. F.

KUSTEL'S CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for gold-bearing sulphurets arsenurets, and gold and silver ores generally, with 120 lithographic diagrams. 1867. This work is unequaled by any other published embracing the subjects treated. Post-paid, $7.50. Printed and sold by Dewey & Co., S. F.

PHILLIPS' EXPLORERS, MINERS AND METALLURGISTS COMPANION, comprising a practical exposition of the various departments of exploration, mining, engineering, assaying and metallurgy. 672 pages and 83 illustrations. A most valuable and comprehensive book of reference to prospectors and practical miners. Post-paid, $10 50 Sold by Dewey & Co., S. F.

AARON'S TESTING AND WORKING SILVER ORES.—Illustrated. 114 pages. 1876. A useful and practical work, free from technicalities and extremely serviceable for miners' use. Post-paid, $2. Published and sold by Dewey & Co., S. F.

COFF'S HANDBOOK OF MINING LAWS.—Containing the U. S. Mining Laws, Digest of Decisions, Forms, etc., 1877. Pocket size, and very handy and convenient for miners. Post-paid, $1.00. Sold by Dewey & Co., S. F.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

FRUE'S ORE CONCENTRATOR OR VANNER. Plunger Jigs. Revolving Screens. CRUSHING ROLLERS. SAMPLE GRINDERS.

SAVE YOUR GOLD!

Highly Important to Miners and Quartz Mill Men!

SILVER PLATED AMALGAMATING PLATES.

The best process yet discovered for saving fine or float gold. Extensively used with great success in gravel and quartz mining in various parts of the Pacific Coast. Over one thousand orders have been filled, and the demand is constantly increasing. Old Mining Plates bought or taken in exchange for new Silver Plated Plates. Gold extracted from old Plates at a moderate cost. Old Plates (which often contain a surplus of gold above the cost of plating) can be re-plated.

With the most extensive facilities on the Pacific Coast, orders can be filled very promptly and satisfaction guaranteed. All kinds of metal goods plated. Send for circular.

Manufacturers of

THE PATENT CHANNEL IRON WHEELBARROWS.

THE STRONGEST BARROW MADE. These Barrows are made by Superior Workmen, and of the best material. All sizes kept constantly on hand.

SHEET IRON PIPE.

Lap-Welded Pipe, all Sizes, from Three to Six Inches. Artesian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.

Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.

Office and Manufactory, 130 Beale Street, San Francisco.

SHEET IRON PIPE.

AMES CELEBRATED PORTABLE AND STATIONARY ENGINES.

THE CELEBRATED

AMES THRESHING ENGINE.

Improved for 1880. Mounted on the best Straw Burner Fire-Box Boilers, supersedes all other Engines, whether imported, or manufactured on the Pacific Coast. It embodies all the essential points and approved principles which a long experience in the field could suggest, and is particularly adapted to the requirements of threshermen and farmers. Its design is perfection—complete, compact and effective, and manufactured of the very best material obtainable. All parts are duplicated, and in case of breakage (*which does not often happen*), can be expressed to any part of the Pacific Coast on short notice. No machine shop necessary to keep the **Ames Engine** in repair, or loss of time and expense sustained in shipping to and from the repair shop.

Few men when purchasing an Engine consider the important question of ready repairs. We know of many cases of this kind where farmers were induced to purchase a new-styled Engine for threshing purposes and after a few days trial requested to express their satisfaction, which later in the season they had reason to regret, being compelled to ship to the shop for repairs at a great expense and loss of time to themselves and annoyance to farmers. No standard gauge or pattern can be observed in the manufacture of Engines or other machinery, during such time as the general plan of the Engine undergoes changes made necessary, by experiments when first introducing them. Hence their existence is entailed with such variety of changes as to make it absolutely impossible to provide extra parts to fit without taking the entire Engine to the factory, to have incorporated into it another set of new and novel ideas, which insure a speedy return for the second time to the shop.

The **Ames Engine** prior to the advent of burning straw for fuel, and ever since, has maintained its original superiority, and with recent applications of confirmed improvements to its already perfect design is without a rival—the foremost self-contained Threshing Engine in the world.

We have carefully guarded against introducing any emotional discovery or even plausible ideas, which have invariably exploded; nor could we hazard the reputation of the Ames Engine to any venturesome experiments to test any primitive notions, or jeopardize life and property while such were being made.

First, The style of fire-box or furnace ou boilers necessary to burn straw successfully resolved itself into a question—which at the time manufacturers of Threshing Engines were unable to solve—and in consequence deviated from the well-established rules which govern a skillful manufacturer in designing a safe, economical steam boiler, with the sole purpose of producing a boiler which would burn straw successfully regardless of its safety or economy. The numerous disasters with loss of life and property attending these experiments are too well impressed on the minds of the public to need repeating here. We will, however, note the causes which are directly traced to defective boilers, and exclusively confined to the boiler known as the *return flue* straw burner, which when first introduced was considered as the only boiler in which straw could be burned successfully. Subsequent experiments and brief use proved them to be the most dangerous of all boilers. After many explosions had occurred the plan of their construction was carefully inspected and pronounced extremely dangerous by the best authority on steam boilers. This decision is sustained by facts. That within the past three years during such time as they were in use, upwards of fifty have exploded or collapsed their large flue or furnace, and all precisely in the same manner and at times when least expected. The prudent farmer or thresherman will not hazard his life or property without some guarantee of safety from the manufacturer—more tangible than the mere assertion that they are *all right*, because there is abundant proof that these boilers are all wrong and extremely dangerous. The locomotive pattern of fire-box boilers is the only safe boiler in use. They have been tested thoroughly as to their effective qualities and found to be better adapted to burning straw, less liable to get out of order, and much less weight in their construction than any boiler in use.

Unsurpassed as a Combined Portable and Stationary Engine.

Baker & Hamilton,

SAN FRANCISCO, CAL.

SAN FRANCISCO, SATURDAY, MARCH 13, 1880.

VOLUME XL Number 11.

The Mining Boom.

From all portions of the great mining fields of the country we are daily receiving evidence of the rapidly increasing favor into which the mining industry is rising. The most conservative and cautious people are losing their timidity, and are embarking in mining ventures with a boldness that surpasses the operations of veterans in the same ranks. All classes of those who have any money to invest look upon mining as being paramount to all other means of increasing their capital. Neither age, sex or occupation place any bar upon the actions, in this line, of individuals. From the bootblack to the banker, through all the intermediate grades of capital; from the corn doctor to the surgeon of consummate skill; from the constructor of wheel-barrows to the builder of the most intricate steam engines; from the scullion in the kitchen to the millionaire owner of the palatial residence; and through every phase of social life, from the lowest to the highest—all are swelling the grand army of stock buyers, and becoming thereby co-partners in mining properties.

This is not to be wondered at when the rapidly increasing yield of the mines is taken into consideration. It ceases to appear like an infatuation when we meet the daily records of new and rich discoveries of mineral veins. Were not the facts substantiated by the production of million as positive testimony, it might seem that a glamour was cast by some magic spell over the entire community. But it is no transitory vision, it is no evanescent delusion—it is a fixed and permanent reality. The miner's pick is more potent now than was the magician's noted talisman of bygone ages. At its practical stroke, from the darkness of the mine it brings to light the yellow gold, the glistening silver, the bright brown copper, the more ductile lead, and the sombre-hued iron. It opens receptacles of hidden treasures, that since creation's dawn have awaited its sturdy blows to break away the casement that enclosed them. It wields more power than did the subtle spells of the alchemist eons of years ago, and transmutes the crumbling rock into bright, pure gold. It sends the unsightly ore to the furnace, from whose fusion is extracted the noble metal.

And what is more remarkable still, is the sudden and universal development of all this mineral wealth. The fields which our grandsires tilled are found to hold beneath the depth which their plowshares reached crops of such exceeding richness, that the product of a single acre would thrice fold pay the original value of the farm. The waste and barren mountains hold within their veins, crops of more value than the most fertile plains could ever produce. Nor are such instances isolated ones. Every where throughout the country, where the presence of metallic deposits were not even thought of, rich yields are extracted from the new mines that are opened. The young men who left their homes in the Eastern States to join the gold seekers of California in the days of '49, have gone back matured in years, and educated by experience in practical mining, to see even at the thresholds of the old homesteads, and under the surfaces of the old farm fields, mines that rival in richness those of the Pacific shores.

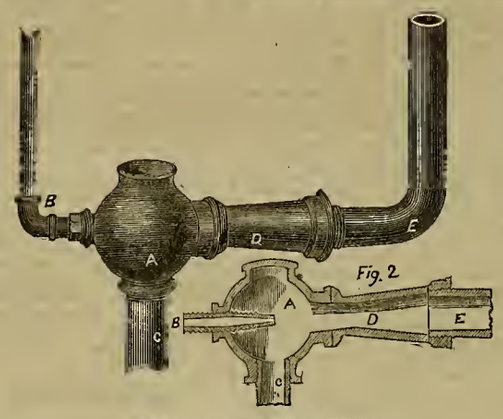
From the *Maine Mining Journal* we learn that 27 mines were recorded in January and February of the present year, the aggregated capital stock in them amounting to $13,500,000. They are yielding richly in gold, silver and copper. From the Carolinas, Virginia, Georgia and Tennessee, new developments are being made, and many old mines reworked. From the galena regions new discoveries are noted of richness in excess of all previous ones.

From New Mexico, Arizona, Colorado, Montana, Idaho, Utah, Nevada and California, the notices of strikes come so numerous and frequent that only a passing mention of the most important of them can be made. Ore containing from 500 to 2,000 ounces of silver to the ton is often reported. There are mines that are putting out from $5,000 to $10,000 per day. If the attempt were made to name all the mines that are yielding over $100 daily, there is not a journal in the United States that could find space enough in its columns to do so. With such rich strikes and so generally distributed as they are, it is evident that the mining "boom" must continue to increase both in the investors and amount invested, and in the yield from the mines that has brought it into existence and still keeps it in progress.

There is evidently a rich future in store for our country from the product of this industry. It is now receiving an impetus that will extend its production. It has not yet attained its maximum of output, and from its capabilities of producing it may safely be stated that it has only commenced to display its power of yielding treasure. If its real future could be accurately set forth now, the statement would be deemed a wild fiction or an impossible romance, and yet, that statement would not be an exaggeration.

The American Steam Siphon.

We give an engraving herewith of the American steam siphon, manufactured in this city, by W. T. Garratt & Co. *A* is the body of the siphon; *B*, the steam pipe; *C*, the suction pipe; *D*, in Fig. 1 is the reducing pipe; *D*, in Fig. 2, the throat. The operation is as follows: Steam is turned on through the steam pipe, *B*, and rushes across the globular chamber, *A*, into *D*, carrying the air into *A* and *D* before it, thereby exhausting the air from *A*. Water to supply its place rises through the suction pipes, *C*, from atmospheric pressure, as in ordinary suction pipes, when the steam jets force it onward through *D E* with a velocity proportioned to the pressure in the steam boiler.



AMERICAN STEAM SIPHON.

ANOTHER COMET.—The Smithsonian Institution has received from the Astronomer Royal of England the announcement of the discovery by Gill, at Cape Town, South Africa, on February 12th, of a comet in 8 hours 58 minutes right ascension, 12° 31′ north declination, with a daily motion of 2° 35′ in right ascension and 20′ south

An Improved Billiard Table.

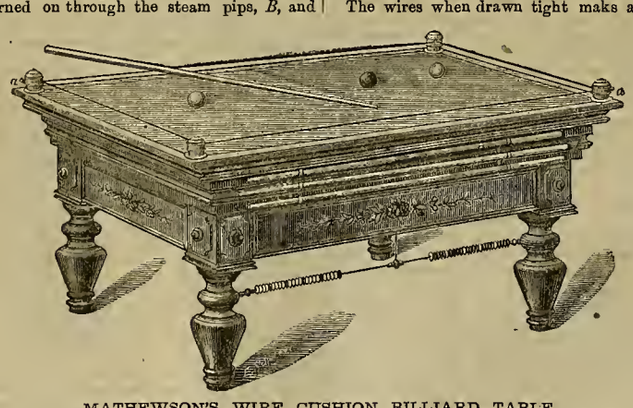
We illustrate on this page an improvement in billiard tables, for which Mr. S. R. Mathewson has recently applied for letters patent through the MINING AND SCIENTIFIC PRESS Patent Agency.

The special feature in the table is its peculiar cushion, which, instead of being solid rubber, is made of a piano wire stretched tight, the elasticity of which answers the purpose of the ordinary cushion. These wires cross each other inside the corners of the corner studs, so that the ball can never touch the studs. A very ingenious and easily arranged method is employed to keep the tension of the wires perfect, this mechanism being in two of the corner studs, so the wires can be tautened at any time.

The bed of the table is made of a peculiar composition formed in a plastic state and allowed to harden. This when smoothed off is covered with cloth in the usual way, and is perfectly solid in its wooden bed, but not half as heavy as the ordinary beds. The screw and wedge principle is applied to the leveling device on the legs, so an accurate adjustment is possible.

The wires when drawn tight make a much more elastic cushion than those of ordinary form, and the balls can be driven many more times across the table than when a rubber cushion is used. The cue can be passed under the wire when desired, so some shots are possible which cannot be made with a solid cushion.

Mathewson & Co., 28 New Montgomery street, under Palace hotel, have several different sizes of this table, some of them for children's use. The ordinary size is the same as that commonly used. The simplicity of construction enables the manufacturers to make them for a great deal less than the tables in ordinary use. The piano-wire cushion is rubber coated so the balls are not bruised, and there is no more noise than with a rubber cushion.



MATHEWSON'S WIRE CUSHION BILLIARD TABLE.

Battery and Copper Plate Amalgamation.

At the recent annual meeting of the American Institute of Mining Engineers, Prof. R. H. Richards, of the Massachusetts Institute of Technology, read a paper upon "Battery and Copper Plate Amalgamation." The paper was prepared from notes made by him during a series of experiments which have recently been made at the mining laboratory of the Institute, with a small five-stamp mill, with a view to a careful investigation of the conditions most favorable to a higher yield from gold ores than is generally obtained in ordinary mill practice. In the progress of these experiments, Prof. Richards soon found that two sources of error tended to vitiate the results. One of these sources of error, and the one to which he attaches the greatest importance, he terms the "overlapping error," which is due to the circumstance that the amalgamated copper plates require, before attaining an efficient condition, saturation with a certain amount of gold, which does not appear in the returns when ordinary scraping of the plates is resorted to. He therefore adopted the plan of using a new set of the thinnest copper plates obtainable for every experiment.

The results arrived at with two different kinds of ores—one from Canada and the other from New Hampshire—strikingly illustrated the difference of the condition of the gold. In one case almost all the gold was obtained from the plates within the battery, while very little would be gathered from the copper plates and the mercury trap. The fact that a large portion of the gold was deposited on the plates outside of the battery in the second case, proved in how finely divided a state the precious metal was in the ore. He had found, during the course of his experiments, that plates saturated with *silver* amalgam would act promptly in taking up gold, so that plates so prepared helped him to overcome the errors due to the inaction of fresh plates. With these precautions he had succeeded in saving 85% of the assay value of the ores.

In the discussion following the reading of the paper, Mr. Park, who incidentally mentioned a new process for deoxidizing copper, stated that he had found that plates free from oxygen would not take up gold. Prof. Silliman, who spoke highly of the line of experiment followed out by Prof. Richards, pointed to the experiences of mill managers in the Black Hills and elsewhere, who all recognized the fact that the first runs of a new mill are far behind the later returns—a circumstance which was undoubtedly due to the fact that the copper plates must first be saturated.

He spoke of recent practice at Bodie, where the difficulty of working ores with extremely fine gold was overcome by using a minimum of water and pumping the water back into the battery, where is was used over and over again. Mr. N. S. Keith said that a spongy condition of the plates was a necessity for good work, and explained the manner in which it was probably formed, corroborating Mr. Park's observations.

Mr. O. Heinrich, referring chiefly to the working of Southern ores, spoke warmly against the prevailing practice of fast driving of mills. He pointed, as an example of close working, to the old practice in the Tyrol, and urged the necessity of more cautious and careful stamping. It was owing to this unskillful use of the stamp mill that justice was not generally done to it.

IN San Domingo, on February 10th, an insurrection broke out in the south. Gen. Antonio Castello, the leader of the insurgents, was killed, with six companions. In the capitol 16 persons implicated in the movement were under arrest. It is expected that they will be executed. The government was master of the situation.

IN the center of the Malheur river, near the Stone house, in Baker county, Oregon, is an island 20 or 30 feet in diameter, out of which gushes hot water. The island is covered with grass, and the phenomenon is an interesting one.

AN energetic effort is being made by the leading citizens of San Francisco to stop the incendiary talk of the labor agitators.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds

Meadow Lake—Its Past, Present and Future.

[Written for the PRESS.]

The Gould Process.

Meadow Lake, like many other old landmarks in California has had its ups and downs, and fallen into decay. In its early days it prssented all the features that oharactsrizs the average miniug district on the coast. Many a sturdy miner put up his last dollar in claims and town lots, and like Sellers, in the "Gilded Age," saw "Millions in it," and eventually had cause to mentally curse ths luck on general principles that induced him to go thither. Dwellings, hotels and husiness houses sprung up like mushrooms, on the very crests of the Sierras, and their rsmains have stood since its dssartion like so many specters of its former condition.

But from prssent indications, "Richard will be himself again." Capital and intelligent lahor have again directed their attention to Meadow Lake, and its refractory and rehellious ores have to yield their treasures "to man'e relentless dominion." Your correepondent is indebted to Mr. Jamee Gould for valuable information concerning the process used hy him, and by his request makee it puhlic to the world.

The process in Truckee is known as the Gould process. Gonld does net claim this as hie private property, and any parties visiting Meadow Lake will he given every opportunity to inveetigate the process thoroughly. It is no secret, and every man owning or interested in mines there is familiar with the process. An air of mystery has so prevaded all the alleged processes for reducing these ores to euch an extent that the public have lost confidence in any and all attempts made in that direction. It is a well demonetrated fact that the hard common eense of the practical miner has done more to develop the mining industries of the coast than all the fine-spun ecientific theories of the scientist and alchemist.

Mr. Gould is a practical amalgamator, having made that his husinese for over 20 years in the different qnartz districts of California; also at the Black Bear and Klamath mines in northern Califrnia. He ie indebted to Mr. George F. Deetkin, a gradnate of Freiburg, for a large part of his euccess. I will try to give, in Mr. Gonld'e own language, his treatment of the ore. Any practical millman acquainted with quartz reduction, knowe to dry crush quartz, the ore is first dried hefore crushing. The ore at Meadow Lake ie first cruehed by a dry crushing mill, and then roasted "in a reverheratory furnace, without salt," to dead roast. The amalgamation is then made with the ordinary iron pan.

Samples of the Meadow Lake ore assayed by Prof. Price, of San Francisco, went $97 per ton. The tailings showed $2 gold and $3.50 silver per ton. Several runs were made the last eeason on rock from the Grant mine, with an eight-stamp mill which gave very eatisfactory results. One run of 13 tone from the Grant mine, milled by this eystem, produced 95% of the assay, or in the aggregate, $1,285.

From the experience of the past season Gould is satisfied the ore can be worked at a coet of $5 per ton. Some chronic doubters will say that this process may work the Grant ore, and not other ore from different lodee in the district; hut we answer them hy eaying that oree from nearly all the lodes have been worked by this process on a small ecale successfully. The ealt is the leading feature in the process. Nearly all the so-called processes have failed on account of using salt in the roasting process.

Mr. Frank Pausen, of San Francisco, a man of means, is interested largely in Meadow Lake. J. L. Lemson & Co., of Truckee, and numeroue hardy miners, with good practical experience, are engaged, and active operations will he reenmed this season and pushed vigorously. The parties interested are eatisfied that the ores can be worked and pay a handsome profit. Among the companies organized are the Carlisle, the U. S. Grant Co., Girard Center, Gazelle and Meadow Lake Con. The Grant Company have already sent a force of men to take out rock, and expect to make a run on 60 tone of rock as soon as the weather will permit. Mr. Booth, an expert from San Francisco, wae up to the district the past season, and was astonished at the simplicity and the results attained. The Grant Company have lahored under considerahle difficulty thie season, have heen at great expense in fitting up aud getting the property in rnnning order, hut they have heen successful, and Meadow Lake rock has paid the bills.

From Cisco, on the C. P. R. R., to Carlisle, the distance to Meadow Lake ie nine miles by the trail. There is a wagon road from Truckee, on the C. P. R. R., the entire distance of 23 miles. Machinery and supplies were brought in by this route the past season, and Truckee will he the depot for everything going that way; and from every indication Meadow Lake will again be one of the most flourishing mining dietricts on the coast. The district is a perfect network of quartz lodes, and a great many hona fide locations have heen made.

Mr. Gonld is entitled to oredit for his successful efforts to reduce these refractory ores to subjection. Meadow Lake ores have heretofore defied the combined attacks of the scientist and his crucihle, hut this plucky little Irishman demonstrated heyond douht that they can he worked, and worked profitahly.

Any persons visiting the district will be furnished evsry facility to investigate thoroughly; and as to douhting Phillips' and Thomas', ws say come and see. Ahout the middle of June the roads will he passahle, hut owing to snow, at pressnt it is difficnlt to make the trip.

GEORGE E. MARSHALL.

Truckee, Cal., Feh. 18, 1880.

Tellurium in Mariposa County.

EDITORS PRESS:—In looking over a lats number of your excellent paper I noticed a communication, from the pen of Prof. Joseph LeConte, on "The Mineral Known as Tellurium." Ac cording to the learned gentleman's statement, this valuahle substance is only found in a very small portion of this State, and that is in the counties of Tnolnmne and Calaveras. Now, I do not profess to he a scientific mineralogist, hut if Prof. Le Conte will extend his ohservations to Mariposa county, I will guarantee to show him plenty of mines the ore of which carries quite a percentage of genuine petsite tellurium; which in return yields from 40% to 45% in gold. But it must not be expected that a sulphuret carrying such a large percentage of the preciove metal is found in large masses like the sulphurets of iron, galena, and others too numerous to mention.

The telluridee of gold are ahout as scarce as the gold itself, and I have always noticed in working in a mine which has any tellurium. that when the ore is rich in gold it is likewise rich with the other mineral. Perhape just at the present time the Virginia mine, located on the mother lode, three miles southeast of Coulterville, is the richest mine we have in this county in tellurium. At any rate the average assay of the ore is from $800 to $1,000 per ton.

Then we have the Eureka, Compromise, Bandareta, Scanlan, Hasloe, Mary Harrison, Furgerson, Hite, Pine Tree and Princeton mines, in all of which the ore carries more or less tellurium. The Princoton mine is one of the richest in this county, having produced $3,500,000 in 700 feet of depth; and whenever the ore was paying from $40 to $200 per ton in gold, it wae very rich in tellurides. The Hite mine, down now ahout 800 or 900 feet, and which has been worked continuously for the last 18 years, has produced at least $2,000,000, and in this there ie more or less tellurium in the quartz. Four miles from the latter, and on the eame range, ie the Furgerson mine, which has heen worked for the last 16 years, and is down 700 feet. It has made the original owners rich, and the ore carries tellurium from surface oroppings to the hottom of the eump. The Washington mine, near Hornitos, is the deepest one we have in this county, being down 1,200 feet. It has paid its regular monthly dividend for years, and is improving in depth; has had tellurium from top to hottom.

Suffice it to say that every deep mine in thie county which has paid its way from the surface croppings down to the present workings, has what is termed tellurium in the ore. We are etrongly of the opinion that tellurinm is to he found, in eome form or other, in every rich gold quartz mine in this State. In eome mines the tellnrides may be so thoroughly hlended with the other sulphnrets as not to be distinguishable nnder an ordinary fire assay, for it is of euch a volatile nature that, in order to get a correct test, the ore must he worked with great skill, and assayed for the tellurium alone. It is only within the last decade that it has attracted much attention for the gold it contains, and hence it is that so few miners know anything about it, or know it when they see it.

S. RUDOLPH.

Feh. 24, 1880.

A FINE MINE.—The Carson *Appeal* furnishes the following little hit of satire: Gen. Batterman, Superintendent of the State Prison mine, furnishes the following encouraging report: He has now 143 men at work on ore level and taking out the finest quality of rock. There has in fact heen no change in the appearance of the formation since his last report. Car eamples show high assaye of granite of the best quality, and the experts believe that they are in as fine a hody of huilding rock as can be found in the State. Little or no water is encountered and the pump ie running at ahont ten strokes per day. The tunnel, opened hy some parties who were anxious to drift off into California and New Mexican ground (to visit some relatives), has been closed np, as it was encountering an unfavorahle formation of wardene and ehotguns. The cages are all in good order and furnished with excellent eafety catches. The ventilation in the lower level of the prison floor has been somewhat improved by an upcast winze connecting with the roof. By the next visiting day they expect to show eome good work in the north drift. There ie still room for a few more men on the day shift. Applications for work can be made Judge King, of the District Court, or Sheriff Hill.

The Richmond Mine.

An exchange speaks as follows of the Richmond Con. mine at Eurska: The Richmond, of this district, is perhaps the greatsst mins in ths world to-day. The developments of ths last six months are simply marvelous. It is no secret that the mins is looking hettsr, at the prssent time, than ever hsfore in its history. From the 200 lsvsl along down to a point far hslow the 600, thers is such a mass of choice ore as was never disclosed, to our knowledge, anywhere in any mining property in the United States, not excepting the celehrated Big Bonanzas of the Comstock, which yisided to their fortunate shareholdsrs such fahulous returns as to practically glut and depreciats the silver markets of hoth the old and the new world. The Richmond honanza has a demonstrated depth of over 400 fset, and at such points as crosscuts have been run, it is shown to have a width of more than 200 fset; that is to say, they have a column of ore approximating 500 fest in hight hy 200 fest in width. How much deeper it goes no man can foretell, though thers is every indication that it extends into the earth indefinitely. It is a peculiarity of ths ore hodies of Ruhy hill that they terminate in immense heds, the first sections of the chute heing merely the stem of the pear, as it were. Should this theory hold good in the present instance, and there can hs no douht that it will, the Richmond bonanza must widen into acres of good ore when a sufficient depth shall have heen attained. This portion of the mine being comparatively virgin ground, there is no estimating the great value of the development now progressing with such satisfactory results at every stroke of the pick, for, if we are correctly informed, every day witnessee a marked improvement. The ore, too, is of a much higher grade than has hitherto ruled in the minee of Ruby hill, running on an average, say, $80 per ton. The body, as a whole, is also freer of waste material than usually obtaine. The Richmond is, in a word, a grand mine, whose unparalleled promise and value can scarcely be computed at this writing. There is ore enough in sight to run the furnacee at their fullest capacity for more than two years, without the development of another ounce. Where is the next mining property on the face of the glohe in whose favor as much can be said?

The future of thie magnificent property cannot be too highly appreciated by the people of thie community, guaranteeing as it does permanency and prosperity to every interest here dependent npon the mining industry. Director Prohert, Manager Rickard and Foreman Longley are also to be congratulated on their excellent management and the hright prospects of the company. These gentlemen, in their respective spheres, have ably and sufficiently promoted the success of those whom they so faithfully represent.

The Mineral Riches of Japan.

The Japanese have now a completely organized geological survey, somewhat similar to our own, with a full etaff of native eurveyors, under an American chief, Mr. B. S. Lyman. The first report of progress of thie survey, for 1878 and 1879, has just been published, and contains eome accurate and valuahle information on the mineral wealth of the country. Mr. Lyman describes a survey journey which he made with some of his etaff from June, 1878, to February, 1879, extending over a dietance of 2,800 miles. Mr. Lyman reckons that the coal fields of Western Japan contain abont 620,000,000 tons, and if one-third be deducted for the working, there will remain 400,000,000 tone, representing a value at the cost of $1,000,000,000. Inconsiderahle as this ie in comparison with the large and rich coal fields of other lands, it is quite equal in value to all the metal products together, except iron. The copper of all the workable mines ecarcely reaches the value of $750,000,000; the 8 or 10 gold and silver mines, which were formerly worked and may be eo again, may, including the lead, antimony and tin mines, the workability of which ie doubtful, be valued at not more than $250,000,000. On the other hand, the value of the iron amounts to at least $250,000,000,000, or 250 timee more than that of the coal. The relative importance of the mineral products of Japan (excluding Yesso and the small coal fields of Kii, Ise, and Iwaki) may be represented hy the following numbers: Iron, 1,000; coal, 4; copper, 3; and all other metals (chiefly gold and eilver), 1. The total value of these products reachee the sum of about $252,000,000,000—*i. e.*, just as much as the coal fields of Yesso, which in other respects is eo poor in natural products. Mr. Lyman gives some details concerning 24 of the hot springs in Shimotsuke, Iwashiro, Uzen, and Ugo, and a table of the petroleum eprings of Japan, according to which hy far the most numerous and most productive are in Echigo and in Akita Ken, and the total delivery in the year 1879 was 4,525 gallone per day.—*London Mining Journal.*

UTAH has 285 stamps for crushing ore, thns distrihuted in the different mining districts, viz: Beaver, 20; Bingham, 40; Camp Floyd, 20; Hoinansville, 10; Ophir, 10; Park, 80; Silver Reef, 38; Stockton, 13; and Tintic, 52. The 285 stamps are in 19 miles, including five in Silver Reef, three each in Tintic, Park and Bingham, and one each in the others. There are also 23 etacks for reducing smelting ores, hut not more than a dozen run regularly. At several places silver is extracted by leaching.

The Corundum Mines of North Carolina.

The name "corundum" is applied to all crystallized alumina. It is the hardest mineral in the world, except the diamond, and whsn in ths crystalline form and transparent constitutes the Oriental gems, the sapphire, ruby, emerald, topaz, etc., which are of great value, some eveu exceeding the diamond, hecanss they aro mors rare. It is used for ahrasive purposes, hut as yet a sufficiant quantity has nevsr heen found in this country to taks ths place of emery. It is much hardcr than emery, performing the work in less time.

Corundum occurs in ths great chrysolite helt extsnding from the southern part of Virginia to middls Alahama, passing in a southwestsrly direction through the mountainous portion of North Carolina. Iu the southwestern counties in ths Nantahala range of mountains (one of the spurs of the Blue Ridge), and lying on either side of Buck creek (a trihutary of ths Tennessee), at an elsvation of from 3,000 to 4,000 feet, is the so-called Cullakenes corundum mines, which has heen considered the largest dsposit of corundum in this country. It covers an area of 300 acres. This mine was purchased in April, 1879, hy Herman Behr & Co., and has heen worked since May, with what success is not reportsd.

In Macon county, N. C., on the western slops of the Blue Ridge, at an elevation of ahout 2,500 feet, is Corundum hill, formerly known as Cullasagee mine. This mine was discovered in 1872; it was afterwarde purchased by E. B. Ward, and worked for 18 monthe hy Col. C. W. Jenke, of Boston. Rumor eaye that gems of exceedingly great value were taken out. In July, 1878, this mine wae purchased by Dr. H. S. Lucas, for the Hampden Emery Co., of Chester, Mass. They commenced mining August 20th, and up to the present time have taken out 200 tone of corundum; also, in washing some of the dumps left there when worked by Col. Jenks, were found many fragments of the Oriental gem, perfectly transparent and of very great hrilliancy. Among these is an emerald weighing 30½ carats, and eeveral ruhies of the finest color.

In the eastern part of Jackson county, N. C., at the foot of one of the highest peaks of the Blue Ridge, is what is termed the Hog Back mine. Thie mine was operated for a limited season by the Hampden Emery Co.

Northweet of the Pigeon, in Heywood county, N. C., is still another deposit of corundum, called the Presley mine, which has been worked since one year ago last March.

In Madison and near the Buncombe county line, in the eame State, is an outcropping of chrysolite, carrying corundum, which covers an area of 75 acres, and has heen worked for the Hampden Emery Co. for the past scason.—*Scientific American.*

A Lucky Fall.

The Sonora *Independent*, says: The most singular mannor of heing struck with a fortune in prospecting that we ever heard of occurred ahove Spring gulch on Sunday last. Mr. Snow, late of San Francisco, now prospecting in this vicinity for other parties, was out on a quartz hunt with Dr. Drake, of San Francisco. They were returning home, it heing stormy, when Snow (who was riding a horse along the trail) was suddenly missed hy his companion. Snow'e horse had slipped off the bluff, and down he went at an angle of 45°, horse, rider and rifle (which he grippled firmly in his hand), rolling over and over in the enow, nntil he brought np against a mase of stone etanding out of the snow, its top covered with moss. He was not hurt ae the cold, soft cushion had saved his bones from the hard ground beneath. Scrambling up against the rock, he noticed that it was quartz, and where the horse had accidentally kicked of the moss something glittered. His eyes "hugged" out, but he did not etop to hrush them off, his hande were too husy clawing off the moss. Darkness coming on he had only time to hreak off a few specimene, which are filled with pure ore. One small piece, exhibited in town, was estimated to he three-quarters gold. Tone of it are apparently etill awaiting its owner. Snow says the vein is about 30 feet thick, and in his impnleive generosity he gave away several ehares eon after his arrival. He told us that he "would not look at $25,000 for his interest." It ie without doubt the richest mass of quartz ever discovered in thie county, except the Divoli honanza, recently opened here in Sonora. Of course, he told us to keep it ont of the paper; hut the caution we find to he getting monotonous. Mr. Snow is very well known in San Francisco as an actor of merit, and a gentleman well-deserving the good fortune he has "tumhled to." Some men are born rich, others have riches thrust upon them, bnt Mr. Snow has drifted through air and snow, right slap up against a pile of richness that would make old Rothschild'e keen eyes turn green with envy.

SUTRO TUNNEL.—February 22d was measnring day. The south header is not running. The north header was then 644 feet from the parallel of the C. & C. shaft. The north lateral runs 100 feet west of the C. & C. shaft and the distance from the end of the curve is 2,738.378 feet. This curve adds 25 feet to the length of a direct line to the center of the tunnel, making the north header at the time of the measurement a little over 2,179 feet in length, and carrying it some 66 feet into Con. Virginia ground.

MECHANICAL PROGRESS.

New Process for Making Bessemer Steel.

A new process, invented by Mr. Jacob Reess, of Pittsburg, is thus described:

In order to properly explain the advantages of the new process, it should be remembered that the iron *per se* is of the same quality wherever found or by what process produced. The different qualities of iron known as pig metal, cast iron, wrought iron and steel, are covered by foreign matter, which accompany the ores or has been incorporated with the metal in its manufacture. All processes employing different agents produce different results; hence the Catalon process produced the charcoal bloom iron; Cost'a process gave us the puddled iron; the cementing process gave us German steel; Huntsman'a process gave us crucible cast steel; Bessemer gave us Bessemer steel, and more recently the open hearth process gives us a still different quality of steel.

The Bessemer and open hearth process appeared at first to threaten the extinction of all processes except the blast furnace, but in practice it was discovered that neither of these processes was competent to eliminate phosphorus from the iron; and not until the Bessemer patents had expired was this difficulty practically removed. Now, by the use of my dephosphorizing process, all grades of metals may be converted into iron or steel, both in the Bessemer converter and in the open hearth.

In practice it has been found that, while the Beasemer process is best adapted to produce rails, etc., the open hearth process produced soft steels to the best advantage. In the present ordinary open hearth practice, and for which I hold the patent in this country, it requires eight hours to convert pig metal into steel. The first six hours and a half is consumed in decarbonizing the metal. By the new process I am enabled to decarbonize the metal in ten minutes, thus shortening the time consumed by the open hearth process 80%. In producing soft steel by the open hearth, the high heat required to decarbonize the metal was very destructive on the furnaces. Now, by the new process, the metal is practically decarbonized and desiliconized before it gets to the furnace, and as a result soft iron or soft steel will be produced cheaper than steels high in carbon. The process is especially adapted to the requirements of the merchant trade, as different grades of iron or steel may readily be produced to fill orders in such quantities as may be required. The plant may be constructed to produce 100 tons.

Friction of High Velocities.

The subject of friction at high velocities, especially with reference to the friction of hearings and pivots, of brakes, etc., is one to which much less attention has been given than the importance of the matter seems to demand. Very meager reports have been placed upon record even of the work that has been done. Moreover, what has been written, as bearing upon the subject, has been chiefly negative, so far as relates to this particular question; and much of what has been done is mostly inapplicable—on account of difference of conditions—to the ordinary work of the mechanical engineer. At a recent meeting of the English Institute of Mechanical Engineers a committee was appointed to make special research as to what has been done in this direction. We copy the following paragraphs from the report of that committee:

A difference has long been recognized between what has been called static friction, or the friction of rest, and dynamic friction, or the friction of motion, the co-efficient in the former case being, in many instances, much higher than in the latter. The recent experiments of Prof. Fleeming Jenkin in conuection with this matter, although made at the opposite end of the scale of velocities to that about which the committee is now chiefly concerned, have great interest in connection with the general question of velocity and friction. By experimenting at extremely low velocities, he has shown that in certain cases, where there is a very marked difference between the two co-efficients mentioned, the co-efficient of friction decreases gradually as the velocity increases, between speeds of 0.012 and 0.6 feet per minute; and his experiments indicate a probability of a continuous rather than a sudden change in the value of the co-efficient between the conditions of rest and motion. In cases where there is little or no differences between the co-efficient of rest and motion, no difference was found at the velocities between which he experimented. His experiments were made with a very small steel spindle of 0.1 inch diameter only, resting in rectangular V notches, the pressure being constant, and due to the weight (86 pounds) of a disc carried by the spindle, and revolving with it.

Prof. A. S. Kimball has also made a number of experiments upon the question of velocity and friction. At common, but somewhat slow speeds, he finds the friction between pieces of pine wood to decrease rapidly as the speed increases. With a wrought-iron shaft of one inch diameter, working in a cast-iron bearing well oiled, an increase of velocity of rubbing from 6 to 110 feet per minute caused the co-efficient of friction to fall to 0.3 of its first value. The pressure in this case was about 67 pounds per square inch. Other experiments on lubricated journals at smaller pressures gave a diminution of the co-efficient from 0.15 to 0.05, as the velocities increased from 1 to 100 feet per minute. At such low speeds as from 0.59 to 2.2 feet per minute, a similar decrease was found; while at the still lower velocities of from 0.002 to 0.01 feet per minute, the friction *increased* with the velocity.

Prof. R. H. Thurston has carried out a number of experiments to determine the effect of changes, not only in velocity, but also in pressure and temperature, upon the fractional resistance in lubricated bearings. His conclusions are that the co efficient at first decreases, but after a certain point increases with the velocity, the point of change varying with the pressure and the temperature. At a pressure, for instance, of 100 pounds per square inch and a temperature of 150° F., the minimum value of the co-efficient is reached at a speed lying between 100 and 250 feet per minute; while at the same pressure, but at a much lower temperature (apparently) the value of the co-efficient increases continuously from 30 feet per minute, the lowest velocity tried, up to 1,200 feet per minute. As the general result of his work, Prof. Thurston has come to the conclusion that for a cool and well-lubricated bearing the co-efficient of friction increases with the velocity, and approximately as its fifth root, at all speeds exceeding 100 feet per minute. It is much to be regretted that Prof. Thurston has published no information about his very important experiments, in this part of the subject, except a few table of epitomized results. Neither the sizes of the journals tested, the number of tests made, nor any particulars as to the variation of the experiments among themselves are given, and very few details as to the way in which they were carried out. Until this information is made accessible (as it is to be hoped it will be made) it is not easy to estimate the degree of importance to be attached to these results.

A NEW METAL FOR JOINTS.—According to the *Colliery Guardian*, Messrs. J. B. Spence & Co., of London, Manchester and Glasgow, have invented what they term "a new metal for joints"—a thing that has long been felt to be needed, especially by gas and water companies, and others who have much to do with jointings, particularly iron to stone or wood; a metal which is to supersede lead for jointing water or gas pipes and filling up holes in defective castings. It is run into the joints in the same way as lead, but without caulking, it will produce an hermetically-sealed joint, and the patentee claims for his invention the advantage of the metal over lead, inasmuch as it will stand a pressure of 500 to 800 pounds; that a joint is made in about one-fifth of the time usually employed; that it is not affected by aqueous or atmospheric action; it can be used over and over again without losing any of its qualities; and that it is free from poisonous substances; and, not being acted upon by water alkalies or acids, may also be used for lining cisterns for domestic and other purposes. It can also be used as a substitute for lead in its application to industrial and artistic purposes. There is certainly one very great advantage which this metal has over lead, namely, its cheapness, which the patentee states is one-third of that of lead—an advantage which will certainly recommend itself to economists. We are not advised as to what this substance is.

INTERESTING FACTS.—Prof. Gore, in 1869, and subsequently Prof. Barrett, in 1873, drew attention to certain anomalies that occurred in the expansion and contraction of iron wire; and in 1877 Prof. Norris published the result of his experiments on the same subject, which appear to confirm Chernoff's theory in a remarkable manner. In cooling a strained iron wire from redness, it was found that the contraction due to cooling was, at a certain point and for a limited period, changed into action of elongation. In good iron wire this irregularity could not be detected, but in hard wire and steel it was very apparent. The wire has to be raised to a very high temperature before the temporary elongation during cooling can be seen; and it does not take place if the wire is heated only just beyond the temperature at which it occurs. Prof. Norris' researches have led him to the conclusion that in steel and in iron containing free carbon, there is a contraction of shortening which is excited by heat and which proceeds simultaneously with the dynamical expansion and masks its true amount. This is divisible into high and low temperature contraction.

LUBRICANTS.—The choice of a lubricant is frequently ill made. Common kerosene oil is too often injudiciously used in place of a thicker or more bland oil, because the heat produced by friction rapidly vaporizes the oil and leaves the journal dry. Crude petroleum for the same reason is fitted only for very slowly-revolving journals, such as water wheels. For very heavy machinery, or for gearing, tallow and black lead rubbed up together is the best lubricant, and is also the best for wagon and carriage axles during the hot weather. For light-running machinery, sperm oil is the best; good olive oil that has not become rancid and acid, is perhaps the second best, and for winter use lard oil is excellent, but is rather too drying to be a first-class lubricant. Castor oil is better for axles in the winter, and black lead with it is a help at any time.

SCIENTIFIC PROGRESS.

An Immense Meridian Arc.

The Geodetic Junction of Europe and Africa Effected.

On examining a map of Europe and considering the numerous geodetic operations that have covered the British islands, France, Spain and Algeria, one readily sees how desirable it is to connect the system of triangles into one whole, reaching from the northernmost of the Shetlands (61° latitude) to the great desert of Africa (34° latitude.) It is gratifying to know that Spain and Algeria have been lately brought into geodetic connection, so that science now possesses a meridian arc of 27°, the greatest hitherto measure on the earth, and projected astronomically on the heavens. This important work was undertaken by the governments of France and Spain, and has been carried out under the direction of Gen. Ibanez and M. Perrier. Preparations for it have been going on for several years. Four mountain hights were at length selected for signaling operations, viz.: Mulhacen and Tetica in Spain, (the former being the highest in that country), and Filhaoussen and M'Sabiha, between Oran and the frontier of Morocco.

It was decided not to trust alone to solar signals, but also to employ the electric light at night, and the event fully justified this resolve, for the solar signals totally failed, being seen neither in Spain nor Algeria. The difficultiss of the enterprise, then, will be obvious on consideration, for to produce the electric light with sufficient intensity it was necessary to have recourse to electro-magnetic apparatus driven by steam engines, and the problem was that of hauling up Gramme machines, engines of six-horse power and various instruments to summits of 1,000 to 3,550 meters high, making roads on these desert mountains, organizing supplies of water and fuel, and finally providing accommodation and sustenance at each station for 30 to 100 men and 15 or 20 beasts.

The time open for operations was short, between the intense heat and early snows. On August 20th, all were at their posts—Colonel Barraquer on Mulhacen, Major Lopez on Tetica, Captain Bassot on Filhaoussen and M. Perrier on M'Sabiha. But in vain were solar signals sent by day, and electric by night; the vapors from the Mediterranean proved impervious to the beams. At length, however, on September 9th, after 20 days of feverish expectation, M. Perrier perceived the electric light of Tetica, visible sometimes to the naked eye, like a round reddish disk, as bright as *a* in Arcturus, which appeared near the horizon. On the 10th he perceived the electric light of Mulhacen. The Spaniards also perceived the French signals and a period of definite observation was entered upon extending from September 9th to October 18th. The geodetic junction of the two continents was at length realized. The numerical results arrived at with regard to those four immense triangles of some 70 leagues length of side are given in a communication by M. Ferrier to the French Academy, and are shown to have satisfactory accuracy.

Scientific Farming Practical.

Mr. Buckmaster, before a well-attended meeting of farmers, held at Tadley, in England, the other day, to consider a scheme for teaching the science of farming, said that there was no opinion more deeply ingrained in the mind of the English farmer than the belief that there was some antagonism between science and practice. Some even went so far as to say that the two are incompatible. The farmer who drains his land or tries a new manure, or a new machine, or a new crop, calls himself a practical man; he despises all experiment, and laughs at the teaching of scientific men. He is not conscious that when he is thinking over new plans and adopting new methods of cultivation he may be illustrating in his daily work a series of chemical and physiological experiments of extreme complexity and importance. Men of the highest order of intellect, and whose researches were the most original, have been practical men. Practice and theory are but phases of the same form of thought. The practical farmer, if he ever permits his mind to rise above the traditions and empirical rules of his forefathers, and asks, "Could not that have been done in a better and more perfect way; would not this be an improvement?" becomes a theorist, and when he tries to realize these conceptions, he becomes a practical man.

Theory and practice are inseparable in every art, however much men may seek to disunite them. The most practical man is often the most theoretical. Every operation is with him a theory. He recognizes no change; he will admit of no trial or experiment, because that would be an acknowledgment of science. Every science is built up of principles, and these principles carried into work are called practice. There is the science of astronomy and the art of navigation; the science of geometry and the art of land measuring; the science of mechanics and the art of making machinery; the science of chemistry and the art of agriculture. Almost every science is the basis of a cognate art. The most obvious and natural way of arriving at a real knowledge of the art of agriculture would be to know something of those principles on which the art is based, are being nothing more than the application of principles previously acquired. A farmer who is able to unite a perfect mastery of principles with a knowledge of practical details is an educated and scientific farmer. It might reasonably be inferred that the shortest and easiest method of learning any industrial art, and the surest guide to new discoveries in the art, would be a knowledge of those fundamental principles upon which the art was based. No amount of practical skill and experience could ever replace the want of scientific knowledge in farming.

THE AIR IN SEA WATER.—It is only in recent years, and through the well-equipped expeditions that have been engaged in exploring seas, that the question as to the amount and composition of the air in water has been systematically treated. Important researches of the kind were carried out by Herr Jacobsen on the *Pomerania*, in the Baltic and North sea; one result of these being that the proportion of oxygen in the air of surface water was found pretty constant between 33.64% and 34.14%. Again, Mr. Buchanan, of the *Challenger* expedition, found it to vary between 33% and 35%, the largest proportion being in the neighborhood of the South Polar circle, and the least in that of the trade-winds. A new study of the question by Herr Svendsen and Herr Tornoe, in connection with Norwegian expeditions to the sea between Norway, the Faroe islands, Iceland, Jan Mayen and Spitzbergen, has recently appeared. In some respects former methods of procuring the water and of analysis were improved on, and laboratory experiments were made as to the absorption of air by sea water. These observers got higher numbers in the surface proportion of oxygen than were obtained for the North sea; thus, south of 70° latitude the average was 34.96%; and between 70°, and 80°, 35.64%, instead of 33.93%. This corresponds, however, with what Mr. Buchanan met with in the latitude of the Antarctic circle, viz: 35%. It appeared, further, that the oxygen in the surface water was always considerably greater than as found by laboratory experiment; so that, apparently, it does not depend alone on pressure and temperature, but also on some still unknown causes.

A NEW WAY OF STUDYING SOUNDS.—The London *Times* reports that a new and simple way of producing colored rings, which seems capable of some interesting applications, has been recently brought to public notice by M. Guebhard. A saucer filled with not very pure mercury is all the apparatus required. Then clear off with a piece of card or paper the thin pellicle of oxide and dust, breathe on the bright surface, and a magnificent system of colored rings is given by the film of condensed moisture then formed. Instead of four or five "irises" described by Newton, six or seven can be well made out, and the thickness of the film increasing from the border inwards, the order of hues is reversed. Still better effects can be got by dropping volatile substances (as petroleum oil) on the mercury surface, instead of breathing on it; but the most remarkable results are had with the collodion. Diluted with ether, this gives pellicles on the mercury, which may be detached (after their thickness and colors have been regulated at will) and transferred to paper. M. Guebhard has utilized these effects in study of the sounds of the voice. Vowel sounds uttered above the moistened mercury surface produce characteristic ring figures which throw new light on the nature of the vibrations involved. The vibratory state, indeed, for vowel sounds, appears to be often very complex, the figures presenting groups of several ring systems, indicating several centers of percussion.

RECENT PROGRESS IN MICROSCOPY.—At the second annual reception of the New York Microscopical Society, February 7th, the retiring President, Mr. J. D. Hyatt, gave a brief account of the present condition, prospects and recent progress of microscopy. After referring to the success of the Continental makers of objectives years ago in attaining a certain mediocrity in the manufacture of lenses, Mr. Hyatt said that of late they have been altogether distanced in optical science by English and American opticians. The principal feature of advance during the past year was the celebrated Zeiss oil-immersion objective. The greatest success in micrometer manufacture of recent years was credited to Prof. Rogers, of Cambridge, who, by means of a complicated instrument constructed by himself, has been enabled to lay off lines upon a glass slide at distances apart of one one-hundredth and one one-thousandth of an inch with such accuracy that the deviation is less than one one-millionth of an inch.

PENETRATIVE POWER OF THE ELECTRIC LIGHT. Some time ago we mentioned an experiment with the Maxim light made at Saratoga, N. Y., to test the distance at which the electric light would illuminate a given spot, and it was found that a concentrated beam carried seven miles furnished enough light to read by. A more crucial test of the great penetrating power of the electric light is furnished by the experiments of the officers of the French-Algerian Triangulation Service, who recently saw the electric light from a distance of more than 164 miles. This observation is proof, if proof were wanted, of the great value of the light for maritime purposes, when it is exhibited from sufficiently elevated positions.

Mining Share Market.

Stock operators appear to deem it moro prudent to await botb the adjournment of the present Legislature and the decision of the higher courts upon points of legal status as regards mining and stock transactions. There is so mnch nncertainty as to what is the law, and what is not constitutionally legal, that our clephants of the stock boards dare not venture upon tbe frail structure wbich sbould bridge over tbe gulf hetween inertia and activity. In the meantime they are manipulating for a tithe of their needed bread and bntter, which they find in very thin slices and very lightly spread. The fluctuations in prices have not been morc than sufficient to cover the commissions for selling, in some oases not even sufficient for that.

At tbe annual meeting of the Hale & Norcross mining company, the receipts were announced as $346,067.74 and the disbursements, less cash on hand, as $289,475.26. Of the receipts $319,276 wore from tbe three assessments levied during the year, but we see no mention of anything from any ore. The disbursement for labor and salaries amounted to $110,858, so the mine did some good in that line if it didn't pay any profits to stockholders.

At tbe annnal meeting of tbe Potosi mining company, the receipts as announced were $118,-$12 and tbe disbursements $149,156, leaving an over-draft of over $30,000.

Bullion Shipments.*

Since our last issue, we have noticed tbe following bullion shipments :

Alexander, Feb. 23, $3,532.65; Feb. 25, $2,-147.23; Feh. 27, $2,795.96; Standard Con., for February, $84.579.26; Mar. 1, $22,189.98; Bodie Con., for February, $27,743.86; Mar. 1, $6,-230.20; N. and S. Neonday, for Febrnary, $18,-796.30; Richmond, Mar. 2, $16,692.95; Mar. 6, $19,178.11; Eureka Con., Mar. 2, 2 days, 74,404 lbs. ; Mar. 3, 29,460 lbs. ; Mar. 5, 30,640 lbs. ; Wells, Fargo & Co., at Eureka, Mar. 2, $2,100; Mar. 3, $1,800; Mar. 5, $1,000; McCormick & Co., received Mar. 1, $3,050; Mar 2, $4.050; Mar. 3, $8,450; Mar. 4, $7,950; Mar. 5, $4,450; Ontario, Mar. 1, $8,-758.40; Mar. 2, $3,059.86; Mar. 3, $3,313.29; Idaho, for February, $23,700; Silver King, for February, 52,700 lbs.; Paradise, Feb. 29, $4,-100; Mar. 7, $4,139.81; Stormont, Mar. 2, $6,-943.04; Ontario, Mar. 4, $3,392.11; Northern Belle, Mar. 1, $6,362.99 ; Mar. 2, $5,273.91 ; Mar. 9, $6,728.29; Ophir, Mar. 2, $14,205.80; Christy, Mar. 5, $3,545.27; Mar. 9, $6,952; Barbee & Walker Co., Mar. 5, $2,049.67; Stewart No. 1, Mar. 6, $8,000.

*Desiring to make our list of Bullion Shipments as complete as possible, we will be tbankful to receive from mining Superintendents and Secretaries notice of all bullion shipments from their respective mines.

PERSONAL.—Mr. J. S. Pbillips, M. E., for many years a resident of tbis city, left for New York this week, where he will reside in the future. Mr. Phillips bas desired us to express thanks for past favors from his numerous widely-distanced patrons duriug a residence of thirteen years on the Pacific coast. He will establish himself in New York in a similar business to that conducted herc, examining and reporting on mines, assaying and instructing in assaying. Mr. Pbillips is the inventor of a number of conveniences for assaying, etc., in the field, and the author of that eminently practical work "Tbe Assayers', Miners' and Metallurgists' Companion," of which a new edition has just been printed. He may be addressed for the immediate present at the postoffice, New York.

THERE is at present $45,000,000 wortb of gold bullion in the New York Assay Office.

ALL danger of general starvation in Ireland now seems to have passed.

MINING SUMMARY.

The following is mostly condeosed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

CAVED.—*Ledger*, Mar. 6: On Monday, a large cave occurred at the Amador Gravel Co.'s claim, two miles east of Jackson. Capt. Bluxome, W. Naylor and another man were working on the claim at the time. The bank upon which they were operating with the giants, is 100 ft. high. All of a sudden the bank slipped from its moorings, some 130,000 or 140,000 ft of gravel being displaced. The two giants were covered with the debris to the depth of 13 or 14 ft. The men had a narrow escape but managed to get through without a scratch. A strong stream of water was turned on, and the giants were uncovered in a few hours, and hydraulicing was again in full force.

BUTTE BASIN. The gravel is said to be of an ordinary character, not remarkably rich, but the tendency is to improve as the deposit is penetrated.

CON. AMADOR.—The Con. Amador company have put on quite a number of new hands lately. The 40-stamp mill is running to its full capacity.

MONO.

KING BER.—Bodie *Free Press*, Mar. 6: Sinking the shaft will be continued to the 300 level, when a station will be opened and crosscuts and drifts started for the company's ledges. In the tunnel on lode No. 2 the ledge is improving and becoming more solid.

STANDARD CON.—The shaft is down 803 ft. The crosscuts, east and west, 700 level, are making excellent progress. The north drift, from the east crosscut, 500 level, is in 71 ft. The ledge in this drift is three ft wide of good ore. The south drift, 385 level, has a total length from the main east crosscut of 382 ft. The ledge here is two and a half ft wide, and is looking well. The upraise from this drift has reached a hight of 52 ft, where the ledge is three ft wide of very rich ore. The upraise on the Cook ledge 56 ft shows a vein four ft wide of good milling ore. Upraise No. 2, in the north drift, is up 82 ft. The ledge is four and a half ft wide, and looks well. The north drift on the east ledge, 300 level incline, is in 187 ft. The ledge in the face of this drift is two and a half ft wide, of good average ore. The south drift from the west crosscut, 300 level incline, has a total distance of 200 ft. The ledge here is three ft wide, and looks well. The north drift, 550 level, is in 95 ft, with a ledge in the face of the drift four ft wide, of good milling ore. In the north drift, 385 level, the ledge continues to hold out in size, as well as in the quality of the ore extracted. The West Standard ledge is about four ft wide, of very rich ore. The ledge in the Gilden stopes is four and a half ft wide, and looks well.

BULWER CON.—The north drift on the Ralston ledge is in 80 ft. The ledge is three ft wide of good ore. The south drift is in 82 ft. The ledge is two and a half ft wide. The north drift on the Stonewall ledge is in 90 ftfrom the winze. The ledge in this drift is about two ft wide, of good ore. The north drift on the Stonewall ledge is in 88 ft. The ledge is two ft wide and looks well. The stopes continue to look well.

SUMMIT.—The north drift, 530 level, is in 118 ft. The ledge is about two ft wide. The south drift is in 129 ft. The ledge is about two and a half ft wide, and looks well. An upraise has been started 97 ft south of the shaft to connect with the 450 level of the Standard mine. The upraise is up 10 ft, where the ledge looks about the same as in the drift.

TIOGA.—The main shaft is 803 ft in depth. The bottom shows seams of quartz. In east crosscut, 620 level, the face shows seams of quartzite mixed witb porphyry. Upraise on vein No. 3, from 520 level, is up 139 ft. The walls are four ft apart, very hard and regular.

ORO.—The main shaft is 71 ft below the first level. The west crosscut, tunnel level, is in 205 ft, 14½ ft of wbich is quartz of a lively character, heavily charged witb sulpbides carrying gold and silver.

BOSTON CON.—On the 200 level the drift bas been run on tbe ledge 115 ft. It is well-defined, about two and a half ft wide, and samples assay from $30 to $40 per ton. There are 75 tons on the dump. The double-compartment shaft, started from tbe 200 level is intended to sink until the 300 is reached.

NORTH STANDARD.—The east crosscut from the combination shaft has cut a body of favorable ledge matter, consisting of quartz, clay and porphyry. The quartz is of a bright, lively character, and looks well. The crosscut will be continued until the Concord ledge is cut, when drifting on the ledge and stoping ore for milling purposes will he commenced.

SOUTH NOONDAY.—Crosscutting on the 150 level cast and west is being made. The east crosscut is in 25 ft. The ground in the face is favorable, with indication of cutting the Cummings ledge. The west crosscut is in 18 ft, in a soft formation, with here and there bunches of quartz and clay.

QUEEN BEE.—The north drift, 400 level, is in 143 ft. The ledge in the face is in ore of fair grade, containing no waste whatever. When the drift is in 150 ft the ledge will he crosscut east and west to the foot and hanging walls to determino the widtb of the ore body.

SOUTH BULWER.—The shaft has a depth of 533 ft with the bottom in good working ground.

HOMER.—Total length of tunnel, 136 ft. At a point 122 ft from the mouch of the tunnel the vein was intersected and found to be three and a half ft wide, all good milling ore, and showing coarse gold. It will mill from $30 to $40 per ton.

CON. PACIFIC.—The north drift on the 400 level has a total length of 153 ft. A vein three and a half ft wide bas been passed through, which prospects first olass. The south drift on the same level also has a total length of 153 ft. The station at the 500 level bas been completed and a crosscut started east.

SILVER HILL TUNNEL.—A contract has been let in the workings west from the Oro main shaft, and the work will be pushed to completion as fast as men aud money can do it.

BOOKER.—Bodie *News*, Mar. 5: The drifts north and south on the 400 level are being advanced rapidly. The second eight-inch plunger has been placed in position at the 250 level, and combined are sending out 23 inches of water. The 10-iuch plunger will be put in position next at tbe 500 level. An upraise will be started on the vein and connection made with the 400 level for the extraction of ore. Sinking the shaft will be commenced for the lower levels.

ORIGINAL SUMMIT.—Work in the drifts on the ledge at 100 level has been discontinued, and sinking the shaft will be continued to the 200 level, when a station will be opened and drifting commenced.

SONORA CON.—The crosscut at the 100 level is in 133 ft. The formation has changed to a light-colored porphyry, and the rock would indicate the near approach to a ledge.

DOUBLE STANDARD.—Work has been resumed in the west crosscut from the bottom of the winze. The crosscut is at a depth of 300 ft, and in very favorable formation.

MCCLINTON.—The west crosscut, 500 level, being run to cut the Sharon, Pacific and intervening ledges, bas been passing through seams and bunches of quartz, and has attained a total distance of 312 ft. The north drift, on the Eshington ledge, 675 level, has attained a distance of 100 ft. Three ft of the ledge next to the footwall is much better ore than was exposed in the mine at any other point.

NEVADA.

WASHINGTON NOTES.—*Foothill Tidings*, Mar. 6: At the Yuba gold quartz mine they are driving the lower tunnel and 60 ft in the new ore chute. The ledge is from two to seven ft wide and fine looking ore. They have about 150 tons of this ore, taken out while drifting, now on the mill dump. The Fall Creek (Lindsey) mine is looking well. They have opened a new chute of ore in one of the upper levels, which shows well in free gold and sulphurets, and the ledge in the old workings still holds its own in siz and quality. Foster & Grissell, below the Fall Creek and near the Yuba company's dam, have a fine prospect. They have a large ledge, and from it they had some rock worked which paid $33 per ton. The Ole Nelson mine, on Diamond creek, is idle, but Mr. Nelson informs us that as soon as spring opens he will start work again, as the last crushing of ore from the lower tunnel paid very well. Mundy & Freeman have a fine prospect on Grouse ridge. They sunk a shaft on what seems to be a decomposed quartz ledge, and as high as $60 to the pan was taken out while they were sinking. Mead & Cole have a good showing in a quartz ledge in Canyon creek. The Helgleson mine, on Canyon creek, is bonded to parties in San Francisco for a good price. The Mt. Zion gravel mine, on Poorman's creek is showing good prospects in the present workings.

LIVE YANKEE.—The outlook is very encouraging. The last crushing of 100 tons of rock yielded a large amount of gold. The owners were well pleased with the result. The new shaft that was being sunk on the south side is completed.

THOMAS.—The mill, which has but 10 stamps, cannot take all the rock that is broken. There is at present sufficient broken quartz stowed away in the drifts to keep a 20-stamp mill steadily employed for six months.

OLD WHEEL.—Some rich rock is being crushed at the Keith mill. It yields $20 per ton.

MORGAN.—Situated on Gold flat; is being slowly developed. The ledge is large, but of small grade. The ore is easy to extract.

EL CAPITAN.—*Transcript*, Mar. 3: Some fine specimens of gold-bearing ocher were found in the east crosscut of the north level, 75 ft from the incline. The two-ft ledge that was struck 32 ft from the incline has been followed 43 ft, and shows 20 inches in the head of the drift. Between the ledge and the footwall extends a two-inch streak of ocher, two pounds of which realized $3.50 in coarse gold. There are 45 tons of good looking ore on the dump, and preparations are being made to stope in the south drift. The air shaft to tap the south drift 130 ft from the incline is finished. It is three by four ft in the clear and timbered with two-inch plank.

JACOBS & SARGENT.—About 35 tons of gravel, taken out while sinkiog the new shaft, on being crushed yielded $600 worth of gold. Owing to an accident to the pump the raising of gravel has been delayed for a few days, but everything is now ready to push ahead once more.

PIONEER REDUCTION WORKS.—Fifty-six tons of sulphurets, reduced a few days since, yielded as follows: Gold, $80 per ton, or within less than 10% of 6re assay; silver, 428 ounces, or 85% of assay. The cost of extracting the latter was but $2 extra per ton. Another lot of two and one-half tons of sulphurets was worked and yielded 90% of assay.

PLACER.

CENTENNIAL.—*Herald*, Mar. 0: Is one mile from Michigan Bluff, and has a very favorable aspect at the present time. The owner bas negotiated for a mill, which will be in course of erection soon.

PARAGON.—For tbe month of February the drift yielded 504 ounces of gold, wbich net, clear of all expenses, $8,000. When it is considered that this is a regular thing, likely to last for many years, the value of the mine can be appreciated.

FRANKLIN.—Dutch Flat *Forum*, Mar. 4: The work consists of a prospecting tunoel, which follows the bedrock, which is a slight incline pitching towards tbe town for a distance of 550 ft, when it disappears, and at present no bedrock has been discovered, although the tunnel bas been pushed ahead some 50 ft further on an incline of nearly 45 degrees. A good track is laid and hoistiog works rigged for taking out tbe gravel which is dumped at the bead of Bear River tunnel; a pump is also connected with the works, which keeps tbe mine clear of water. Ere long we bope to chronicle the discovery of rich-paying gravel.

TUOLUMNE.

STONER & BARKLEY—*Independent*, Mar. 6: Said to be the west extension of Rice and joins tbe Shanghai on the north. Has some very encouragiog prospects which indicate that it may be classed among the valuable milling veins.

SHANGHAI.—Was discovered in '53, and has yielded many thousands of dollars. Application has been made for a patent. Recent operations have given good prospects; the vein has many feeders and gives promise of richness.

HENNESSY & KING.—Located in 1856 by an Austrian, who discovered three pockets along the vein, and just below the surface exposures that netted $10,000. To extract these pockets only required the labor of two men, with picks and shovels, about two weeks. The present company continue to work tbe vein with promising results.

NEVADA.

WASHOE DISTRICT.

OPHIA.—Gold Hill *News*, Mar. 10: In crosscut No. 2, 2100 level, the vein widens and improves in quality going north. The winze, 40 ft south of the main east drift, is down 55 ft. The north and the south drifts in the Hardy vein, 2200 level, are 138 and 140 ft respectively; both are in good-looking quartz. The drift north in the Hardy vein, on the 2300 level, is in 160 ft. The joint Mexican crosscut east on this level is in 137 ft.

BELCHER.—On the 2760 level the winze has 100 ft yet to go before encountering the ore vein found on the 2700 level. The south drift on the 3000 level is now 300 ft in length. On the 3000 level the face of the south drift is under the crosscut on the 2760 level, in which the ore was found, hut is from 75 to 100 ft west of whore that vein ought to lie on this level.

YELLOW JACKET.—A softer formation containiug more quartz has been encountered in the crosscut west, 2700 level; total length, 110 ft. The north winze is in porphyry; total deptb on the slope below the 2700 level, 250 ft.

OVERMAN.—Crosscut No. 2, 1900 level, has passed through a mixture of quartz and porphyry into a beautiful quartz formation which looks and promises well. The drift on the 1700 level has been put in working order and a raise started above the winze from tbe 1700 to the 1900 level.

SIERRA NEVADA.—The north drift on the 2400 level is encountering good vein material; total length, 385 ft. The north drift on the 2300 level is 535 ft north from the east shaft. East crosscut, 2300 level, is 100 ft, face in vein porphyry; winze below the 2400 level, 135 ft north of the incline, down 53 ft.

ALTA.—The north and south drifts are being extended along the ore vein, and are still encountering most promising indications; total lengths respectively, 495 and 400 ft. Lady Washington crosscut No. 1 west, 1550 level, is in 65 ft.

CALIFORNIA.—The crosscut west on the 850 level is in 63 ft. Crosscut west, 1500 level, is in a heavy vein material, carrying some quartz. The drift south from Opbir, on the 2300 level, has reached a length of 200 ft.

BEST & BELCHER.—The joint Con. Virginia crosscut east on the 2000 level bas attained a length of 100 ft, and is penetrating hard rock.

UNION CON.—The winze from the 2400 level has attained a depth of 25 ft in vein material carrying quartz. The shaft is 47 ft below the 2400 level. The main south drift on the 2400 level is still in a heavy vein formation carrying quartz; total length from the Union shaft, 310 ft.

SUTRO TUNNEL.—The north header is in 2,336 ft, carrying it 268 ft into Con. Virginia ground.

SAVAGE.—The drift from the 2400 level of the C. N. S. shaft for the incline is 473 ft in length, and is still encountering hard rock and a heavy flow of water.

SCORPION.—The crosscut west on the 500 level is still in a formation of highly-mineralized matter. The crosscut east is also in vein material.

ANDES.—The winze from the 350 level bas some very good-looking rock, as has the drift east on that level.

CALEDONIA.—Still pushing the drift south on the 1900 level and penetrating a formation of soft vein porpbyry; total length, 800 ft.

CROWN POINT.—The wioze is penetrating softer ground; total depth, 160 ft.

BELMONT DISTRICT.

BELMONT.—*Courier*, Feb. 28: Is opening up a fine body of ore in the 300-ft drift now running north. The vein at face of drift is four ft thick, with bunches of fine sulphuret ore all though it, and improves every foot of advauce. The concentrating mill has started up and can reduce all the low-grade ores into bullion at a profit.

SAN ANTONIO.—The 450 crosscut has a total length from foot of incline of 90 ft; it has passed through a bar of very hard slate, and is now running in a very good formation and will cut the vein in 15 or 20 ft further progress.

BRISTOL DISTRICT.

BRISTOL.—Pioche *Record*, Feb. 28: Has made a location comprising 000 acres, adjoining the eastern limits of the present townsbip. The boring apparatus will soon begin sinking for flowing water. Then operations will commence in the erection of the mill and furnace.

HILLSIDE.—The foundation of the old furnace has proven to be a bonanza; over $10,000 in bullion has already been taken out, melted into bars, and there is still in sight about $1,000. It is thought that some $24,000 in all will be taken out.

EUREKA DISTRICT.

UNION.—Eureka *Sentinel*, Mar. 2: On Prospect mountain; has out 25 tons of good ore, and the body seems to be gathering strength as it goes down.

EUREKA CON.—Second level—North drift in 15 ft. Third level—Northwest drift in 174 ft. Seventh level—Northeast drift in 177 ft; north drift in 60 ft; winze in 67 ft. Eighth level—Southeast drift in 182 ft. Ninth level—Upraise in 56 ft. Tenth level—East drift in 190 ft. Eleventh level—North drift in 100 ft.

CUSTOM ORE.—The Connolly has sbout 200 tons on tbe dump, tbe Home Ticket 100, and the California 75. The ore is now being dellvered from these several mines to the Richmond reduction works. The indications are that there will be a larger supply of custom ore from outside mines tbe coming season than at any previous period in the history of the district.

JACKASS RABBIT DISTRICT.

DAY.—Pioche *Record*, Feb. 28: The drift from open out, upper works, bas progressed 24 ft, the face being all vein matter, with spots of very rich carbonate ore. The east incline shaft is down 94 ft from tunoel level. Drift west for the cave ore body bas commenced. All efforts are concentrated in the open cut drift and east incline. In tbe incline the crystal line fissure makes a splendid sbowing.

JETT DISTRICT.

JETT CON.—In tbe Centennial ledge the quartz has thickened up to five ft from foot to hanging walls.

CENTENNIAL.—The shaft is down 70 ft, with rich sulphuret ore in the bottom.

CALIFORNIA.—The big strike of good ore bas created quite a stir hereabouts, and many who own good prospects here are coming in to work their claims.

LIDA VALLEY DISTRICT.

MINING ITEMS.—Esmeralda *Herald*, Mar. 6: In the last few weeks several valuable strikes have been made in some of the mines that are being prospected to a greater depth than ever bcfore. Most notably is the strike in the Fortunatus mine. In crosscutting at a depth of 180 ft a large body of excellent free-milling ore was struck, assays from which sbow from $60 to $95 in gold, and from $30 to $45 in silver per ton. This lead is one of which the size of it is not known at any depth. Good milling ore of a low grade is found for 3,000 ft in length, and for a width of from 200 to 300 ft. Recent developments on El Capitan, the first east extension of the Fortunatus, bas opened up a body of free-milling gold ore two ft wide, which assays several hundred dollars per ton. From other mines in the district ore is being extracted, principally from the Martin & Henley, Centennial and Brown & Henry. Brown's Hope, Death Valley, Cinderilla and Lida Hill are all making tbe boys happy. The Suwanee is clearing out aod timbering the main tunnel, preparatory to driving it ahead and striking the lead at a depth of 150 ft from the surface.

WINNEMUCCA DISTRICT.

ITEMS.—*Silver State*, Mar. 6: In a recently located claim in Winnemucca mountain, west of town, the croppings of tbe ledge are over 20 ft wide, and the ore is different from any bcretofore found in the mountain. A sample of the ore assayed $1,880.50 to the ton, of which $262.-74 was silver and $1,023.76 gold. The owners of the Leonora are sinking an incline on the ledge and find some high-grade ore. The Big Nick miners have struck wbat appears to be a large deposit of low-grade ore. The owners of the Silver Wedge, while working assessments, found some very good ore in the ledge.

PARADISE.—Never looked better than it does at present. There are between 400 and 500 tons of ore at the mill, and a small force of miners keep up the supply on the dumps at the mine. The ore works from $00 to $80 per ton, and the mill produces from $25,000 to $30,000 a month in bullion.

BULLION.—The ledge is from 8 to 20 ft wide, and the ore works from $30 to $80 per ton.

MOUNT ROSE.—Some of the ore was recently worked in San Francisco, and went up in the hundreds per ton. A few tons of a different character of ore is now being reduced at the Paradise company's mill.

ARIZONA.

HEAD CENTER.—Tucson *Star*, Mar. 4: The north or old shaft is down 240 ft, with good ore at the bottom and a 50-ft drift on the ledge. There are 50 tons of ore on the dump at this shaft valued at $7,000. The new shaft is down 180 ft. The ore on the dump of this latter shaft is rich. There are 00 tons that will yield $200 per ton. Three hucketsful containing a mass of beautiful born silver literally bespangled with gold was brougbt up from the bottom of the shaft. The vein from which the ore was taken is strong and well defined. Sample assays from the workings of the shaft and drift gave an average of over $250 per ton, all of the ore carrying a large percentage of gold.

SUNSET.—The main shaft is down 60 ft, all the ore heavily impregnated with chlorides. The same character of ore is found in shaft No. 2; at a depth of 50 ft the ledge bas widened to seven ft, and as depth is attained, appears to be still widening. The body of the ore in sight is very large aud of a high grade. There are 200 tons of ore on the two dumps.

MONITOR.—About 600 ft of the ledge has been ascertained by sinking and stripping. The croppings in many places are very bold and rich. At every point where the ledge has been cut or sunk upon a vein of from three to six ft wide has been found, all mineral and high-grade, ranging from $35 to $250 per ton in silver, with a good showing in gold. The deepest shaft is 20 ft, and shows a well-defined vein from top to bottom of about three ft wide.

BELMONT.—There are three drifts running from the main shaft into the vein, all in solid ore. The 40 and 70-ft drifts have not crossed the vein, although in some 20 ft. The 100 level is in 35 ft, and has not yet struck the hanging wall. In the lowest level a shaft is being sunk which is in a solid mass of ore. The claim is 3,000 ft long and 000 ft wide. On the southerly end there are also some extensive developments made, which show the same character of ore in quality and quantity.

SAFFORD ITEMS.—The Delaware mine, one of the late discoveries in the Graham mountains, at a depth of 10 ft gave assays in gold and silver of $3,000. The Copper King has a shaft to a depth of 70 ft, and gives assays of 50% in copper. This mine is situated in the Rio Bonita mountains.

ARIVICA ITEMS.—Gilola has a large body of Longarina ore on the dump. At Ore Blanco, Smith & Hariszly are down to the 100-ft line on the California and crosscutting the ledge. S. S. Arnold is sinking a 100-ft shaft on the Bridgeport mine, showing a body of rich ore.

CONTINUED ON PAGE 172.

A Mexican Mining Town.

Mr. A. D. Temple, formerly of San Francisco, bnt now at the Candelaria mine, San Dimas, Durango, writes the following interesting letter to the New York *Sunday Courier:*

To the mining man acquainted with the sage-brush covered sand deserts, and bleak, snow-capped psaks characteristic of the silver-producing regions of Nevada and Utah, the verdure-covered mountains and shady *quetradas* of San Dimas are a most agreeable change.

Along the banks of ths rushing, noisy stream tbat gives motive power to the *haciendas* in which the rich ores of the district are worked, are numerous orange and banana plantetions, where the light green of the broad-leaved banana plants and the desp green of ths orange show in enticing contrast to the ripe golden fruit. Nestling in the shade of their teller companions may be ssen the brigbt scarlet blossoms of the pomegranate and the ripe fruit as well, looking almost like waxen imitations. White limes and guaves abound on every side in such profusion as to almost destroy their market value. Here and there are to bs seen trees bearing ths alligator pear, with a pulp reminding one in taste and appearance of beef merrow. Farther up, just below the extreme lower limit of frost, the far-famed chsiromoya attains its greatest perfection.

Up the mountein side above the stream are scattered at short intervals numbers of small corn fields usually cultivated by some indspendent proprietor who, secure in having abundant rains to bring his crops to maturity, lies lazily under the grass-thatched roof, smokes his corn-ehuck cigarette, chews a huge piece of the roested stalk of the maguey, or dozes away the day supremsly and sersnely indifferent to the latest quotations of Mexican bonds, the next candidate for President, or the highest ruling rates for Mexican dollars in San Francisco, while his wife grinds corn of last year's crop into *tortillas* (the Mexican steff of life), and the brown-skinned babies, naked and unheeded, play and tumble about with the dogs on the floor.

Flocks of green perrots wheel and circle overheed with ceeseless chattering, while occasionally a squad of harsh-voicsd macaws, gorgeous in red heads, yellow bills, blue wings and green teils add their discordancy to ths general din. A speciss of black phsasant apparently, kuown as "chichalaka," calls to its mate from the heavy shede of a wild fig tree with a voice forcibly reminding ons of the grating of an ungreesed windless. The black vultures flap lazily around seerching for cerrion, and whsn found, light on the trees around with the business-like gravity of undertaksrs and the judicial solemnity of a coroner's jury.

A "kelela," that curious link between the eagles and vultures, first described, I believe, by Audobon, is perched in a tree by the sids of the trail, waiting Micawber-like for something to turn up. His yellow beak and white head causes him at first sight to bs mistaken for our repressntative bird. Frightened by the clattsr of horses' hoofs, a doe with her two fawns darts from ths edge of the cresk across the narrow trail and disappears in the heavy brush on ths other sids.

Wild life is abundant, and it is witb surpriss that rounding a sharp turn we see San Dimas but a few hundred yerds ahead. Built on a steep declivity with its lower buildings abutting on the creek, and its upper ones extending up towards the top of the spur of the Sierra Madre that towers 4,000 feet above, San Dimas has the appearancs of having slid from some more lofty altitude to its present position, and being only prevented from going lower by the abrupt cliffs that bound the west side of the creek, on the summits of which the wild goats and deer show themselves fseding undisturbed, and apparently within easy rifle shot.

A mule train is slowly passing through tbs main strest as we ride up, loaded with silver ore for some of the several haciendas, that we can see below us; on ahead rides a dark-skinned *muchacho* astride of the old bell mare, and behind straggle along the pack animals, stopping as occasion offers to pick up a banana peeling or an old straw hat that they munch with ths keenest appreciation as they again start along, oblivious to the objurgations of the arrieras, whose epithets if translated would excsl in searching and earnest eloqueuce the most impassioned accents of a fishwoman.

Each mule is carrying at least a *carga* (300 lbs. Spanish), and to every five mules there is an arriero to attend them, and refasten the sacks in case they get loose from the network of rawhide ropes that fastens them to the pack eaddle.

On either eide of tbe cobble paved street we have a view of the mixed assortment that forms the stock of a Mexican storekeeper. A sack of dried red pepper and a bale of sun-dried beef lie on the floor under a roll of French calicoes, and some unbleached eheetinge that are manufactured in this country. Cans of Blue Point oysters and Columbia river salmon jostle against Bordeaux sardines and English sweet biscuits. Spanish wines, French brandies and cordials, English "Old Tom," gin and Mexican "mescal" (a fiery but pure liquor distilled from the juice of the century plant), and Amerioan bitters etand side by side on the shelves.

The dry goods are all of European make save tbe coarsest cotton goods. With the exception of black, which is the chief favorite, the colors are of the brightest, red being very popular. American fabrios are conspicuous by their absence, whioh ie certainly etrange taking into consideration the geographical position of the two countries, and the reputed enterprise of ths Yankee manufacturer.

American firearms, however, and ammnnition are fully appreciated to ths almost total exclusion of all other mekes. Winchester repeatsrs and Colt's six sbootsrs are more familiar to the Mexicen ranchero or miner than to ths averags New Yorker.

The stores are variety stores in the most liberal sense of ths word, and it is impossible in a short article to give more than the msrest hint of the various wares that make up their assortment.

At the lower end of the strest is the plaza, the only piecs of level ground in the town, and containing perhaps one-sixth of an acre. Around it are built ths court-house, jail and church. I write them in their order of merit, for the Mexicen priests are, as a rule, to put it mildly, "a hard lot."

Back of the plaze on the mountain side beneath a dilepidated shed, is a crude attempt at a refining furnacs known as a *vaso*. In appearance it is half way between a blacksmith's forge and an old-feshioned bake oven, such as thsy have in "Ole Virginny." Here the concentreted tailings ere brought from the verious haciendas and the gold aud silver extracted by a process which, though thorough, is rather expensive.

A crowd of Mexicans are usually gathered around it, watching the operetion which is carried on by two men, one in lieu of an engine acting as motive power of the bellows, and the other being expert and general manager of the business.

The airy costume of the loungers, if introduced in Nsw York during the dog days, would undoubtedly become popular could some members of the Knickerbocker club bs induced to set the feshion. Its intrinsic merits are cheapness, coolness and simplicity. The items are leather saudals, wide cotton drawers cut "sailor fashion," supported at the waist by a red or scerlet sash, calico shirt with very abbreviated tails worn outside of ths drawers, allowing a fres passage of air, a hroad-brimmed palm leaf hat; and a breech clout called a "cotensie" completes the outfit. Total value, about $3.50.

Up the *cordon* behind the *vaso* winds a serpentine trail fit only to be traveled by mountain-bred animals. Far ebove us a cloud of dust shows that another pack-trein is coming, probably loaded like ths first with silver ore, as most of the mines, with ths prominent exceptions of the Soledad and Candelaria, ere situated on the other side of the mountain.

The sun is bsating down vigorously, and we will take sheltsr bsneath the cool portal of our friend Don Antonio, smoke cigars equal to the best Havanas, drink cool lemonads and, whils our horses are resting and feeding, make our plans for starting to visit ths celebrated mines of Tecolole and Promontorio, that are now lying idle, in the early morning bsfore the sun shines on yonder high peak to the westward. Till then, *adios.*

A Mine Owner's Mistake.—A men, now a prominent merchant of Virginia City, won at poker an undeveloped gravel claim near Nevada City, worth in the neighborhood of $200. His friends had the laugh on him for several days regarding his "investment," and asked him what proportion of the taxes he would pay in case they accepted the property as a gift. He finelly got mad at their incessant guying, and told them they would see he was not such a fool as they took him for before he got through with that mine. He then wrote to some capitalist acquaintauces that he had a claim worth a fabulous sum, which he would sell for $2,000, being hard pressed financially. The bank was next visited, $500 worth of gold dust and nuggets bought, and the claim thoroughly "salted." When the intending purchasers arrived they prospected the ground a little, and the panning out was attended by big clean-ups. They paid the $2,000 tbe same day, and got possession of the ground. Work was at once begun, and thsy took out $8,000 insids of three weeks. The "salter" was so taken aback that he did not smile for a month, and the parties to whom hs confided his shrewdness at the time of its perpetration, never meet him to this day but they ask him if he has another gravel mine to sell.—*Nevada Transcript.*

Hot Water on the Comstock.—Ths Savage new water is quits milky, which shows that it comes from a place where there is clay or decomposed quartz. Before the water burst in they had cut through several small veins of quartz and eome water had been encountered. While superseding a small punp by a large one the flood came. It is not ecalding hot and has been encountered 125 feet on the slope above the 2400 level, 240 feet below the 2200 level. A strong flow of hot water was tapped iu the west drift on the 2400 level of the Chollar. The hottest water yet encountered on the Comstock is in the Belcher on the 3000 level where the diamond drill was sent east to guard against an influx. It is with difficulty that its exact temperature can be taken, as the hole is horizontal. By holding the bulb of the thermometer under the drippinge from the hole the mercury rises to 162°. Could the exact temperature of the water be obtained hy fastening a bulh in the hole it would doubtless add a few degrees to the above. Here on the mountain water boils at 198°.—*Gold Hill News.*

The certificate of reduction of the capital stock of the Comet mining company, from 150 shares at $100 per share to 150 shares at $5, was filed last week.

A New Method of Desulphurizing Auriferous Pyrites.

There is no portion of the various processes for workiug gold ores which has more occupied the attention of charlatans, as well es that of skilled metallurgists, than the matter of rendering auriferous pyrites accessibls to the ordinary method of amalgamation. Amalgamation, yielding, as it does, quick returns at low cost, becomes valueless when applied to the treatment of sulphurets. Hence it is that in many mines when the undecomposed ores below the natural drainage level are reeched, only a small pert of the precious mstal can be extracted with mercury by the ordinary mill process. In such cases the sulphurets must first be concentrated from the tailings, and subjected to soms chemical or other process for the slimination of the sulphur, which is the binding substancs or force which rstains the gold so firmly in its mineral embrace, that amalgamation, however carefully employed, is powerless to take it away. Ths process most usually employed is calcining and chlorinizing—a process whicb requires a large and expensive plant and skilled workmen. This process is so costly that it is only applicable to very rich mines, or to bs worked as a specialty, by buying ths concentrated sulphurets of numerous mines of moderate value. Hence the question of cheap desulphuriziug is a very important one. At the late meeting of ths American Institute of Mining Engineers, the following paper was read, in relation to this matter:

We have had occasion recently to examine a process which embodies features that are likely to ensure ultimets success in securing a cheap mode of desulphurizing auriferous sulphurets. Prominent emong its advantages ars great simplicity, and, therefore, low first cost.

An Experimental Plant

Is now in operatiou et the works of the Manhattan Refining Company, Jersey City, of which Mr. Walker, the inventor of the new process, is the president. The principls upon which it is hased is the following: The crushed ore is blown through a long series of pipes at a red-heat, by means of a mixture of air and steem. During its pessage through these pipes, the sulphur of the ore is oxidized, passing off as sulphurous acid, while the fiue desulphurized ors is allowed to ssttls in a dust chamber. Ths gases, which are still charged with some fiue dust, are passed through a watsr trap, which washes them, so that euy possibility of mschanical loss, by suspension of fins particles in the gases, is precluded.

Ths plant consists of a charging bopper from which the ore is carried by a feeding screw into a receptacls, where it meets with ths mixture of air and steam. The steam, before coming in contect with ths ore, passes into an injector, which is also connected with the air pipe. The air is now supplied by a small compressor, whicb is usually run up to 10 pounds, its pressure being, thsrsfore, approximately equal to that of the steam ussd. Ths current of air and steam carry the fine ors into the 2½-inch wrought-iron pipe, which is heated in a special furnace. The length of pipe exposed is about 360 fest, made up iu sections, ths joints being in the middls of the longer straight section, while an eesy aud gradual hend makes up the shorter side of the rectengle, the shaps in which the pipe is placed in ths furnecs.

An Apparent Objection Removed.

Mr. Walker's experiencs has been that the inner surface of the pips is rapidly coated with an adhesive crust of magnetic oxide—a fact which will not appear astonishing to those who have followed the progress of the Barff method of protecting iron against rust, as the very conditions described by Prof. Barff as necessary in the production of a magnetic film, are complied with in this case. Ths formation of such a lining within the tubes is, of course, a very favorable circumstancs, as it will act as a rsliable protection against any corrosion of the interior of the pips, ths duration of which will, therefors, depend solely upon the rats at which it is burnt by the gases of the fuel. The choics of the latter will, therefore, be of soms importance, and naturally wood, if it can bs readily obtained, will be most suitable.

The Rate of Feeding the Ore

Will naturally depend, to some extant, upon its nature; material higher in sulphur demanding a larger volume of air, and admitting only of a slower feed. We are informed that the capacity of the furnace now built is about three tons per pay. It is thought that much more can be obtained, and that it will be cheaper to run poor ore and tailings though the furnace in bnlk than to dress it hy mechanical means, and work the rich concentrates obtained. Among the material experimented with is some Haile mine ore, running, according to an assay made by Messrs. Carsten, 1.4 ounces of gold, worth $28.-94. The calcined ore was found by the same chemists to hold 1.50 ounces of gold, worth $31.60 per ton. By amalgamation test, 1.20 ounces, or $24.80, were extracted, eo that about 80% of the gold contained in the sulphurets was rendered accessible, not counting the amount prohably lost during the process of amalgamation.

We may add that the calcined pyrites were found to hold only 5.03% of sulphur. As far as the process has been developed the results obtained are highly encouraging. The simplicity of the plant, the absence of all expensive or ponderous machinery, and the wide range of capacity which it possesses, will commend it to those who are struggling with rebellious ores.

Native California Fishes.

Ths lsst report of tbe Fisb Commissioners is followed by one upon the native fishes brought to the San Francisco markets, written by W. N. Lockington, who watched the markets for the purpose.

As the fishermen do not distinguish many of the marine species from sach otber, salling several distinct species, sometimes belonging to different families, under such nemes as smelt, rock fish, sole, etc., and es no record of number or weight is kept, all estimates of the actual quantity of any fish sold in the markets must bs ths merest guess, and all that can be done is to form an approximate opinion of their comparative abundance or scarcity.

More then 90 species are brought to market in greatsr or less numbers, but the groups of fishes which are most important and prominent ere the *Salmonidæ*, including the salmon, trout, and true smelts, ths *Embiotocidæ*, or viviperous perch, a family confined to this coast (one spscies excepted), the *Pleuronectidæ* or flat fishes, 13 spscies; and the rock-fish or rock-cod, under which title are included soms 14 or mors species belonging to the femilies Scorpænidæ and Chiridæ.

Nsxt to these come the sturgeon; the *Clupeidæ* or herriug family, which furnishes thres abundant species; the cod-fish tribe *(Gadidæ)*, which givss us only only ons common species, the tom-cod *(Microgadus californicus)*; the *Atherinidæ*, or mullet smelts, and the *Sciænidæ*.

Several species of *Scombridæ* (mackerels and their relations) occur along the coest of California, and are occasionally brought to market, especially iu the autumn, but nsvsr in abundance. Of this tribe the Pompino *(Poronotus simillimus)* is the most regularly procurable, and is highly prized for its delicacy.

The only fresh watsr fishes brought to market are the Secramento river psrch, large quantities of which are consumsd in the interior of the State; four species of *Cyprinidæ*, the most important of which are the miscalled pike (*Gila grandis*) and the *Orthodon;* and the sucker (*Catostomus occidentalis.*)

To thess groups, with the excsption of a single species of skate, belong almost all the native fishes habitually eaten by the white residcuts of ths city, sincs the various species of Blennidæ, popularly celled eels, end the large marbled sculpin *(Scorpænichthys marmoratus)* ers of very occasional occurrence, as is also the Barracuda (*Sphyræna argentea*). Verious spscies of *Cottidæ* or sculpins, of rays and sherks, stc., are, however, eaten by the Chiness. The rock-fish or rock-cod, sometimes evcn called cod, have no relationship whatever to the true cod-fish, but furnish our markets with a vsry large proportion of the supply, as most of thsm occur throughout every month of the year. The two species of *Sciænidæ*, which are tolerably abundant, are the kiug-fish and the sea-bess, both delicious fisb; but much of the food sold as sea-bass at the resteurants is sturgeon.

Among ths flet-fishes one is known by the dealsrs as Turbot, another as Bastard Turbot, a third as Monterey Halibut, a fourth as Flounder, end a fifth is the true Halibut (*Hippoglossus*), which is occasionally brought down in ice from Pugst sound, and is now and then teken at the Farallones; leaving eight quite distinct species to be sold under the common name of "sole," although not one of them is a true sole.

Two species of the *Atherinidæ* are commonly sold as smelts, and the *Salmonidæ* furnish three species of true smelts, which are by soms dealers distinguished as "Silver Smelts."

The herring *(Clupea mirabilis)* is abundant during the winter and spring months; the sardine (*Clupea sagax*) is present in smaller quantities during most of the year; and the Anchovy (*Engraulis ringens*) is abundant in tho bay.

No Premium on Old Coins.—The Treasury Department is very often in receipt of letters asking whethsr there is any truth in the frsquently published statement that the Government has offered a large prsmium for the U. S. silver half dollars coiued in the year 1823, and also asking whether minor coins of ths same year and prior years are purchased by the department at a premium. For the information of all concerned the Secretary announces that ths Government pays no premium on any of its coins, and redeems them under certain regulations at their face value only, regardless of tho year of coinage.

We notice the following in eome of our Eastern exchanges: Strange as it may seem, it is undoubtedly true, that the iron and copper mines of Lake Superior each turned out more solid gold and eilver during the year 1879 than the celebrated Leadville district. And yet they haven't made a hundredth part of the noise about it, nor has there heen hardly a hundredth part of the capital expended in doing it.

Canadian Petroleum Legislation.—Advices from Ottawa under date of Feb. 19th, state that Mr. Colby's bill to amend the Petroleum act proposes to remove the present discrimination against American coal oil by making the test more uniform. The test for Canadian oil will probably be increased, and that of American redneed.

Petroleum Wells in Germany. — The *Frankfurter Zeitung* says that a company with a capital of $250,000, has been formed at Bremen to work the recently discovered petroleum springs in Hanover, and that a similar company is forming in Berlin.

The Engineer.

Engineers—Their Value.

Under this heading the Boston *Journal of Commerce* comments on the engineer who solves problems—not the man, adds the editor, who opens the throttle-valve of a locomotive that goes racing over the track from one city to another, or of him who sets in motion one of the Corliss monsters that drives its thousands of spindles and looms or other machinery—but the civil engineer, who lays out the work that employs the others, deals either in one or the other of two separate and distinct realms—absolute fact or supposition. In the first he is often made to doubt his own sagacity and capability, for he must often change his course of action by reason of deductions drawn from experiment in which all his ideas of strength, elasticity or economy, have strangely departed. If he deals in the second he becomes, as too many have done, egotistical, and by very lack of knowledge or through force of circumstances, is constantly taking up untenable positions, making expensive, unsatisfactory and unsuccessful experiments—in other words, father of failures. Too much of this has been and is done. In many cases the parties are sooner or later involved in an outlay of thousands of dollars, and then comes the legitimate outgrowth of an attempt at the impossible—disagreement, disappointment, lawsuits, bitter feeling, loss of time, money, production, loss to every one involved; and yet it is a matter of every-day occurrence, and one which would have been avoided by the employment of a competent engineer for a day or two at the cost of $50 or $100. Men who know nothing of proportion, strength, elasticity, pressure, torsion, volume or density, get out an idea and patent it, or advise it and get it introduced, and then users get the effect by adoption.

Engineers are not always consistent, we had almost said not honest. They deal sometimes in vagaries or in elements of uncertainty without careful consideration or consultation of authorities who have preceded them, and give opinions or make out tables or results from preconceived ideas of matters to which they never give an hour's consideration in an honest, careful way. In this way they have in a measure detracted from their usefulness and the respect due them. Such a one, however, is always found out sooner or later, and finds his level. A man to do his work in a successful way should be careful in all his statements, and if he does not know a thing for a *sure thing*, say so, and not assume one thing or the other, for it is in engineering as with law—common sense is a pretty sure guide, and will lead you right a thousand times where it leads you wrong once.

In dealing with earth, iron, water, steel, steam, or any of the natural elements or created forces, we must remember that we are only capable, at least, of an approximation; that we must reason and investigate—and if we live to the extreme allotment of life, we are still learners. The profession has in the last decade done much to attract the attention and merit the admiration of men who never think deeply, clearly, or upon forces or matter other than to see results that are the outcome of close reasoning. There is too much of the superficial, too little of the real; to progress we must look closely at all elements, simple or compound; and when we have learned our own insignificance, we have commenced building upon a "bedrock" that does not "heave or settle."

The American Society of Mechanical Engineers.

By invitation of Prof. R. H. Thurston, of Stevens Institute, Prof. John E. Sweet, formerly of Cornell; Prof. William P. Trowbridge, of the engineering department of Columbia College, and other well-known members of the engineering profession, a meeting was held in New York, February 16th, to take steps to form a national society of mechanical or dynamical engineers. There are in this country associations of civil and mining engineers, but the mechanical engineers have had no society, though in England the same branch of the general profession of engineering has an association with 2,000 members, and as a consequence, this branch of the engineering profession has lacked the mutual aid and professional coherence which has characterized the departments of civil and mining engineering, whose powerful associations have proved so beneficial to the members of them.

The meeting was called to order by Prof. John E. Sweet, formerly of Cornell University, and Messrs. A. L. Holley and Samuel S. Weber were chosen chairman and secretary.

The object of the society, as set forth in the original draft of the by-laws and rules for the government of the association, is to enable mechanical engineers to meet and compare notes, and to facilitate the interchange of ideas respecting improvements in the various branches of mechanical science by the publication of papers, etc. The members are to be divided into four classes—regular members, associates, honorary members and junior members. The initiation fees are fixed at $15 and $10, and the annual dues $10. Payment of $150 will entitle eligible candidates to life membership. Seven years' practice as mechanical engineer is a condition of membership, provision being made in junior membership for such as have served for a shorter period.

Addresses were delivered by several well-known gentlemen, including H. R. Worthington, Charles E. Emery, etc. The *Machinist* says: "This movement has been almost spontaneous in its origin, having grown out of a widely extended and increasing desire for a generally recognized society, composed of active and progressive members, to take the lead in dealing with important problems in mechanical engineering."

Useful Information.

Rules for the Management of Steam Boilers.

We are indebted to the Hartford Steam Boiler Inspection and Insurance Company for the following rules, which they expose near the boiler of which they have charge:

1. Condition of the Water.—The first duty of an engineer, when he enters his boiler-room in the morning, is to ascertain how many gauges of water there are in his boilers. Never unbank or replenish the fires until this is done. Accidents have occurred, and many boilers have been entirely ruined from neglect of this precaution.

2. Low Water.—In case of low water, immediately cover the fire with ashes, or, if no ashes are at hand, use fresh coal. Do not turn on the feed under any circumstances, nor tamper with or open the safety valve. Let the steam outlets remain as they are.

3. In Case of Foaming.—Close the throttle, and keep closed long enough to show true level of water. If that level is sufficiently high, feeding and blowing will usually suffice to correct the evil. In case of violent foaming, caused by dirty water, or change from salt to fresh, or *vice versa*, in addition to the action above stated, check draft and cover fires with fresh coal.

4. Leaks.—When leaks are discovered they should be repaired as soon as possible.

5. Blowing Off.—Blow down, under a pressure not exceeding 20 pounds, at least once in two weeks—every Saturday night would be better. In case the feed becomes muddy, blow out six or eight inches every day. Where surface blow-cocks are used, they should be often opened for a few moments at a time.

6. Filling up the Boiler.—After blowing down, allow the boiler to become cool before filling up again. Cold water pumped into hot boilers is very injurious from sudden contraction.

7. Exterior of Boiler.—Care should be taken that no water comes in contact with the exterior of the boiler, either from leaky joints or other causes.

8. Removing Deposit and Sediment. — In tubular boilers the hand-holes should be often opened, and all collections removed from over the fire. Also, when boilers are fed in front and blown off through the same pipe, the collection of mud or sediment in the rear end should be often removed.

9. Safety Valves.—Raise the safety valves cautiously and frequently, as they are liable to become fast in their seats, and useless for the purpose intended.

10. Safety Valve and Pressure Gauge.—Should the gauge at any time indicate the limit of pressure allowed by this company, see that the safety valves are blowing off. In case of difference, notify the company's inspector.

11. Gauge Cocks and Glass Gauges.—Keep gauge cocks clear, and in constant use. Glass gauges should not be relied on altogether.

12. Blisters.—When a blister appears, there must be no delay in having it carefully examined and trimmed, or patched, as the case may require.

13. Clean Sheets.—Particular care should be taken to keep sheets and parts of boilers exposed to the fire perfectly clean, also all tubes, flues and connections well swept. This is particularly necessary where wood or soft coal is used as fuel.

14. General Care of Boilers and Connections.—Under all circumstances keep the gauges, cocks, etc., clean and in good order, and things generally in and about the engine and boiler-room in a neat condition.

Manilla Rope Tests.—One of the most important, and perhaps most critical, operations which have to be performed in connection with torpedo service is lowering the torpedo boats from the deck of a ship ready for being sent on their deadly mission. When it is considered that some of these mischievous little crafts weigh from 8 to 10 tons, it will be seen that the ropes used in thus manipulating them are required to be of the highest quality and most trustworthy make. To this end the authorities at Portsmouth dockyard have recently cast about for a really reliable rope for the torpedo ship *Hecla*. The rope selected is best 3-strand white manilla, of two sizes, namely, 5½ inches and 6 inches circumference, respectively. The 5½-inch rope was guaranteed by the makers to lift 12 tons, and the 9-inch 14 tons. Samples of these ropes were recently tested at Portsmouth, under the superintendence of Staff-Captain Kiddle, the Master Attendant, with excellent results. The lengths tested were each 12 feet, between the gripping points, and the 5½-inch rope did not break until a tensile strain of 12½ tons was reached; whilst the 6-inch rope held out up to 16½ tons, thus giving an ample margin over the guaranteed strength. As a means of comparison, it may be interesting to mention that a 6-inch Italian fiber rope would not stand a strain of more than 13½ tons, whilst Russian hemp rope of the same size cannot be reckoned on for more than 11½ tons.

Glue for ready use may be prepared by adding to a given quantity of best glue, enough common whisky to make it of the proper consistency. Put both together in a bottle, cork it tight, and set it away for three or four days, when it will be fit for use without the application of heat. Glue thus prepared will keep for years, and it is at all times fit for use except in very cold weather, when it should be set in warm water before using. To obviate the difficulty of the stopper getting tight by the glue drying in the mouth of the vessel, use a tin vessel with the cover fitting the outside, to prevent the escape of the spirit by evaporation. A strong solution of isinglass made in the same manner is an excellent cement for leather. The hotter the glue when used, the better it will keep the two parts glued together, hence in all large and long joints the glue should be applied immediately after boiling. Glue loses much of its strength by frequent remelting.

A New Process for Refining Spelter.—We have lately been shown a sample of spelter showing unusual sharpness of crystallization and brilliancy of fracture, which is said to be as nearly chemically pure as the metal can be made. It was made from common spelter, under a process patented by Mr. A. Harnikel, 83 Maiden Lane, New York. We also have a piece of sheet zinc rolled from it cold, which exhibits great ductility and unusual toughness. We are informed that the specific gravity of the new spelter is 7.2, and that its resistance to dilute sulphuric acid is many times greater than that of any grade of this metal hitherto experimented with. For fine brass, cartridges, German silver and artistic castings, we should presume it would have unusual utility. The price ranges from 8½ to 9 cents.—*Iron Age.*

Good Health.

Cold Feet in Bed.

While winter is at hand, and with it the many attendant discomforts and annoyances of a chilly, frosty atmosphere, it is becoming to fortify ourselves against the influences and effects of cold. It is better to be so clothed as to feel a little too warm, rather than not warm enough. One of the common obstacles to personal comfort is cold feet, particularly cold feet at night. When abed one feels that he ought to be comfortable. We may succeed, perhaps, during the day in maintaining a passable degree of caloric in our extremities, but at night we may groan in sleepless torture until the small hours with icy feet. A contributor to the *British Medical Journal* gives a few simple suggestions on this seasonable topic, which we copy here for the benefit of our cold-footed readers:

The association between cold feet and sleeplessness is much closer than is commonly imagined. Persons with cold feet rarely sleep well, especially women. Yet, the number of persons so troubled is very considerable. We now know that, if the blood-supply of the brain be kept up, sleep is impossible. An old theologian, when weary and sleepy with much writing, found that he could keep his brain active by immersing his feet in cold water; the cold drove the blood from the feet to the head. Now, what this old gentleman accomplished by design, is secured for many persons much against their will. Cold feet are the bane of many women. Light boots keep up a bloodless condition of the feet in the day, and in many women there is no subsequent dilatation of the blood-vessels when the boots are taken off. These women come in from a walk, and put their feet to the fire to warm—the most effective plan of cultivating chilblains. At night, they put their feet to the fire, and have a hot bottle in bed. But it is all of no use; their feet still remain cold. How to get their feet warm is the great question of life with them—in cold weather. The effective plan is not very attractive at first sight to many minds. It consists in first driving the blood-vessels into firm contraction, after which secondary dilatation follows. See the snowballer's hands! The first contact with the snow makes the hand terribly cold; for the small arteries are driven thereby into firm contraction, and the nerve-endings of the finger tips feel the low temperature very keenly. But, as the snowballer perseveres, his hands commence to glow; the blood-vessels have become secondarily dilated, and the rush of warm arterial blood is felt agreeably by the peripheral nerve-endings. This is the plan to adopt with cold feet. They should be dipped in cold water for a brief period; often just to immerse them and no more, is sufficient; and then they should be rubbed with a pair of hair flesh-gloves, or a rough Turkish towel till they glow, immediately before getting into bed. After this a hot-water bottle will be successful enough in maintaining the temperature of the feet, though without this preliminary it is impotent to do so. Disagreeable as the plan at first sight may appear, it is efficient; and those who have once fairly tried it continue it, and find that they have put an end to their bad nights and cold feet. Pills, potions, lozenges, "night-caps," all narcotics, fail to enable the sufferer to woo sleep successfully; get rid of the cold feet, and then sleep will come of itself.—*Phrenological Journal.*

Milk Beer.

This new article of diet, said to be largely used in France for medicinal purposes, has lately been patented in this country by Edward Kokosinski, of Paris.

"The object of my invention," he says in his patent, "is to manufacture a beer which will possess special nutritive and hygienic qualities; and this object I attain by using whey in place of the water usually used in the manufacture of ordinary beer, as more fully described hereinafter.

"To make my improved beer, or milk beer, I use the following proportion of ingredients, namely, 33 kilogrammes of malt, 150 liters of whey, and 60 grammes of hops, preferably Bohemian hops.

"The whey should be freshly prepared, and be free from lactic fermentation and lactic acid.

"In brewing, a thick wort is used, and the fermentation is conducted at a low temperature, the steps of the brewing process being otherwise the same as in brewing ordinary beer. A brewing of the above quantities of materials will produce about a hectoliter of my improved beer.

"The use of whey in place of the water in ordinary beer results in imparting to the beer a greater quantity of albuminous matter and salts, which the milk contains, and which are identical with the salts of the blood, and thus renders the beer very nutritious.

"If desired, medicines such as quinine, tar, iron, etc., may be incorporated in the milk beer during its manufacture."

Comparative Mortality of Rich and Poor.—The most accurate statistics ever compiled on this subject are from the pen of C. Ansell, Jr., published in 1874. The author collected information concerning 48,044 children of the well-to-do classes in England and Wales, including members of the legal, clerical and medical professions, as well as that of the nobility and gentry. He found, from these inquiries, that in the first year of life, only 80.45 per 1,000 deaths occurred among the infants of the easy classes in that country, as against 149.49 among the children of the general population; but among the latter class the percentage went up to 240 in cities like Manchester and Liverpool, and as high as 300 in the poorer quarters of our cities, and in Berlin actually 500. From one to five years of age, 46.84 children of the upper classes die of 1,000 born, and as many as 113.69 in the general population. During the remainder of early youth from 5 to 20, the difference is not marked; but 65.47 per 1,000 deaths occur among the richer classes, as against 74.04 in the general public. Between 20 and 40 there die among the richer classes, 125 per 1,000, and 124 among the general population; and between 40 and 60 there die 147 per 1,000 among the rich, against 168 among the general population.

Theory of Life.—The late Prof. Faraday, adopted the theory that the natural age of man is 100 years. The duration of life he believed to be measured by the time of growth. In the camel the union takes place at eight, the horse at five, in the lion at four, in the dog at two, in the rabbit at one. The natural termination is five removes from these several points. Man being 20 years in growing lives 5 times 20 years—that is, 100; the camel is eight years in growing, and lives 40 years; and so with other animals. The man who does not die of sickness lives everywhere from 80 to 100 years. The professor divides life into equal halves—growth and decline—and these into infancy, youth, virility and age. Infancy extends to the twentieth year, youth to the fiftieth, because it is in this period the tissues become firm, virility from 50 to 75, during which the organism remains complete, and at 75 old age commences to last a longer or shorter time as the diminution of reserved forces is hastened or retarded.

The Use of the Right Hand.—The superior training of the right hand in the affairs of life is the heritage of ages. There are many operations which require the use of but one hand; and it seems but natural that in process of time that one should have taken the lead in their performance, and the tendency has been transmitted. Children generally show a disposition to use the right hand more than the left. We agree with you that we should be able to use both hands with equal facility. Some men do appear to be ambidexterous. There are anatomists who claim that the left hemisphere of the brain has a controlling influence in mental life, and for that reason the right side of the body is more exercised than the left. It is true that one hemisphere is more exercised than the other, and it is usually the left which dominates, but both are essential to completeness and harmony of mental operations.

Prevention of Boils.—A St. Petersburg physician, Dr. Sieven, commends a very simple treatment for the prevention of this painful form of abscess. He claims that if the skin be superficially scraped with a small knife, so that a drop or two of blood may be pressed through the epidermis as soon as the peculiar stabbing or pricking sensation and slight induration announce the commencement of the boil, it will not be further developed.

The Week.

Our spring weatber has made its advent among us, and has given somewhat of an elasticity in business circles, which would undouhtedly he flourishing did not local causes intervene with the effect of retardation.

From all portions of the interior favorable reports are received in regard to the incoming crop, and it is believed that it will be the most abundant one that California has had for several years. More acres have been seeded to wheat and harley than in any previous season, and when the addition to the wealth of the State is realized from the crops, better and more prosperous times will exist, despite all extraneous influences.

The mining outlook holds also a rich promise for the future, and with its yield of bullion added to the farmers grain, it will make "assurance douhly sure" in the healtby financial condition of the coming season.

An important item of interest this week is Col. Mendell's suggestion to the Chief of Engineers in regard to the *debris* question. After summing up the question briefly he recommends certain remedial measures consisting in forming at certain places storage dams for controlling the *debris*. He concludes his report as follows: "It is, therefore, respectfully recommended that an appropriation of $250,000 he asked of Congress, to he expended during the present year in the construction of storage reservoirs for mining detritus in the trihutaries of the Sacramento river, and in a further study of this question." It is to he hoped that Col. Mendell's suggestion will be approved and a corps of competent engineers take hold of the matter in earnest.

In general news there has been no other item of importance worthy of especial notice. Everything has heen quiet; even our Legislators, succumhing to the ruling quietude, have forgotten to indulge in the rather noisy but futile quarrels, with which they varied the monotony of their arduous law-making duties.

Edison and Tailings.

Mr. Edison has found tims, while working at electrical appliances, to turn his attention a little towards mining operations, it hsing the fashion nowadays in the East to look after mines occasionally. A company has heen formed cslled the Edison Ore Milling Co., and works are to be erected at some point in Butts county very soon.

We do not prstend to know very much about Mr. Edison's process, or even exactly what he is going to try to do. Mr. G. W. Cummings, who was Superintendent and Manager of the Newton Hydraulic Dredging and Mining Co. a year or two ago, is supposed to he Mr. Edison's agent. Mr. Cummings, although he had a very large dredge huilt, did not make a success of his machine, which, whils it appeared to work very well, didn't get any gold, or, at least, not enough to pay the expenses. It is to he hoped he will he ahle to do hetter with the Edison process, whatever it may he. Mr. Cummings tells the Oroville *Register* that the new proposed works are to "mill hlsck sand." He also says that Major McLaughlin, and a corps of practical chemists to manage the works, will he here this month. The New York *Postal Card*, in referring to Major McLaughlin, says: "Major McLaughlin has heen quite ill since his return from the Pacific coast, with throat trouhle, hut has been ahle to get out again and is preparing to return to California, where he will carry out his contracts under Prof. Edison's improved method of hydraulic mining."

In addition to the ahove information we have the following dispatch from New York, dated March 4th: "Edison's spare time is spent in perfecting his process to ohtain gold from tailings. He has organized a company and ohtained at Virginia and Leadville, 50,000 tons. The process is secret, hut quicksilver is known to enter, as also oxide of lead, carhonate of soda, charcoal dust and powdered glass. He has so well satisfied a number of mining engineers and capitalists that his claim is well founded, that a company has already heen organized to work over tailings cast off at the furnaces of a great many miues. It was learned yesterday that this company have already contracted for and secured 50,000 tons of this product among the mining districts of Virginia and Leadville."

It is hard to judge from this dispatch whether the telegraph is trying to make a fool of Mr. Edison or Mr. Edison thinks the mining men here are a pack of fools. The "tailings cast off at the furnaces" is good, but we never before heard of any of that particular kind of tailings. Quicksilver, oxide of lead, carhonate of soda, charcoal dust aud powdered glass, ought to hring the gold out of a grindstone. It might withstand some of these, hut the powdered glass will fetch it sure. The rest of the process is secret, so we don't know the other parts of the compound.

Now Mr. Edison is a great inventor, and bas shown a great deal of genius, hut we think he has his hands pretty full with the electric light. The experiments he makes in his laboratory with ores or tailings will do him very little good when he comes to work them in bulk and on a large scale. We don't helieve a man with no knowledge of so important a suhject as tbe metallurgy of gold and silver, will ever accomplish much in working ores. We do not hear that Mr. Edison has associated with him any practical mining man—anyone who has had experience in working ores.

We all acknowledge that we are unable to save all there is in ore in our gold mines. These ores usually leave very little margin for profit, and if expensive machinery or expensive chemicals are used, it will not pay to try to get more than a certain percentage. Over that percentage it cost more than it comes to.

We have had dozens and dozens of Eastern men come to this coast who were going to revolutionize our means of working ores. Each one had a special process entirely different from those in vogue. Each one was confident; each one got up a company, and each one failed. People have no confidence in new processes, especially wben they are tried in secret. Processes which will not stand the test of chemical investigation or research, will not stand the test of practice.

While we have great admiration for the genius of Mr. Edison in his special hranch of inventive research, we have very little confidence in his teaching us anything new about working gold ores. If he is going to add a lot of machinery to our methods of working, he will find it will not do. If many chemicals are required, and repeated handling of the ore, while he may get more than we now do, he will find the increased expsnse will not meet with favor.

Perhaps it is unjust to say much ahout Mr. Edison's process, knowing nothing more ahout it than the extremely vague and nonsensical dispatches tell us; hut many people suppose that hecause Mr. Edison has turned his attention to the working of ores, the difficulties of the operation will surely he overcome. We have no such feeling, and think it best to keep cool until Mr. Edison tells us what he is going to do and how he is going to do it, hefore concluding that the long-looked-for prooess has come at last. Mr. Edison's 50,000 tons of tailings do not amount to a drop in the hucket compared with what he can get *if* he can work them. Whether he can or not remains to be seen.

Inventors and the Public.

The only dspartment of the Government which is self-sustaining is the Patent Office. In fact it even pays a profit. Yet the Govsrnment pockets the surplus, turns it over to some needy snd expensive depsrtmsnt, and is then niggardly in giving proper appropriations to run the Patent Office as it should he. The receipts of this department have to hs turned over to the U. S. Treasurer. He simply gives hack what is appropriated hy Congress, and this is never as much as is wanted. Ths husiness of the Patent Office for 1879 was as follows: The nnmher of applications for patents was 19,300, and the uumher of caveats filed was 2,674.

Total receipts of office.....	$703,146.79
Total expenditures of office.....	548,651.47
Receipts above expenditures.....	$154,495.32

The Commissioner of Patents in his annual report, gives these figures, and after comparing the receipts and expenditures of the year 1879 with those of 1877 and 1878, says that the decrease in the expenditures has heen enforced hy the reduction of the sppropriations so far as to seriously cripple the office and injure public interests. And he further says: "The constitutional provision which confers upon Congress power 'to promote the progress of science and useful arts hy securing, for limited times, to authors and inventors the exclusive right to their respective writings and discoveries' evidently imports, not that the inventors are hateful monopolists to be taxed hy the Government, hut that they are puhlic benefactors to he encouraged and rewarded. That this is the true theory the experience of our people with their patent system during the past century ahundantly proves, notwithstanding the exasperating annoyances which, in many cases, have resulted from patents improvideutly granted hy the office, unconsciously used hy their owners, and unwisely adjudicated hy the courts.

"This heing the constitutional theory, and also manifestly the just theory of the relation of the inventors to the public, it is alike unconstitutional and unjust to maintain in its present condition the legislation affecting inventors, hy imposing upou them in future years the special tax which amounted, as has heen shown, to the sum of $154,495.32 during the last year. It is the ohvious requirement of justice and of the Constitntion that one of two things be promptly done, viz.: Either that the fees exacted from inventors he reduced to the amount which the patent system costs the Government, or that the surplus he expended in improving the facilities for the prompt and thorough examination of their applications and for the effectual performauce of the other work wbich they pay the office to perform."

The Commissioner recommends the latter course, which all acquainted with the Patent Office will endorse.

Leaching Unroasted Ores.

Mr. M. B. Dodge of this city bas been making some experiments of late in leaching ores without roasting, and finds that he obtains a very high percentage. Certain of the ores he has been working are now heing roasted before leaching, and they only get 65% and 70%, while hy Mr. Dodge's method, without roasting, he gets from 80% to 93%.

Some ore from the Columbia mine, Bull Rnn, Nev., has heen tested in this manner under Mr. Dodge's instruction hy Kustel & Riotte. According to their certificate the sample contained, according to fire assay, per ton in silver $106.81. The same ore treated, without roasting, hy a leaching process, according to Mr. Dodge's directions, assayed, after leaching, $7.37. This result shows an extraction of silver equal to 92.76% of the fire assay.

As hefore stated, this ore, as it is worked at the mine, has heen roasted hefore leaching, and under those circnmstances they get from 65% to 70%.

In another case carbonate copper ores from Arizona were tried. The sample assayed hefore leaching $65.98 per ton. After leaching hy Mr. Dodge's method the ore assayed $15.56. This result shows that 80% of the silver was obtained hy leaching without prevous roasting.

Mr. Dodge claims no patent on his process, and simply makes certain changes in the method of leaching. He claims that his system of leaching will work silver ores in almost any state except the sulphides. Ores may he worked with very little cost for works. Where part of the ore is sulphide, that nart may he concentrated after leaching, and the sulphides shipped or roasted and leached separately. He says that even with low-grade ores he can treat them at a profit hy the means employed.

CONSIDERABLE excitement prevails over reported valuahle mineral discoveries near Rawhide Buttes, Wyoming, which are about 140 miles north of Cheyenne. Recent assays made in Denver of surface rock are said to average 125 ounces of silver and $8 in gold per ton. A regular stampede to the new discoveries on the part of those who can secure transportation is now progressing.

BILLS have been presented in both houses of Congress to confirm the Stratton survey of the Puehlo of San Francisco.

Copper Resources of the Pacific Coast.

Our aim in this article is to present to our readers as comprehensive a statement as spacs will permit on copper: its antiquity, its various qualities in commsrce, classification of its different orss, a brief historicsl rsview of its discovery on this coast, and its pressnt condition of development.

Copper was well known to the ancients, and it was in nse long before the Delugs, for Tubsl Cain we are told was "an instructor of every artificer in brass and iron." Brsss was a very indefinits term among the ancients; ths simple metal copper and all the different compounds into which it entered as a principsl ingredient, heing comprehended under the same name. Uncivilized tribes have heen discovered ou the northwest coast of America and elsewhere making use of copper implements; axes and other instruments of bronze have been found in tombs of the ancient inhahitants of Mexico and Peru, and from the latter country Humholdt took a chisel which Vauquelin ascertained to consist of .94 copper and .06 of tin. This alloy was so well forged that it had a specific grsvity of 8.815. The bronze of an ancient Grecian helmet was found on analysis to he copper alloyed with 18.5% of tin. An ancient dagger analyzed hy Heilm was found to contain about five parts of copper and one of tin; and other analyses of ancient weapons found in countries widely distant from each other have afforded much the same result.

Pure copper is of a reddish brown color, and of a high luster. It is one of the most ductile and malleable metals, and can he hammered or rolled into thin sheets or drawn into moderately fine wire. Its specific gravity when cast is 8.91, in wire 8.93, in sheets 8.95. Copper melts at a temperature of 1996° Fahr., or above the fusing point of silver and below that of gold. The usual

Impurities Occurring in the Copper of Commerce

Are iron, arsenic and silver—in small quantities almost invariahly; hismuth very frequently except in Russiau and Australian specimens; tin, antimony and sulphur occasionally, and lead almost invariahly in sbeet or holt copper, but not in cake coppsr; with nickel, cohslt and gold less frequently. The variety known in commerce as hest selected is very nearly pure; while tile copper and tough cake usually contain traces of arsenic, iron, sulphur, tin, nickel, etc. The effect of iron is to render the copper harder and paler in color; sulphur and antimony likewise harden copper, make it grayer in color and impair its malleability and tenacity. Copper containing only 10 oz. of antimony per ton is stated hy Dr. Miller to be quite unfit for use in the preparation of hrass intended for rolling. Arsenic in small quantities hardens tbe metal, hut does not impair its malleahility to the same extent as antimony. Small qsantities of lead are occasionally added to copper intended for rolling, hut the addition of only small quantities—one to two per cent.—of this metal, renders copper nnfit for the manufacture of hrass plate and wire.

Best selected is the name applied to the puror varieties of commercial copper, as required in the manufacture of hrass, for sheets and wire, such metal being especially freed from tin, arsenic, iron and sulphur. Russian copper generally contains traces of iron, hut in other resnects is exceedingly pure. The native metal occurring in the neighhorhood of Lake Superior is usually very free from impurities, hut occasionally specimeus yield .0003% of silver. Chilean copper, as imported into this country, occurs in the form of bars weighing ahout 200 pounds each, having a composition analogous to the Welsh "pimple" or "hlister" copper, and which accordingly requires to be refined, or mayhe hoth roasted and refined, hefore it is ready for general use. The *rosette*, or Japan copper, is a variety of commercial copper, the surface of which presents a peculiar red color. It contains a considerahle amonnt of red oxide, and has a dull, red-short fracture. It requires refining hefore it can he hammered or rolled. Bean-shot and feather-shot copper are varieties ohtained in the form of small globules and flakes respectively, convenient for the hrass founder's use, and prepared hy running the melted copper through a perforated ladle into hot water for the production of hean-shot, or into cold water if feather-shot he desired. Cement copper is the name applied to the almost chemically pnre variety of copper ohtained hy the prccipitation process as conducted at Anglesea (North Wales), Hungary, and even until lately at Melrose.

Ores of Copper.

Copper occurs very ahundantly, and in a variety of forms. The ores of this metal occur in rocks of almost all ages, hut most abundantly in the Lias and Permian formation; yet in all copper veins, oxides, more or less green, are found on the surface, which, in connection with other marks, form a sure indication of the presence of copper ore.

Native conper is found in isolated masses, sometimes of considerahle size, and also in heds, veins, in solid rocks and imhedded in loose soil; it is distrihuted over the whole surface of the globe, hut nowhere is it found more generally and in larger masses than in the United States. Masses of native copper of 80 tons weight have heen excavated in the Cliff mine at Lake Superior; it occurs in trap or sandstone rock in

the form of injected veins. The origin of the metal appears to be from veins whose ores have been reduced by the heat of the volcanic rocks. But the chief sources of copper are the following ores:

1. Gray sulphide of copper, copper glance or red-white and purple copper, are sulphides of copper occurring largely in this State, in Nevada and also in Arizona and elsewhere, and it is profitably mined in many localities. Copper glance when pure consists of 77.7 copper, .91 iron, 20 sulphur and some silica.

2. Gray copper ore or fahlerz is a steel-gray or iron black, brittle mineral, occurring both massive and crystallized in cubic forms. The composition of this ore varies greatly, but on an average it contains from 25% to 40% of copper, from 20% to 30% of sulphur and nearly as much antimony.

3. Copper pyrites or yellow copper ore, a compound of copper, sulphur and iron; it forms the ore from which about five-sixths of the copper produced in Great Britain is obtained; this ore is of a brass-yellow color, distinguished from iron pyrites—which it greatly resembles—by its inferior hardness.

4. Blue carbonate of copper contains 55.16% of copper.

5. Green carbonate of copper or malachite contains 57% of copper, and it is distinguished by its fine, emerald-green color, with a luster inclining to resinous. It occurs along with the blue carbonates almost in every country.

6. The black oxide contains, when pure, 79.8% of copper, but it is frequently very impure.

7. The red oxide contains 88.78%, and it is found massive or granular, frequently iron-gray on its surface, but always affording its characteristic reddish-brown streak.

The existence of copper on the Pacific coast was well known for many years before California became a State. The ores of this metal are known to have been found in Mexico at various points, in great abundance, for centuries past. But the first officially recorded

Discovery of Copper in California

Since it became a State was made by Dr. J. B. Trask, who acted as State Geologist from 1851 till 1854. During that time, in the course of his travels, he found copper in nearly every county of the State, the first discovery, however, being made near a place then called Round Tent, in Nevada county. But very little attention was paid to it until the summer of 1855, when public attention was again called to the fact of the existence of copper in this State by the discovery of a body of beautiful ore at Hope Valley, Amador county, by an old prospector known as Uncle Billy Rodgers. About the same time a party of prospectors in El Dorado county found a large body of green and blue carbonates on the side of a hill a few miles from Placerville, and, attracted by the brilliant colors of these minerals, collected several sacks full of them and sent them to San Francisco, where, by assay, they were found to contain 40% of copper, and worth about $140 per ton; but these discoveries were soon forgotten in the more exciting search for gold, which occupied almost everybody's attention at that time, and the *now* great copper resources of the Pacific coast remained without an effort being made for their development till November, 1860, when Mr. Hiram Hughes, while prospecting for silver among the foothills that margin the Valley of San Joaquin, discovered—without being aware of the fact—the gossan or cap of a copper lode, on what is now known as Quail Hill No. 1—an insignificant mound among the gopher hills in the southwestern portion of Calaveras county, about 35 miles southeast from Stockton. This gossan, which presented much the appearance of a body of iron rust, held together by a frame-work of quartz, was found to be very rich in gold, and it was for this metal only that Hughes worked his claim.

Soon after, while making further explorations for "iron rust," he discovered the croppings of what is now known as the Napoleon mine, about three miles southwest of his first discovery. As there was less gold, and considerable of what was then to him an unknown mineral, in this place, he sent a lot of the ore to San Francisco, where it was pronounced 30% copper ore and worth about $120 per ton. As soon as this became known, there was a great excitement, and everybody began prospecting for "iron rust," and as the indications of copper were to be found almost at any point of the Gopher hills, hundreds of claims were speedily marked out and recorded. But as none of these mines except the Napoleon ever produced much marketable ore, work on all of them very soon ceased.

Notwithstanding the great amount of prospecting that followed Hughes' discovery, it was not until some time in June, 1861, that the lode, on which the mines at Copperopolis are located, was discovered, though it was only about six miles from the Napoleon, and the locators of the Union, Keystone and other mines were all old residents in the vicinity. Many interesting and instructive facts might be here introduced to exhibit the ignorance of the parties who first discovered these important mines as to the value of their property, but the limits of this article would not permit.

Before the close of the year 1861, also, a well-defined belt of copper ore, containing several distinct lodes, was traced and partially developed, from a point about 30 miles north of Los Angeles, at La Soledad, through Mariposa, Merced, Fresno, Tuolumne, Stanislaus, El Dorado, Placer, Nevada, Yuba, Trinity, Sierra, Plumas and Shasta counties, to a point about 20 miles west of the town of Yreka, in Siskiyou county, where it enters the State of Oregon in a northern spur of the Siskiyou mountains, the most western branch of the Sierra Nevadas. The results of all these discoveries, were the location of thousands of claims, some of them of considerable importance, in nearly every county in the State, and the incorporation of a countless number of copper mining companies, and for a while the development of the copper resources of the Pacific coast was prosecuted with great zeal. But, however, a few years' experience taught those most deeply interested in the business, that with unskilled management and expensive labor, uncertain and costly transportation, and a great distance from a market for the final disposal of the ore, it is unprofitable to work the richest and most extensive copper deposit in the world.

Copper Smelting Works.

Numerous plants have been proposed and tested for the purpose of smelting and concentrating the copper ores found on this coast, none of which, however, have been entirely successful, though several of them have been partially so. A detailed description of all these various processes and of the furnaces and apparatus used, while it might be both interesting and instructive, would be out of place in this article.

The first copper smelting works—which were of an experimental character—were erected at Antioch on the bank of the San Joaquin river, near the base of Mount Diablo, for the purpose of testing the adaptability of the coal obtained in that vicinity for smelting purposes.

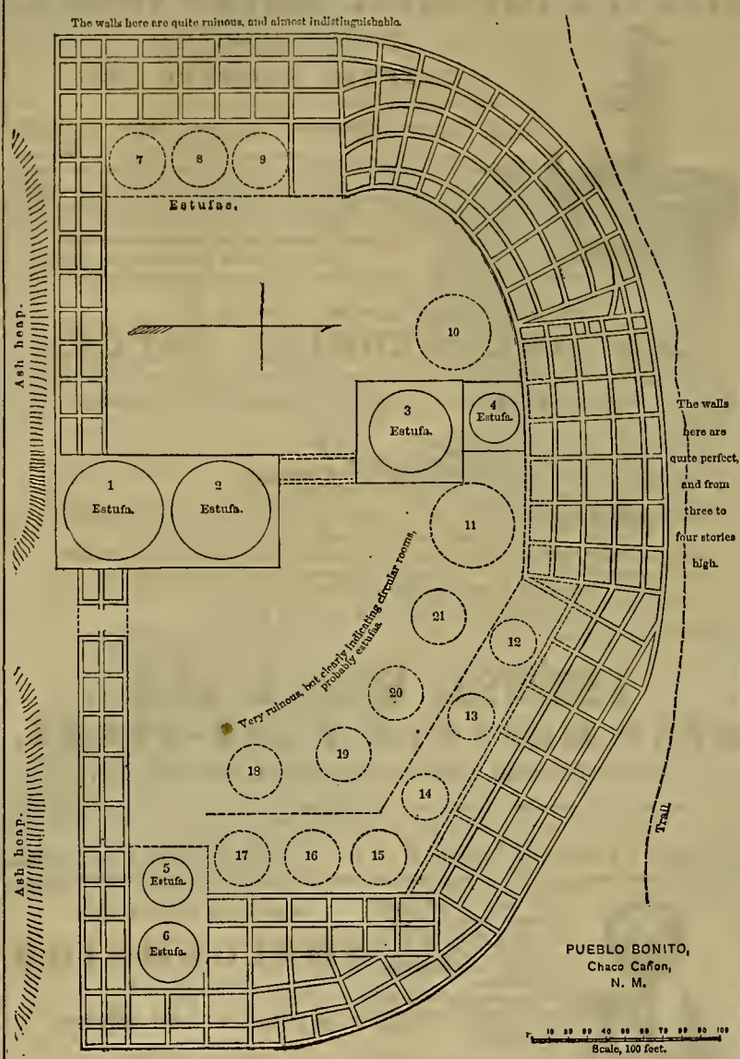
Other smelting works were erected at the Union mine at Copperopolis on a more extended scale than those at Antioch. The smelting works at the Cosmopolitan mine, at Genesee Valley, Plumas county, are constructed on the plan described by Piggot in his work on copper. Several other concentrating, leaching and smelting works have been erected of a novel and very economical and useful character on this coast, the different processes of which we shall probably describe in a future article. Some of these we have described lately.

The present condition of copper development on this coast, as well as on all the Pacific slope, is not so encouraging as it ought to be; but the absence of any correctly compiled statistics, the indisposition of influential parties to give any information, and the unreliable nature of most of the articles which from time to time appear in the local papers, as well as many minor impediments, render it exceedingly difficult to convey a clear idea of the condition and actual value of these important resources.

There are now thousands and hundreds of thousands of tons of copper ore lying idle, and have been so for several years, on the dumps of the various claims in this State as well as in Nevada, waiting for a remunerative system of treatment. There are indeed some hundreds of tons of sulphides which we know of in San Joaquin valley, that assay at an average of 12%, which are too low-grade to be shipped to Swansea, and therefore have no market. There are oxides, blue and green carbonates, not a long distance from this city, 14 different samples of which, assayed not long since, contained an average of 38% of copper. A vast amount of ores of this quality are now lying idle on the dumps, and command no market. There are indeed mountains of its resources locked up in our rocks and hills, waiting for the golden key of the capitalist to open them. There are here all the facilities in the world for this vast wealth to be developed: a number of claims already opened and in good working order, plenty of men in want of employment, and ores in abundance and easy to work.

Work on Mining Claims.

We gave two weeks ago the provisions of the amendments to Sections 2324 and 2325 of the Revised Statutes of the United States, relating to the date of work on mining claims, and allowing agents to make affidavits for our residents.



The walls here are quite ruinous, and almost indistinguishable.
Estufas.
Ash heap.
Ash heap.
Very ruinous, but clearly indicating circular rooms, probably estufas.
The walls here are quite perfect, and from three to four stories high.
Trail
PUEBLO BONITO,
Chaco Cañon,
N. M.
Scale, 100 feet.

Under the provision of the law, as it has been standing on the statute books, the date within which it was necessary to do the work on a claim was a matter of some doubt. For instance, a man would locate a claim June 1st, and perform his expenditures on the following June 1st, or just before the year was up. The work done at that time, therefore, could hold the claim till the end of the next year, since he might come at any time to do the work for that year. A few days' work would therefore hold the claim two years. In fact, the Section presenting annual expenditures was so vague that it was necessary to amend it. The amendment is specific and clear, and there is no misunderstanding it at all. The following words are added to the law as it stands: "*Provided*, That the period within which the work required to be done annually on all unpatented mineral claims, shall commence on the 1st day of January succeeding the date of location of such claim, and this Section shall apply to all claims located since the 10th day of May, A. D. 1872." This is plain and to the point. The year runs from January to January, and not from date of location to same date in next year.

IRON ore is being shipped from the McCloud river, near the United States Fishery, to San Francisco.

Aztec Ruins in New Mexico.

We have in recent numbers given illustrations and descriptions of the ruined Aztec towns in New Mexico. These ruins are highly interesting, as showing the state of civilization of this ancient race. The ruins of Pueblo Bonito, illustrated herewith, are the largest, and, in some respects, the most remarkable of all. Its length is 544 feet, and its width 314 feet. By referring to the plan it will be seen that it only roughly approximates the usual rectangular shape. The two side wings are parallel with each other, and at right angles with the front wall. The left-hand wing consists of three rows of rooms, 8 in each row, 12 to 15 feet wide and from 12 to 20 feet in length. The outer walls are entirely demolished, but some of the interior walls reach to the top of the second story. In front of this wing and facing the court are the remains of what was probably three circular, partially subterranean rooms, probably *estufas*. The section adjoining this wing is in the shape of an almost perfect quarter-circle, and consists of five tiers of rooms, with nine rooms in each.

The walls are standing quite generally as high as the second story. The middle section is the most ruinous of all, but the great depth of the *debris* which covers several perfect rooms indicates that it originally possessed an equal hight with the adjoining walls. The outer wall thus far is entirely ruined, hardly a stone remaining in place, but in the section that lies between the central line of *estufas* and the right-hand wing it rises up to the fourth story, and is in a remarkably well-preserved condition. Several of the interior parallel and transverse walls are also standing fully 30 feet high. Many of the *vigas*, which are in excellent preservation, still retain their places and protect a number of rooms on the first floor. The outer wall of the east wing is in fair preservation, while the interior walls are in excellent order for at least two stories; the apartments in this and in the adjoining section are of unequal size, and the walls of the ground-floor are of a firm massiveness that has preserved them remarkably well. Within this wing are two *estufas*, one of which came up with and formed a portion of the second story. Across the front of the court there are two tiers of rooms about 25 feet in width, their fallen walls making a mound of *debris* 5 to 8 feet in depth, indicating that they were of considerable hight. Every transverse wall could be easily distinguished. Interrupting this about midway is a solid parallelogram 65 by 115 feet in dimensions, in which are two *estufas*, each 50 feet in diameter.

Legislative Matters.

Since our last issue, very little of interest to miners and mechanics has transpired at Sacramento. The Legislature has many knotty problems before it, and a good deal of its time is taken up with choking off special and crude legislation. Bills which should never see the light are introduced, considered, argued and debated at a cost of time and money, which must be aggravating to those members who are working with intelligence and good faith.

An act has been introduced to pay Jamee W. Marshall $1,200 for services rendered in the discovery of gold in California.

An attempt was made this week to reconsider the action on the Boiler Inspector bill, but it was voted down.

The famous Revenue and Taxation bill finally passed the Senate this week by a vote of 24 to 15. It now rests with the Governor.

Maybell has introduced a bill providing for an income tax as follows: Income of $2,000 and less than $3,000, 1%; $3,000 and less than $4,000, 1½%; $4,000 and less than $5,000, 2%; $5,000 and less than $6,000, 3%; $6,000 and less than $7,000, 4%; $7,000 and less than $8,000, 5%; $8,000 and less than $9,000, 6%; $9,000 and less than $10,000, 7%. Over $10,000, 10% upon excess of increase over $2,000.

The bill providing that the several agricultural societies in the State shall be State institutions, in order to bring them within the provisions of the Constitution, and enable them to receive appropriations, has been amended so as to meet an objection which had been urged against it. It was found that the bill as drawn, allowing the Governor to appoint Directors, would substantially make them political institutions. As amended the bill confines the appointment of Directors by the Governor to persons recommended by the members of the societies.

"THE 'TRUE' AND 'FALSE' WORKMAN."—Freeman Lovell, of San Francisco, will lecture on the above subject in the popular course of free lectures in Oakland, Sunday evening, March 14th. Few who listened to Mr. Lovell's recent able lecture on "Balance Wheels," will fail to attend.

IT appears that the iron piers built during last spring at Coney Island and Long Branch are proving that they are fully capable of resisting the storms raging during the winter on our coasts. The success thus obtained will no doubt largely encourage the construction of similar works.

THE EMPIRE MINE CLOSED.—Owing to disagreement between the employees and owners of the Empire coal mine, work has been suspended and the mine closed for an indefinite period. The facts of the case are these: The owners agreed to pay the miners one dollar per yard for cutting coal at the time the mine was first worked. This was and is considered good pay, and miners working full time could make handsome wages at this price. Business being dull, something over a year ago, Mr. Belshaw, the manager, told the coal cutters that, as they were employed only a portion of the time, 8 to 10 days in the month, he would furnish boys to dump the cars, taking coal from the breasts to the gangway. This was a gratuitous offer on the part of Mr. Belshaw and was made through charitable feelings only. Since then he has continued to furnish this extra help until a few days since, when orders were given that hereafter, as the miners were now employed from 15 to 20 days in the month, they must furnish coal in the gangways for one dollar per yard. They demanded as a right that which was benevolently accorded them, namely, the services of the boys to assist in dumping the coal. The next morning they refused to go to work. Messrs. Belshaw and Rouse called a meeting of the miners and fully explained the situation of affairs, and stated exactly what business had been done since opening the mine. The miners held a subsequent meeting and instructed their committee to report that they still adhered to their determination not to go to work, whereupon Mr. Belshaw gave orders to pay off the men and suspend operations. By thus closing the mine 125 men are thrown out of employment. It affects our merchants and business men materially, as the company paid from $8,000 to $10,000 monthly to the employees. It is to be hoped there may yet be an amicable arrangement made and work go on, but there is no indication that operations will be resumed at present.—*Antioch Ledger.*

Scientific Press **Patent Agency.**

[ESTABLISHED 1860.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other Agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 202 Sansome St., S. F.

Kendall's Spavin Cure

Is a sure cure for spavin, splint, curb, callous, sprains, swellings, galls, lameness and all enlargements of the joints or limbs. It will completely remove a bone spavin without blistering or causing a sore. It is also as good for man as for beast, and is used full strength at all times of the year with perfect safety. A cure which we are willing to in person who suffered 15 years with hip-joint lameness and was permanently cured two years ago with Kendall's Spavin Cure. Remember we claim it will cure a bone spavin and completely remove the bunch without blistering.

Office U. S. Marshal, Western Dist. of Michigan, Kalamazoo, April 15th, 1879.

B. J. Kendall, Enosburgh Falls, Vt.—DEAR SIR.—I received the two bottles of your Spavin cure forwarded by express in January last. I am happy to state that it performed all your advertisement called for. In three weeks after I commenced using it the spavin was entirely removed and a valuable horse restored to usefulness. Very truly yours, JOHN PARKER.

Send for illustrated circular giving positive proof. Price, $1 All Druggists have it or can get it for you.

Ingersoll Rock Drills.

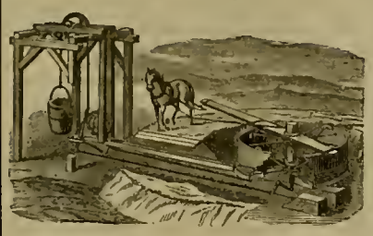
In use in the largest and best Mines of the Coast.

HAS AUTOMATIC FEED.

Has less Repairs.

Is Lighter and more Easily Adjusted than any other Drill.

Our DRY AIR COMPRESSORS are the most Economical Compressors in the Market.



MINERS' HORSE-POWER.

This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.
The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing

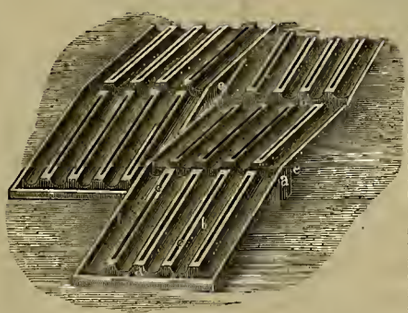
Howland's Under-current, Mill and Sluice Riffle.



This invention meets a want which has long been felt by Gravel Miners and Millmen, viz.: that of a simple, cheap Riffle which will save the largest possible amount of gold or sulphurets, with the least possible waste of quicksilver. That this Riffle answers all these conditions will be apparent to any practical man who takes the trouble to examine it. The arrangement of this Riffle is such that there is a strong, unobstructed upper-current to carry off and break up the gravel or cement, and a slow under-current, checked by numerous riffles, which give gold or sulphurets a better opportunity of settling than if they were exposed to the force of the main current.

In this Riffle there are cast troughs for the quicksilver, which extend entirely across the sluice, and while they are so placed that the current will naturally pitch towards them, and give every opportunity for amalgamation, the quicksilver is fully protected from flouring or leakage. There is no mechanical skill required in taking out or replacing the sections.

Full particulars in regard to this invention can be obtained by applying to

STEIGER & KERR, of the Occidental Foundry, 137 First St., S. F.,

Who have the sole right of manufacturing this Riffle, and who will receive and attend to all orders.

GEO. S. LADD, President. ANDREW WHITE, Secretary.

A Card from Architects.

The California Architect and Building Review.

Office, No. 240 Montgomery Street, San Francisco, Cal.

It is with pleasure that we publish the following from prominent Architects in this city:
Believing that a journal of its kind is a necessity on this coast, and judging from what has appeared in the "Quarterly Architectural Review," we are led to believe that the CALIFORNIA ARCHITECT AND BUILDING REVIEW will be worthy of generous support and encouragement. We therefore pledge our cordial sympathies, personally, and hope that the enterprise will receive kindly recognition and liberal support from all Architects and Builders and the public generally. (Signed) David Farquharson, Wright & Sanders, S. H. Williams, Thos. J. Welsh, P. Huerne, John Marquis, B. McDougal & Son, Wm. Moeser, Wm. Curlett, Meeker & Banks, W. C. Hoagland, S. & J. Newsom, B. Henrickson.

AN ENGINEER,

Favorably known in the East, desirous of settling in California, seeks position as Superintendent or Chief Draughtsman. Competent to design Stationary, Marine, Locomotive, Mill Work, Sugar and Hydraulic Machinery. Speaks Spanish. Unexceptional references. Address EXPERT, this office.

CONTINUED FROM PAGE 165.

SANTA CATARINAS ITEMS.—The American Flag has reached a depth of 63 ft in a well-defined three-ft ledge of high-grade chlorides and carbonates. It is a true fissure vein. The Pilot struck a rich body of black sulphuret ore showing free gold and native silver. The Blood Sucker is opening up large bodies of ore, both in gold and silver. Large boulders of ore on their dump are no uncommon things to see, which fairly bristle with "chispas" of bright yellow metal.

SILVER DISTRICT ITEMS.—Yuma *Sentinel*, Mar. 6: The Melissa has a tunnel of 91 ft. A shaft has been sunk in it 34 ft. They have 70 tons of first and second-class ore on the dump. The ore assays very high in silver and lead. This ledge joins the Rover on the south. On the Amelia an extension of the Rover on the north a 200-ft shaft will be commenced. The Nellie Kenyon has been bonded for $10,000. The Black Rock is down 130 ft in metal at the bottom that will average $200 per ton. An assay shows a value of $252.90 per ton. The Iron Cap crosscut at 200 ft is in 10 ft, on ore, and still going.

SALERO CAMP ITEMS —Tucson *Record*, Feb. 28: The Lost has a shaft of 100 ft in depth. At 50 ft levels east and west are being run, in free milling ore, chlorides and horn silver, running as high as $4,000 and $5,000. It will average on the ore streak something over $100. The Red Cloud shows a fine body of free milling chloride ore from the surface down to the present depth, 85 ft. The general character of ore in this district is chlorides, copper, silver glance, horn silver and some carrying a small percentage of galena. The formation is syenite and porphyry, the ledges sometimes being capped with manganese.

COLORADO.

TROPIC.—Georgetown *Courier*, Feb. 26: The last carload shipped milled $142 per ton, a part of it being from the shaft and the remainder from the upper workings. The main shaft is now 155 ft deep, and 65 ft below the level. A new level was started from the bottom both east and west. The shaft shows a continuous ore vein from this level down, which increases both in size and value with depth.

WHITE.—Since last August this mine has paid all expenses with one-half the product. The Cleary adit is now 180 ft long. A fine body of ore was opened at the breast from 6 to 12 inches in thickness and of a high grade. The Swartz shaft has been sunk to a depth of 170 ft. Above the first level, 55 ft from the surface, a vein of two ft in thickness, one-fourth of which is a smelting product. The level has been driven 100 ft towards the Boulder Nest and two-thirds of the distance has been worked out to the surface. The first-class ore from this shaft mills from 150 to 200 ounces, and the concentrations about 90 ounces per ton.

FREE AMERICA.—The shaft is 552 ft in depth; the eighth level, at 540 ft, is started, there being a three-inch vein of lead ore to commence on and a vein 15 inches in thickness, with galena in sufficient quantities to make it worth from 50 to 70 ounces per ton. This can be seen in all the workings below the third level, a depth of over 300 ft, and as far east and west as the levels have been run. The seventh level, 60 ft above, is being driven east and west, the east level being 70 ft and the west 25 ft in length. The galena in the quartz vein, which is assorted for a smelting product, mills from 200 to 300 ounces per ton. The sixth level, at a depth of 430 ft, has been opened west of the shaft 50 ft; and the fifth level, 50 ft above, has been opened east 50 ft. The fourth level is 270 ft from the surface, and has been opened easterly 170 ft. The vein of milling ore in the back stope is 12 inches thick. From one-fourth to one-third of the vein is a smelting product that mills from 200 to 300 ounces in silver per ton, the remainder being a concentrating ore that millsfrom 60 to 80 ounces. The second level is 150 ft from the surface, where a winze is sunk about 50 ft west of the shaft. It is 30 ft in depth, and shows a vein of smelting ore from top to bottom that will average six inches in thickness, and mills, when dressed, from 200 to 300 ounces per ton.

MONTANA.

GAGNON.—Butte *Miner*, Mar. 2: During the past week important developments have been made. Six weeks ago the 150 level was at the foot of the main shaft, which is now 90 ft deeper on the north side of the ledge, which a crosscut has proved to be of a very superior character. The crosscut extends five ft into the vein from which ore is taken assaying 300 ounces in silver per ton, and carrying a high percentage of copper. There is a 20-ft vein of $300 rock exposed. From a point distant 20 ft from the shaft a level has been started west 75 ft below the No. 3 level.

ALICE.—About 50 tons of ore per day are being extracted, ranging in value from $60 to $80.

MOOSE.—Is producing excellent ore. From the incline shaft, in which a four-ft vein of ore extends from top to bottom, a distance of 42 ft, ore has been taken which assayed $191.97 for the first-class or base ore, and $92.34 for the second-class ore, which is free milling. About 30 ft east of the discovery shaft a shaft has been sunk 80 ft and a crosscut commenced to tap the ledge. The Moose is situated a few hundred ft south of the eastern end of the Magna Charter.

MAGNA CHARTER.—The contractors have started a crosscut from the footwall of the ledge to connect with shaft No. 3, distant about 1,350 ft east from the mouth of the tunnel.

GRAY ROCK.—Is yielding about 12 tons of ore daily. On the 80 level a contract has been let for an extension of 100 ft. Seven ft of ore is being taken out on the hanging wall, though the vein is much wider than seven ft. This level is 20 ft below the water line, and some of the base ore extracted resembles that taken from the Alice on the 500 level. It is yielding free ore, of which a vast amount is in sight in the upper workings.

HIGH ORE.—The shaft is 115 ft deep, from which two levels have been run. The first, which, from a point 70 ft down, runs east 150 ft, has yielded a vast amount of ore, and has as yet a great deal in sight. Forty-five ft further down the second level has been run, and extends both ways from the shaft, with a total length of 100 ft, showing a continuous body of free-milling ore, averaging about 30 ounces. The level is in ore on top, sides and bottom. In the east end a crosscut was run 18 ft, proving the ore body to be as wide as that. About 50 ft east of the main incline a wing shaft has been run and the ore stoped out, with a great deal to be extracted. Since last May the property has yielded 1,700 tons of ore.

BELL.—The work is prosecuted through the middle one of the three shafts. Free ore has been taken out of the first level at a depth of 40 ft, and extends east 40 ft and west 100 ft. The second level, 70 ft below, is being pushed east and west. In the west level the ore body is five ft wide. The ore is rich in silver and copper, carrying 80 ounces of the former and 35% of the latter. In the west or main shaft, which has a depth of 145 ft, the vein carries a high percentage of copper and assays well in silver. Thirty tons contained 47% copper and 40 ounces in silver; 1,500 tons having the average value of $60. One hundred and fifty ft south another ledge is worked, on which two shafts are sunk. The east shaft is down 80 ft and shows ore from 20 to 30 ft in thickness, which assays from 12 to 140 ounces in silver. The average value is 25 ounces, and 600 tons have been worked. In the east shaft, at a depth of 70 ft, three ft of ore of a somewhat inferior grade has been opened up.

GLENDALE.—The furnace is turning out 1,500 ounces of silver per day.

SILVER BELLE.—Helena *Independent*, Feb. 26: Is located at the head of Poor Man gulch, 18 miles from Lincoln. The ore assayed 201 ounces of silver and $126 in gold to the ton, and there is a five and one-half ft vein of that kind of rock.

PENOBSCOT.—Seven thousand dollars gold bullion is the result of two weeks' run upon the ore.

MOUNT PLEASANT.—Has an eight-ft vein carrying gold and silver in large quantities.

OREGON.

MINING NOTES.—Jacksonville *Times*, Feb. 27: Johnson & Allison, on Jackson creek, are busily at work with a good supply of water. It is quite probable that much prospecting for quartz mines will be done next summer. Eckelson & Chappel and Gin Lin are running day and night, as also are most of the other hydraulic claims. Superintendent Lackland, of the Palmer creek diggings, will make a clean-up this week, and we expect to hear a good report from him. Beck Bros. have their claim on Applegate in good shape this season, and expect to make a profitable run. They are busily engaged in ground-sluicing. Thomas P. Kahler picked up several small nuggets in the Fort Lane diggings the other day, one of which weighed $17. As the bedrock is neared the prospects become better and nuggets more numerous. Mr. Benner proposes sinking down 50 ft further on the Ralls quartz ledge in the Willow Springs district this summer, which will make the prospect shaft 100 ft deep. He is of the opinion that it will prove well-defined and valuable.

UTAH.

SUPERIOR.—Salt Lake *Tribune*, Mar. 5: Has drifted 125 ft through ore without discovering hanging or footwall. This is undoubtedly the mother gold vein of the Wasatch.

CRAMPION.—Adjoining the Horn Silver, and promising to develop into as good a property, was sold to Chicago parties on Monday, the price paid being $250,000.

PARK ITEMS.—*Mining Record*, Feb. 28: Prospecting for lead ore on Scott hill is being pushed ahead, that good fluxing material may be ready when the smelter is completed. The work of grading for the smelter has been pushed as fast as the weather would permit. Work on the Silver Chief, on Bald mountain, the claim in contest with the Wasatch, will be commenced as soon as the snow settles. Prospectors are making their calculations for as early a start in the spring as possible. Even now, with the snow from 5 to 20 ft deep, locations are occasionally made by digging through the snow, where ledges were known to exist before snow fell. The coal prospect in Cedar creek is about seven miles from Heber. It was discovered by George M. Makin, an old and thorough coal prospector, and every indication is there for six ft of coal. In the Ontario work has been suspended on account of the mill shutting down. Sinking for the 700 level will be continued in the new shaft; 40 ft further will complete the work.

EMPIRE.—Has just reached its 400 level. From the 300 level down the shaft has three compartments well timbered. Above the 200 and 300 levels the work of raising on the incompleted compartment will progress rapidly. On the 100 and 200 levels the vein has been reached by a drift, and followed east and west a considerable distance. On the 300 level the drift has not yet reached the vein. At the 400 level the largest station in the district will be made. Its dimensions will be 30 ft long, 20 ft wide and 12 ft high. The vein continues through the workings in the west end of the drift on the 100 level; it has pinched from several ft in width to 10 inches, the assay value being much higher than in the east end. On the 200 level, immediately below the pinch in the west end of the 100 level, the vein is 15 to 17 ft wide, with good pay ore of four ft. The average width of the vein is about six ft, and the ore has averaged $35. Some ore has been taken out that will go $500 and $1,000. In the face of the drift running east on the 200 level, work has been suspended, as there is as yet no ore house. The ore is too good to be removed until a place for storing it has been erected.

FAIRVIEW.—Is sinking a 200-ft incline on the vein. The vein has been stripped, exposing ore all the way down. Fifteen samples from the bottom of the shaft, in eight-ft ore, assay $23.33½ in gold and silver, there being $3 in gold. A third assay of ore from the same depth brings the average of $26.50.

UTAH MARBLE.—There are 20 tons of marble at the mill and 40 tons already for transportation from the quarry to the mill. The quarry shows an inexhaustible supply of marble, and all over the mountain it crops out so plainly that the layers and seams in many places are visible. There is scarcely any difficulty encountered in quarrying it. Its clearness and whiteness when polished will create a great demand for it.

WHITE PINE GULCH ITEMS.—The Friday tunnel, situated northeast of the Jones, is being driven to cut the vein at a depth of 400 ft. The Mountain Top mine will run a 400-ft tunnel, cutting the ledge 500 ft deep. The Great Basin tunnel has been driven 200 ft this winter, and 100 ft further will strike a rich body of ore. The Great Basin is the first extension east of the White Pine mine. The tunnel is 1,200 ft lower than the present working shaft of the White Pine, its mouth being 1,200 ft from the end stakes of the latter mine. It will thus be able to work the two mines for several years without machinery. The White Pine shaft is down nearly 300 ft. A winze will be raised from the 300 level to the surface for ventilation, and manways will be made for escape in case of danger.

News in Brief.

IN Van, Armenia, 52 persons have died of starvation.

DE LESSEPS has left Washington for San Francisco.

PARIS is to present Prof. Nordenskjold with a gold medal.

THE cold weather still prevails in upper British Columbia.

THE Vancouver Coal company's miners at Nanaimo are on a strike.

JULIUS BEER, proprietor of the London *Sunday Observer*, is dead.

THREE HUNDRED amnestied communists have arrived at Brest, France.

THE winter wheat crop in portions of Wisconsin is pronounced a failure.

THE Weston-O'Leary walking match began in this city on Monday last.

FOUR Mussulman villages have been burned by order of a Russian officer.

THE negotiations with the Ute Indians have been concluded at Washington.

COUNTERFEIT $100 bills on several Eastern national banks are in circulation.

THE death of Commodore Isaiah Hanscom, U. S. N., is announced from Washington.

RICH mineral discoveries are reported near Rawhide Buttes, 140 miles from Cheyenne.

THE return of Hartmann, the nihilist, to Russia, is refused by the French government.

CHARLES COLBY was hanged at Santa Cruz Friday last for the murder of Harry Williams.

THE death of ex-Congressman, George W. Kettridge is announced from Newmarket, N. H.

THE Danforth Locomotive and Machine Works at Paterson, N. J., were recently destroyed by fire.

ROGER B. CONANT has been sentenced at Boston to seven years' imprisonment for embezzlement.

FOR insulting President Grevy and Waddington, a Paris newspaper has been fined 1,000 francs.

A STEAMSHIP from New York to Liverpool lost overboard seventy head of cattle on the voyage.

H. E. BROWN, one of the Mendocino outlaws, was found guilty at Ukiah on Saturday last of murder in the first degree.

THE would-be assassin of Gen. Mslikoff was executed at St. Petershurg in the presence of an immense concourss of people.

IN order to afford Bismarck relief from his arduous duties, Count Von Stalherg Wernigrod is to he appointed Prussian Premier.

A VIOLENT gale occurred in Ohio, Indiana and Kentucky Friday last, doing much damage to property and causing the loss of several lives.

IT is possible that a crack French regiment will visit this country on the occasion of the centennial celebration of the surrender of Yorktown.

THE Virginia Senate refused to pass the Riddleberger debt bill over the veto of the Governor—ayes, 19; noes, 16. Not the necessary two-thirds.

THE British Parliament was dissolved on Tuesday. In the House of Commons the Chancellor of the Exchequer said writs for the new elections will probably be issued on the 24th, the day after the House of Commons separates.

THE last number of the *Rocky Mountain Courier*, of Green River, Wy., gives an account of an active volcano near Brown's park. The crater is five feet in diameter, emitting sulphurous smoke, but there is no lava yet. The snow in the vicinity has been melted by the heat of the volcano.

IN the case of Clarke, elected Judge in Cincinnati, involving the constitutionality of the Federal election laws, the Court affirms the law is constitutional, and orders the prisoner remanded to the custody of the United States Marshal. Justice Field read a dissenting opinion in the case.

The Audiphone.

Inventive genius is becoming equal to all emergencies, and now it has come to pass that people are enabled to hear without ears.

Mr. Richard S. Rhodes, of Chicago, is the inventor of the "audiphone," an instrument that enables the deaf to hear through the medium of the teeth.

The audiphone resembles a fan, and is made

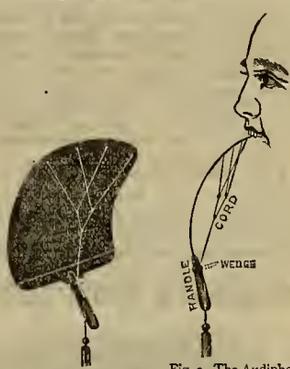

Fig. 2. The Audiphone in tension; the proper position for hearing.

Fig. 3. The Audiphone properly adjusted to the upper teeth; ready for use. (Side view.)

of carbonized rubber carefully polished, and by its flexibility it is sensitive to the slightest vibrations of sound waves, which, when in use, it gathers and conveys through the teeth and auditory nerve to the inner ear and the brain.

We witnessed this practical use of this remarkable instrument in the hands of a gentleman who is deharred from ordinary conversation without artificial aid, and no one would discover his deafness while he has the audiphone in position. It restores to the deaf the enjoyment of conversation, music and public entertainments—previously denied—and relieves the deaf ones friends of much annoyance in repetition and endeavors to made him hear what they say. Mr. H. E. Mathews, as agent for the sale of audiphones on this coast, will send the instrument free to any address on receipt of price, $10.

Address him at 606 Montgomery street, San Francisco, Cal., or call upon him and he will demonstrate the truth of the adags, that "Wonders never ceass."

Mining Location.

An important ruling upon the subject of mining locations has recently been given by Judge Bowen, of Colorado, in a Leadville case. The ruling touches upon the definition of the status of a discovery within the boundaries of a valid location. Judge Bowen says:

"A vein, ledge, lode or deposit of mineral-hearing rock in place being once discovered, and such having afterwards been followed up by a valid location and record of a lode-claim based upon such discovery, the land, earth or mineral within the limits of such location ceases to be unappropriated public domain of the United States, and thereafter no valid location of a mining claim can be made thereon, based upon a discovery of mineral-hearing rock in place lying within the lines of the claim so first located, save any except by the owner of the claim so first located, and a location so made by such owner would be an act of abandonment of at least so much of the first location as might be included within the lines of the second, and should such location include the discovery shaft of the first, then such location would be an act of abandonment of the whole of the first location."

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

[From Official Reports for the "Mining and Scientific Press," Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

FOR THE WEEK ENDING MARCH 2, 1880.

225,002.—HOSE-PIPE NOZZLE—F. L. Alderson and T. Loftus, Sacramento, Cal.

224,082.—WHIP AND REIN HOLDER—G. D. Anderson, Oakland, Cal.

225,001.—EXCAVATING MACHINE—J. T. Dongine, S. F.

225,161.—AIR COMPRESSOR—J. H. Parkinson, Virginia, Nevada

225,023.—ORE FEEDER—H. M. Ransom, Oakland, Cal.

225,194.—DREDGING MACHINE—Z. Williams, Oakland, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

REVOLVING FIRE-ARMS.—Alfred Swingle, No. 114 and 124 Spear street, S. F. Patented Feb. 17, 1880. No. 224,742. This invention relates to an improvement in fire-arms or guns of that class known as "revolving breech-loaders." All the movements necessary to charge and discharge the arm are positive, and none of them depend upon any spring except the hammer and trigger, which are actuated in a manner similar to those in other arms. The arm consists of very few simple and strong parts, which are easily dismounted or assembled. Each cartridge in the magazine, as it reaches a position in line with the barrel, is forced into the chamber of the barrel by a plunger which is caused to reciprocate in line with the barrel by mechanism. The plunger has two steel hooks attached to its front end, top and bottom to serve as an extractor, and when the plunger is drawn back it will be seen that the rotation of the magazine will carry the flange of each shell into a position between these hooks and the head of the plunger. When this plunger is forced forward it carries the cartridge into the chamber of the barrel, and when it is drawn back it brings the shell with it, so that it again lies in the magazine ready to be carried around to the point of discharge by the rotation of the magazine. The advantages claimed for this invention are as follows: It is strong and yet simple, capable of standing hard service with little liability of getting out of order. It can be loaded and fired with great facility, and for durability and penetration is equal to the best arm in use. The magazine being so constructed that the cartridges are side by side instead of being in line with each other, with the primer of one resting on the point of the preceding one, there is no danger of premature explosion. The machinery working with positive movements, there is no liability of its failing to perform service. It can be used as a single breech-loader or repeater. The principle can also be applied to pistols, shot-guns, rifles or machine guns.

PLEDGED MINING STOCKS.—Judge Daingerfield has rendered judgment on the pleadings in the case of W. D. Heaton vs. S. P. Warren *et al.*, an action to recover on promissory notes given for mining shares. The defense set up that plaintiff represented that he owned nearly all of certain stock, and that the same, under the agreement of sale, was to be retired from the market and placed in plaintiff's keeping for the use of defendants, to be surrendered upon payment of 50 cents per share, but that they were sold for expenses and an assessment. It was alleged that the representations were not true, and that plaintiff had many other shares, which were thrown on the market, thereby decreasing the value of defendants' shares. Judge Daingerfield did not consider these averments a defense. Another defense was that plaintiff held the stock as a pledge or mortgage, and that the security ought to have been exhausted before the action was brought. The court held that such property is not the subject of mortgage. But if it were, he did not think it would be the duty of the holders of mining stock, when holding under a pledge, to sell it, except upon the request of the pledger. He might do so and protect himself provided he obeyed the sections of the Code implicitly, but was not compelled to do so. He might foreclose a lien by selling the pledge and sue for the balance due, but was not compelled to do so. The answer showed that the stock had been sold for assessments. It was the duty of the owners to pay the assessments and keep the pledge intact. They failed to do so, and plaintiff was deprived of all security. There was no allegation of damage except in expectant profits, which profits were too remote to be recoverable by way of offset.

ABOUT 60 Chinese arrived in St. Louis Monday from San Francisco, and all but 10 or 12 of them passed through en route to New York and other Eastern cities, where they will seek employment in the shoe and cigar factories, laundries, etc. A general exodus of Chinese from the Pacific coast is threatened.

Metal Items.

From James Lewis & Son's Monthly Report on Ores and Metals, at Liverpool, Eng., January 31st:

Copper—Sales in January of ore 9,686 tons, from 13s 6d per unit early in the month to 15s 6d at its close. Sales of precipitate 2,026 tons, from 14s to 15s 6d per unit. Sales of regulus 3,525 tons, from 14s to 15s per unit. Quotations January 31st are: Good ordinary brands £73 to £73 10s, for arrivals £74 10s to £75 per ton. Regulus 15s 6d, and good ore 15s per unit. Imports 1879, 95,474 tons fine. Exports, 29,129 tons fine.

Lead—£19 to £19 10s per ton for ordinary shipping brands, showing an advance of £4 10s on the year. Spanish soft silver, £18 10s to £18 15s per ton.

Antimony—An advance of £21 per ton in the year. Ruling price £71 to £73 per ton for French Star regulus.

Tin—Straits and Australian advance £30 10s during the year, and £7 during the past month. The quotations to date are £98 to £98 5s, and £104 per ton for English.

PAGE introduced a hill in the House Monday to confirm the patents heretofore issued to the Western Pacific Railroad Company for certain lands within the boundaries of the rejected Moquelemas grant, which have been ruled out by the Interior Department.

M. ROUHER and wife have started for Chiselhurst to take leave of the ex-Empress Eugenie, previous to her departure for Zululand on the 26th. The Empress will stop at St. Helena on her return voyage.

OUR AGENTS.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. L. THARP—San Francisco.
R. W. CROWELL—California.
A. O. KNOX—Pacific Coast.
G. W. MCGREW.—Santa Clara county.
J. B. BACHELDER.—Shasta County, Cal.
JAMES ROGERS—Oregon and Washington Ter.
CAPT. W. H. SEAMENS—Arizona.
M. P. DWEN—Santa Cruz County.
H. E. HALLETT—Alameda County.
PERLEY P. KILBOURNE—Sacramento County.
M. B. STARR—Contra Costa county.
F. M. VARDEN—Alameda Co., Cal.
C. A. MCMAHON—Sutter and Yuba counties.
J. W. A. WRIGHT—Merced, Tulare, Kern and Fresno counties.
LORANE MINOR—Sacramento Co.
H. D. OLIVER—San Francisco and Alameda counties.
N. E. BOYD—San Bernardino Co.
J. M. HARTMAN—Solano and Sonoma counties.
S. M. PERRY—Los Angeles, Cal.
JARED C. HOAG—California.

In the Whole History of Medicine

No preparation has ever performed such marvelous cures, or maintained so wide a reputation, as AYRES' CHERRY PECTORAL, which is recoguized as the world's remedy for all diseases of the throat and lungs. Its long continued series of wonderful cures in all climates has made it universally known as a safe and reliable agent to employ. Against ordinary colds, which are the forerunners of more serious disorders, it acts speedily and surely, always relieving suffering, and often saving life. The protection it affords, by its timely use in the throat and chest disorders of children, makes it an invaluable remedy to be kept always on hand in every house. No person can afford to be without it, and those who have once used it never will. From their knowledge of its Composition and effects, physicians use the CHERRY PECTORAL extensively in their practice, and Clergymen recommend it. It is absolutely certain in its remedial effects, and will always cure where cures are possible.

FOR SALE BY ALL DEALERS.

PIEDMONT SPRINGS.—The exciting and stimulating properties of pure oxygen are well known, and everyone has felt the invigorating influence of fresh air. When the system becomes nervous, and the brain fatigued with the cares of business, just go into the open air, take a ride to Piedmont on a pleasant day, drink of the pure mineral waters, climb the Rigi for an inspiring view, and the effect will be instantly perceived; the blood will course with freshness; the lungs will work with increased activity; and the whole frame will feel revivified, and nature's stimulant will be found the cheapest and the best. The fare by street railroad from Oakland is ten cents.—*Work and Play.*

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct (or if the paper should ever come beyond the time desired), be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omissions of agents.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half-yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce, and valuable for future reference and library use.

FRESH attractions are constantly added to **Woodward's Gardens**, among which is Prof. Gruber's great educator, the Zoographicon. Each department increases daily, and the Pavilion performances are more popular than ever. All new novelties find a place at this wonderful resort. Prices remain as usual.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription, and request that they circulate the copy sent.

EXTRA COPIES can usually be had of each issue of this paper, if ordered early. Price, 10 cents, postpaid.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Atlanta Mining Company.—Location of

principal place of business, San Francisco, California. Location of works, West Tintic Mining District, Juab County, Utah.

Notice is hereby given that at a meeting of the Board of Directors, held on the Second day of January, 1880, an assessment (No. 1) of Five Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, room 7, No. 420 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Fifth (5th) day of February, 1880, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Friday, the Twenty-Seventh (27th) day of February, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

A. F. MCGREW, Secretary.

Office—Room 7, No. 420 Montgomery street, San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Thursday, February 26th, 1880, and the day of sale to Monday, the 22nd day of March, 1880. By order of the Board of Directors.

A. F. MCGREW, Secretary.

Office—Room 7, No. 420 Montgomery street, San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Wednesday, the 17th day of March, 1880, and the day of sale to Saturday, the 10th day of April, 1880. By order of the Board of Directors.

A. F. MCGREW, Secretary.

Office—room 7, No. 420 Montgomery St., San Francisco, California.

California and Oregon Land Company.—

Principal place of business, San Francisco, California. Location of works, Lake and other counties, Oregon.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 5th day of February, 1880, an assessment of Thirty cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin, to the Secretary.

Any stock upon which this assessment shall remain unpaid on the 15th day of March, 1880, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Thursday, the 15th day of April, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

R. N. VAN BRUNT, Secretary.

Office, 318 Pine street, room 6, San Francisco, California.

Cataract and Wide West Gravel Mining

Company.—Location of principal place of business, San Francisco, California. Location of works, Eho Mining District, Calaveras County, California.

And in accordance with law and an order of the Board of Directors made on the 2nd day of February, 1880, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the Company, No. 28½ Kearny street, San Francisco, California, on Monday, the 29th day of March, 1880, at the hour of 10 o'clock A. M. of said day, together with costs of advertising and expenses of sale.

WM. B. LAKE, Secretary.

Office, 28½ Kearny street, San Francisco, California.

Gover Mining and Milling Company.—

Location of principal place of business, San Francisco, California. Location of works, Amador County, near Drytown, California.

Notice is hereby given that at a meeting of the Directors held on the Eighth day of March, 1880, an assessment (No. 41) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, No. 402 Front street, room 8, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Twelfth day of April, 1880, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the Third day of May, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

W. O. WILSDN, Secretary.

Office—402 Front street, room 8, San Francisco, California.

GRIMSHAW on SAWS!

History, Development and Action; Classification and Comparison; Manufacture, Care and Use of SAWS of all kinds. Quarto, 224 Illustrations.

By ROBERT GRIMSHAW, Ph. D., M. E.,

Member of the Jury on Wood-working Machinery at Paris Exposition of 1878.

This thorough work, impartially written in a clear, simple and practical style, treats the Saw scientifically, analyzing its action and work, and describing, under the leading classes of Reciprocating and Continuous Acting Saws, the various kinds of large and small hand, sash, Mulay, jig, drag, circular, cylinder and band Saws, as now and formerly used for crosscutting, ripping, scroll-cutting, and all other sawing operations in wood, stone and metal, ice, ivory, etc., in this country and abroad. With appendices concerning the details of manufacture, setting, swaging, gumming, filing, etc., tables of gauges, log measurements from 10 to 24 feet, and from 12 to 96 inches, lists of all U. S. Patents on Saws from 1790 to 1880, and other valuable information. Elegantly printed on extra heavy paper, wide margin, copiously indexed.

Owing to an increase of nearly 100% in number of pages and illustrations since first projected, the price is this date made $2.50, postage paid

ROBERT GRIMSHAW,

624, 626 and 628 Market Street, Philadelphia.

SAN FRANCISCO, SATURDAY, MARCH 20, 1880.

VOLUME XL Number 12.

The White Rotary Pulverizer.

We present on this page a fine engraving of the White Rotary Pulverizer, the invention of George W. White, of this city. The mining community has been called upon to examine very many varieties of ore pulverizers, few of which have worked any length of time owing to various causes, principally to a lack of free discharge and to the beating, friction and wear consequent upon high speed. Mr. White claims to have overcome these faults in the newly devised machine; the first by the friction gear shown in the engraving, and the latter by the fact that the discharge is entirely open, and not through either wire screens or punched plates, the ore being very highly pulverized in its passage through the beater bars.

The bed plate of the pulverizer is cast in three pieces which are bolted together. The chairs for the friction rollers are planed on the bottom, and their seats on the bed plate are also planed. The machine is entirely open at the bottom of the cage, the center piece of the bed plate being cut out five inches wider than the cage which carries the beater bars.

There are five rows of beater bars, three rows running in one direction and two alternate rows running in the opposite direction. The rows of beater bars are 1¼ inch apart, the disintergrating being accomplished entirely by the attrition of the ore being accomplished entirely by the attrition of the pieces.

The ore for the pulverizer must first be passed through a rock breaker, to reduce it suitably for being fed by the screw feed. The cage consists of two distinct compartments, all but the outer row of beater bars being attached to concentric rings, which latter are in turn attached to their respective outer and inner shafts.

The beater bars are made of the best homogeneous steel. The shafts carrying the cage are also of steel and are hollow, the larger being nine inches in diameter, carrying the outer disks; the smaller one seven inches in diameter, carrying inner concentric rings. The metal is three-quarter inch in thickness, thus leaving a half inch space between the shafts, and a space five and a half inches in diameter through the inner shaft for the feed tube.

The feed screw, by a peculiar construction of the tube at the inner end, distributes the ore in equal quantity to each compartment of the cage. The inner shaft is adjusted so that it does not bear against the outer one; and both shafts are kept in their horizontal position by adjusting the friction pulleys by means of set screws at each bearing; the boxes for the gudgeons of the friction pulleys, all being free to move up and down, resting on the set screws.

The outer shaft is kept from moving horizontally by a set collar at each end screwed on to the inner shaft. The inner shaft is kept in place horizontally by means of two thrust bearings bolted into the end chairs, carrying layers of steel friction rings, against which the ends of the shaft run.

The friction pulleys for the inner shaft are 18 inches in diameter, and those for the outer shaft two inches less. Oil cups are set to each gudgeon bearing, and require filling once in 24 hours.

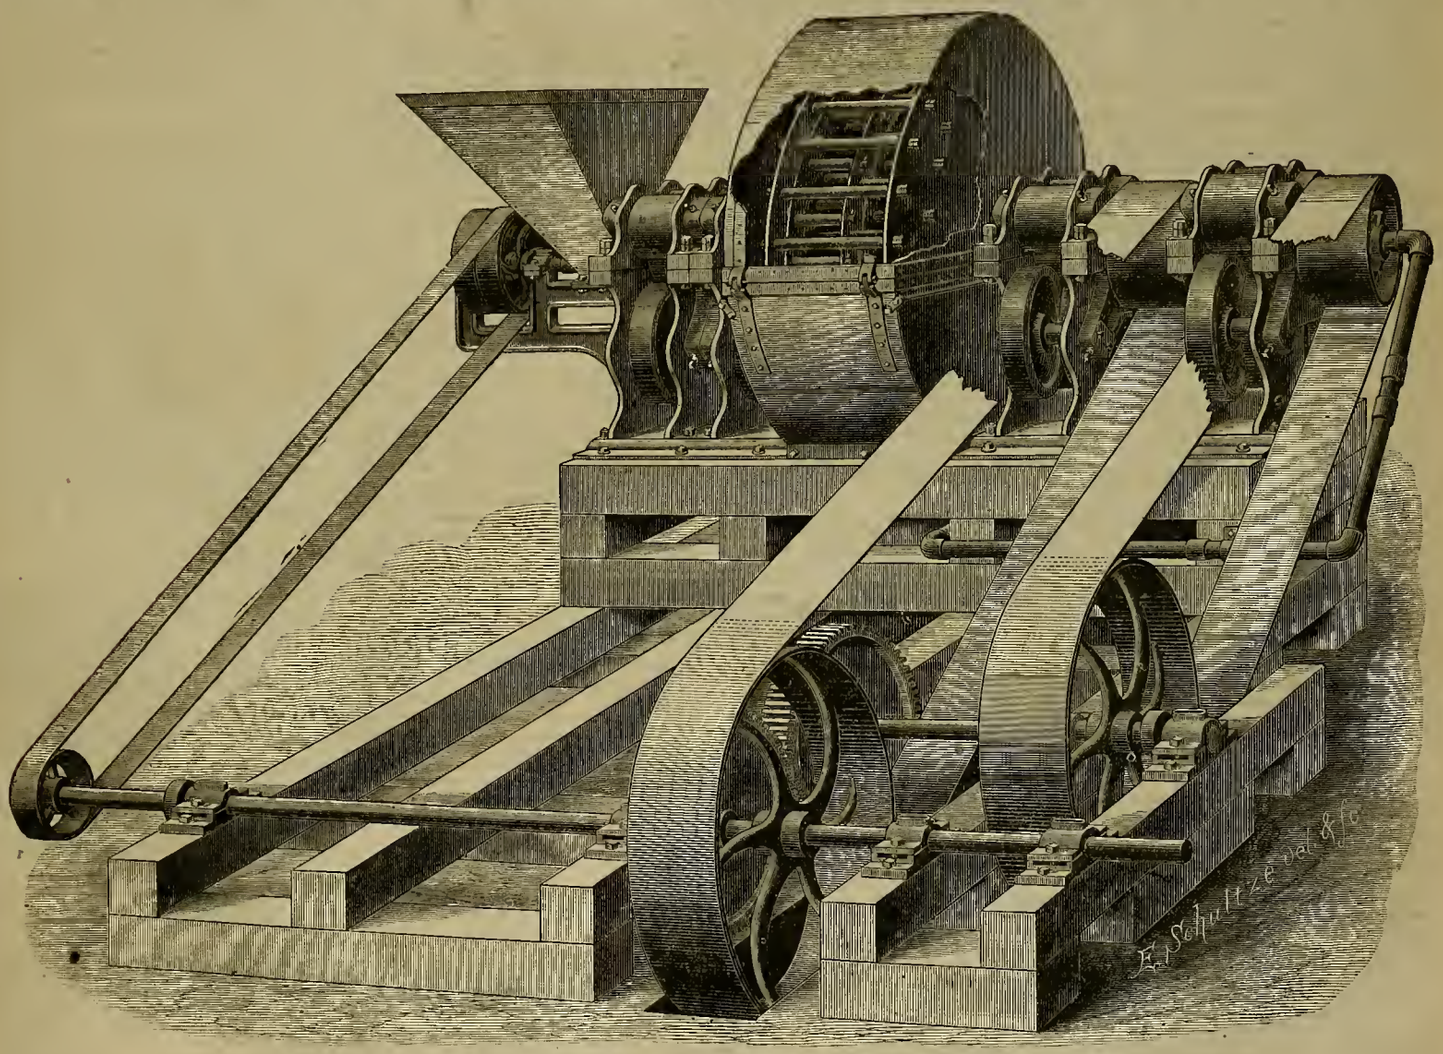
A revolving screen, 48 inches in diameter, is placed under the cage and is geared to the driving or line shaft. It is of sufficient capacity for 200 tons per 24 hours, through No. 40 screens.

We are told that no dust arises in the feed hopper, or escapes out of the machine, and that all the adjustments can be made while it is in motion. The pulleys carrying the end of the outer shaft, next to the hopper, are not shown in the engraving. The pipe shown is to relieve any extra pressure of air in the screen chamber below.

The constant pulverizing power of this machine is absolute from the moment the ore begins feeding to the beater bars. There is no loss of time and power as in lifting stamps.

Mr. White has already built one of these pulverizers, 56 inches in diameter. After trying this No. 1 machine to his satisfaction, in this city, he contracted to put it at work for the Alexander mining company at Grantsville, Nev., guaranteeing its success. Mr. Jno. L. Bray was Mr. White's agent, and erected the machine at the works, turning it over to the company complete in the latter part of January, since which time it has been in daily use, and Mr. White tells us, doing more than was guaranteed, exceeding even his expectations.

This 56-inch, No. 1, pulverizer can readily be built in sections so small as to be easily packed on animals. The pulp delivered is of uniform size, very suitable for concentration, roasting or lixiviation. A patent has been allowed for this apparatus. It is manufactured at the Ætna Iron Works, 217 Fremont St., in this city. Prices will be seen by referring to card in another column.



GEO. W. WHITE'S IMPROVED ROTARY ORE PULVERIZER.

LARGE MINING SALE.—The statement is made that the Shiefflin Bros., have sold their interest in the Tombstone mill and mines for $2,000,000 to Corbin Bros., and the Disston party, of Philadelphia, and Messrs. Simmons and Squire of Boston. The price looks pretty steep.

IT IS understood that the Central Pacific Railroad Company is considering the propriety of laying off ground at Sacramento for cattle yards.

THE Hirschman gravel claims in Nevada county are reported sold to New York gentlemen for $95,000.

THE Oneida mill, in Amador county, is now running 40 stamps, and the Zeile mill 20 stamps.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS

Mayflower Gravel Mine.

EDITORS PRESS:—Among the mines of this district is the Mayflower gravel mine, which covers 450 acres of mining ground, and has two ontlets, one in the Yonng American canyon, the nther in the Second Brnshy canyon—hoth canyons trihutaries of the Shirt Tail canyon. It has pnt in the Young American canyon 6,200 feet of flume, 40 inches wide and 24 inches high, lined with blocks, 8 inches in thickness, the whole lcngth of the flume. It has heen prospecting their property since the 1st day of November, 1877, with the most encouraging results, and if it was not for an injunction put on their works over 11 months ago, the owners would have already received handsome dividends, and a large number of men would find employment.

It has found the continuation of the Paragon lead, owned by Messrs. Breese and Wheller. Tbis famous lead is an upper lead 150 feet above hedrock. Tbe gravel has been followed and mined for a distance of over 4,000 feet in the hill, in a northwesterly direction. The Mayflower claim is the adjoining claim of the Paragon on the northwest; the easterly line of the Mayflower is running about 2,000 feet with the northwesterly line of the Paragon.

The Mayflower intends to take tbe water for hydraulicing purpose from Messrs. Breese and Wbeller's ditch, the Miners' ditch, which passes on this side of the divide, heing the property of the Dardanelles company, who need all the water they can obtain from their ditch to wash away a very thick bank of hard cement covering their gravel. Other mines in the Second Brnshy, Messrs. Alhrect and Brown among them, intend also to take water from Messrs. Breese and Wheller.

Lately the Mayflower company have began to open the mine in the second outlet, the Seeond Brushy canyon, and they are now preparing the ground to hydraulic some very good surface diggings found there. The company is also rnnning a prospecting tunnel for drifting purpose; some very good gravel has been already found on the bedrock. The tunnel will he run to tbe main channel of this divide, wbich is known to pass on the Mayflower ground.

F. C.

Forest Hill, Cal., Mar. 1, 1880.

Prof. Blake's Address Before the Bullion Club.

Prnf. W. P. Blake addressed the Bullion Club, New York city, on the subject of his recent trip among the Western mines, and helow we give the substance of his remarks:

He spoke of the great quantity of snow which covered the great ranges of .mountains, on some of whicb it was deeper than ever before known. This winter, he said, has been unexceptionally severe on the ranges. The great fall of snow, however, promises an unusual harvest of gold next seasou, for it is with the water coming from this snow that the placer miner secures the gold.

In describing bis trip from Salt Lake City be said that he first came to the Bingham Canyon deposits, which have excited more than usual attention and interest during the past summer. They are great ferruginous outcrops, carrying deposits of argentiferous lead and bodies of carbonate lead, also great masses of iron pyrites. The miners paid little regard to these deposits until last season, when they found that the larger portions of the outcrop paid for working in the ordinary way. The absence of a bountiful supply of water bas, however, been disadvantageous, and it is proposed to transport tbese ores to Jordan river to have them refined.

In the district in which tbe noted Ontario mine is located, mining has been carried on very successfully during the past year. In the Ontario mine a depth of 600 feet has heen reached, and the vein looks as well below as above. One prominent feature in regard to the increasing value of this property is its consolidation with the Last Chance mine, which adjoins it. This consolidation will greatly strengthen the Ontario in regard to the producing of ore, as explorations in the Last Chance have shown great richness. The lodes extending beyond these mines seem to contain mineral for several miles.

In southern Utah there are many interesting properties. The great Silver Reef region is of particular interest to miners from the fact that it is a vast mass of ore in modern sandstone, in which very few miners would ever look for valuable deposits of silver ore. The completion of the Utah Southern railroad has opsned up many interestiug districts which have heretofore been inaccessible. The town of Butte is a particularly interesting mining center for Montana, as some of her best developed mines are located there. The principal mine of that region is the Alice, which is now down to a depth of 500 feet. The vein is from 40 to 80 feet in width, and passes through different bodies of ore which might be called low grade.

In Nevada there are the important minea of Eureka and Comstock. The hot water of the latter, he tbougbt, was local, and if it [abould be caugbt and carrisd off, tbe heat would be mucb lessensd. To secure the future success of the Comstock, thsre should bs consolidation and unity of intsrest, and a deep shaft should he started far east to intercspt the vein at a considerahle dspth.

Bodie, which belongs to the interior system of mineral deposits, is one of the most interesting mineral deposits of which there is any knowledge. In California, the gold mines, wherever worked with skill and energy, are doing remarkably well. Just now there is a period of depression in that State. The Empire is now paying dividends. It is an enormous vein and a promising mine.

Plumas county, one of the best gold-producing counties in the State, contains the Green Mountain, Cherokee, Gold Stripe, Plumas, National, Crescent aud others. The Crescent has been worked with great profit for a long time, and has declared $300,000 in dividends. The Green Mountain mine has the advantage of being upon a mountain, and can be worked by tunnels rather than by shafts. This location is snch that the ores can be excavated and trammed out to the mill at a smaller expense than probably any other mine at the present time. The ore from this mine yields from $7 to $10 per ton, which leaves a very large profit. Tbe vein is very large, and has some peculiar characteristics which mark it as allied to deposits of hot water.

The Indiana Valley has a great history, but is lying idle and awaiting enterprise and capital to reopen it. The Gold Stripe is now being worked successfully, and promises well for the future. All the mines in this group in the vicinity of the Indian Valley are well supplied with timber and water, and everything necessary for successful mining operations, and it is hoped will add largely to the bullion production of California.

In Arizona great interest is manifested in mining. This will he one of the greatest mineral producing territories, and it will be especially interesting because it is soon to he opened throughout by the Southern Pacific railway. The climate in that country is never so severe as to interfere with mining operations, and railroads are soon to he built, making the mining regions accessible from the east and west. The San Juan region is in southern Colorado, and contains some of the highest mountains in the Rocky mountain system. There are mountains with silver-hearing veins from the summit to the base, and this district is destined to be one of the most important mining centers of the American continent. Water and timber are abundant, and on the western slope the climate is remarkable; the soil is fertile in many places, and there are vasts beds of coal nearly equal to those nf the great coal fields. Further to the north and east of this region is Leadville, which is the most remarkable mineral locality in the known world. In conclusion, he said: "Taking the immense amount of bullion produced from the mines in our country, we can say tbat mining has become a great industry, and each one of us should put his shoulder to the wheel and endeavor to push it ahead."—*Economist.*

Patents for Mineral Lands.

The United States mining laws provide that a patent for any land claimed and located for valuable deposits may be obtained in the manner prescribed by Section 2325 of tbe Revised Statutes, which is as follows:

Any person, association, or corporation authorized to locate a claim under this chapter, having claimed and located a piece of land for such purposes, who has, or have, complied with the terms of this chapter, may file in the proper land office an application for a patent, under oath, showing such compliance, together with a plat and field notes of the claim or claims in common, made by or under the direction of the United States Surveyor-General, showing accurately the boundaries of the claim or claims, which shall be distinctly marked by monuments on the ground, and shall post a copy of such plat, together with a notice of such application for a pateut, in a conspicuous place on tho land embraced in such plat, previous to the filing of the application for a patcnt, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in such land office, and shall thereupon be entitled to a patent for tbe land, in the manner following: The register of the land office, upon the filing of such application, plat, field notes, notices and affidavits, shall publish a notice that such application has been made, for the period of sixty days, in a newspaper to he by him designated as publisbed nearest to snch claim; and he shall also post snch notice in his office for the same period. The claimant at the time of filing this application, or at any time thereafter, within the 60 days of publication, shall file with the register a certificate of the United States Surveyor-General that $500 worth of labor has been expended, or improvements made upon the claim hy himself or grantors; that the plat is correct, with such further description by such reference to natural objects or permanent monuments as shall identify the claim, and furnish an accurate description, to be incorporated iu the patent. At the expiration of the 60 days of publication the claimant ahall file his affidavit, showing that the plat and notice have been posted in a conspicuous place on the claim during auch period of publication. If no adverse claim shall have been filed with the register and the receiver of the proper land office at the expiration of the 60 days of publication, it shall be assumed that ths applicant is entitled to a patent, upon the payment to the proper officer of $5 psr acrs, and that no adverse claim sxists; and thereafter no objection from third parties to ths issuance of a patsnt shall he heard, except it be shown that the applicant has failed to comply with the terms of this chapter.

Since this section of the law was framed, some little difficulty was found in uon-residents patenting their land, their presence on the spot heing necessary. An amendmeut to the section has been recently made, which is added to the section, as follows:

Be it enacted hy the Senate and House of Rspresentatives of the United States of America in Congress assembled, That Section 2325 of the Revised Statutes of the United States he amended by adding thereto the following words: "*Provided*, That where the claimant for a patent is not a resident of the land district wherein the vein, lode, ledge or deposit sought to he patented is located, the affidavits required to be made in this section by the claimant for such patent may be made hy his, her or its authorized agent, where said agent is conversant with the facts sought to be established by said affidavits: *And provided*, That this section shall apply to all applications now pending for patents to mineral lands."

This will relieve non-residents of the burden of going to the ground to make affidavits which can just as well he made by agents who are conversant with the facts.

Homestead Settler's Bill.

Tbe hill passed by the United States Senate lately for the relief of bomestead settlers is a measure of great importance. It was originally introduced by Senator Booth, and his persistent efforts procured its passage both in the Public Land Committee and in the Senate. Under the existing law the right of pre-emption on puhlic land attaches from the date of settlement, but the right of a settler under the homestead law only from the date of entry. This bill provides that the land shall he giveu to the first settler, whether he claims as a pre-emptor or as a homesteader. Senator Booth said on this point: "There is no reason why the right of a homestead settler should not relate back hy his alleging the date of his settlement in his homestead affidavit, and the fact that a settler now before a survey, has no option, but must claim under the pre-emption law in order to cut intervening settlers nr grants, is sufficient reason why it should relate hack, for mauy settlers have already used their pre-emption right, and are now, although in possession of valuable improvements, entirely at the mercy of 'intervening pre-emptors, or railroad grants.'" The hill next provides that tho first settler upon an ahandoned homestead entry shall have a preference right to acquire title to it after the original entry is cancelled, and the last section substitutes for the present roundahout and dilatory method of cancelling relinquished homesteads and timber culture entries in the General Land Office, the common sense provisiou that such relinquishments shall be effectual as soon as they are filed in the local land office. Senator Booth, in explaining this section said: "These relinquishments are nearly always made as the result of the purchase of the improvements by some person who is looking for a homestead, and if the cancellation were immediately noted, he, by reason of his being a party in the matter, would be able to enter before anyone else; but as lbng as cancellations in such cases are made as at present, he has no advantage hy reason of such purchase, for in the interval it hecomes widely known in the neighborhood of the Land Office that the claim to that tract has been relinquished, and all the jumpers and speculators of both localities are immediately on the alert to ascertain iu advance of every one else the moment of the cancellation." This desire is no small source of corruption in the local land offices, and the reporting of cancellation, hy telegraph which goes hy mail, forms a considerable part of the husiness of some land attorneys.

A VALUABLE MAP.—There has just heen completed at the State Engineer's office that which is probably the largest map in the State. It is 26 feet in length, and covers a large portion of the walls of one of the main offices. It embraces the Sacramento and San Joaquin valleys from Iron canyon, beyond Red Bluff, to the foot of Tulare lake, and between the Sierra and Coast range foothills, and is intended to be a complete topographical and hydrographic chart of that section of the State. It shows the course of every mining ditch, reservoir, irrigating ditch, etc., and also all the larger and more important farms, in many cases even the locality of the houses. The tract of country wbich is now subject to flooding by mining debris is clearly depicted, so that any person can tell at a glance what proportion of the valley has been injured in this way. The Yolo, Sutter and Colusa basins are outlined, with figures showing the amount of water contained in each at certain stages of floods, etc. There is, in fact, nothing of a topographical or hydrographic nature concerning the section alluded to which this map does not show, and so clearly and on so large a scale that anybody of ordinary intelligence can understand it readily. It waa compiled from surveya made and data procured by the engineers of the department under charge of Mr. Hall, and speaka well for their efficiency and the enterprise of the State Engineer himself.—*Sacramento Bee.*

Public Lands Commission Report.

The forthcoming report of ths Public Lands Commission will recommend that swamp and pasturage lands hereafter be surveyed and patented by townships; that better provisions hs made for making boundaries of surveyed tracts; that the system of letting public surveys and boundaries between States and Territories bs hereafter made under the direction of the Coast and Geodetic Survey. It will also, probably, recommend that the office of Receiver at each local land office be abolished. There are about 95 of these officers. It will also recommend the classing of public lands into five general classes —arable, irrigable, pasturage, timber and mineral. It will also recommend the repeal of the pre-emption law, on the ground that its chief use now is to increase large individual holdings. The commission will probably supplement it by another, making arable puhlio lands disposable under the Homestead laws. The commission will probably recommend no limit hs placed upon amounts of irrigable land which any one person may huy; that the land be sold at 25 cents per acre, nne-fifth to be paid down and the balance at the end of three years, and that no patent to such lands he issued until it is shown that a specified sum per acre, say $2, has been expended on its reclamation. Lands classed as pasturage, will comprise untimbered and new mineral lands, not arable or capahle of irrigation.

The commission will probably recommend that the quantity one person may huy be not limited, and that the price he graduated as follows: All lands sold prior to January, 1886, hs at the rate of $1.25 per acre, and all lands sold from the latter date to January, 1890, to be at the rate of $1 an acre. After the last named date all lands remaining he sold at 75 cents an acre, with a reduction of 12½ cents per acre every three years until the minimum price of 12½ cents is reached. Pasturage lands shall he opened to homestead settlement, no one entry to comprise more than 2,560 acres. It will probably recommend that colonies of 20 or more families may enter homesteads either on arahle, irrigahle or pasturage lands, and lay out a village in the center of the tract.

Radical changes will be recommended in the mineral land laws, among them the following: That the time during which a prospector or discoverer shall he able to hold his claim hy possessory title shall be fixed and limited hy law; that all local organizations and regulations respecting mining titles shall be aholished and the sole jurisdiction of all questions relating thereto be reserved hy the United States; that the "lode location," which permits the discoverer to follow a lode any distance, in any direction, whether within the boundaries of his surface location or not, be repealed; that hereafter every mining claim shall comprise a certain numher of feet, breadth and length on the surface, and that suhterranean property rights shall not extend heyond the surface boundaries thus fixed. It is quite probahle that the commission may refrain for the present from making any recommendation as to the area which each location may comprise. It also recommends that a system nf official survey and mineral inspection he adopted to prevent hlackmail and rohbery, and to obviate the necessity of legal contests before claims are patented.

The Mines of Utah.

Delegate Cannon recently made the assertion in the House that more money had been put into the mines of Utah than had heen taken out. In the face of all the difficulties that have elapsed during a period of ten years in the general stagnation and depression in business, supplemented hy local embarrassments growing out of sensational rumors affecting the security of person and property, and hy a well-founded fear of hostile legislation on the part of the dominant religio-political party of the Territory, the mining interest has struggled on to the front, and Utah now stands fourth on the list of mineral States and Territories in the Union. Within the short period of ten years this great interest has leaped from helpless infancy to lusty manhood. Its aggregated production amounts to nearly $47,000,000, with an annual yield of $4,700,000, or nearly 10% on an investment of $50,000,000. We place the actual value of the mines, prospects, mills, smelters, sampling works, machinery, tramways etc., in Utah, at double the supposed actual investment, or $100,000,000, and capital invested here during these ten exceptional years has doubled in value hesides paying nearly 10% per annum nn its original investment. We believe the facts would show a much larger return. These are the direct results; it is more difficult to sum up the indirect but equally substantial benefits accruing to all classes and to the Territory at large through the development of our mines. In a material sense our mining industry furnishes life-blood to the hody politic. Within the period referred to, it has lifted Utah from poverty and isolation to wealth and influence; has helped to build and largely sustain her railroads, furnishing four-fifths of her income; has erected churches, established schools, hospitals and charitable institutions; has infused into an enterprising people elements of activity and progress, and added to the population a class of people that any community would he proud of. Close up the mines, silence the clangor of stamps, put out the firea of smelters, and Utah would revert to obscurity and insignificance.—*Exchange.*

MECHANICAL PROGRESS.

Boiler Bracing.

The Engineer-in Chief of the United States Navy, in a recent report ou experimants in boiler bracing, gives the results of some interesting trials on the strength of screw stay bolts. The averags strain in pounds required to pull the 1-inch or 1¼-inch iron bolts through the ½-inch iron plate, was as follows:

WITH SUPPORTS 4 INCHES FROM CENTER TO CENTER.

1-inch bolt, not riveted	21,970
1-inch bolt, ordinary low conical head, three threads left through for riveting	25,147
1-inch bolt, button head; length of belt left through for riveting equal to 7-16 diameter of bolt.	33,791
1¼-inch bolt, button head; length left through for riveting equal to one-half diameter of bolt	38,885

WITH SUPPORTS 5 INCHES FROM CENTER TO CENTER.

1-inch bolt, ordinary low conical head	22,137
1-inch bolt, button head; length left through for riveting equal to 7-16 diameter of bolt	31,282
1¼-inch bolt, button head; length left through for riveting equal to one-half diameter of bolt	35,812

The cause of the inferiority of the ordinary low conical head bolts is explained in the following way: It was observed that the bulging of the plates caused the lap of the rivet-head on the plate to commence giving way or break off some time before the maximum strain was reached, thus leaving more for the threads of the bolts to sustain. As the strain and bulge of the plates increased, the plate around the bolt turned downward and outward, until the threads in the plats almost entirely cleared those in the bolts, so that in almost every case there were only from one to two threads stripped or injured on the bolt when it drew ont; therefore, it was deemed advisable to form the head in a different manner, and after several experiments it was decided that the rivet-head should be made as follows: First, by having as much of the bolt through the plats as could be riveted over without injury to the iron, which was, in cass of the superior iron being used, equal in length to about one-half the diameter of the bolt.

ANTI-FRICTION CAR-AXLE BOXING.—A new style of car-axle boxing is now being introduced at the East which is described as follows: Two friction wheels are employed in the box, running in line, each having a seven-inch face and giving a leverage between their periphery and axle of 75% to overcome friction, one of them, 10½ inches in diameter, placed nearly over the axle, say at angle to a vertical line of the axle of about 15°; the other, six and one-half inches in diameter, is placed down on the side of the axle and operates as a shoulder wheel. By placing the wheels in this position the oblique action is largely done away with, sufficient oiliness being retained to hold the axle in its proper place, and not allow it to come into frictional contact with the casing. The friction wheels have steel axles journaled in brass boxing. In the casing under each of these journals is an oil reservoir for lubricating the journals through waste, oil being supplied through channels extending out to edge of housing. These channels have covers to keep out dust, grit, etc. A number of advantages are claimed by the inventor over the old style of boxing: 1. That it is the lightest running known, 50% easier than the present system. 2. An important saving in lubricant, as it runs over 1,000 miles with one oiling. 3. That heating is practically impossible. 4. Greater durability than the present system, as the friction wheels having a very broad head will not cut or make indentations. This boxing is the invention of Mr. Levi H. Montross, of Seneca, Ontario county, N. Y.

A LOCOMOTIVE ELECTRIC LIGHT.—A locomotive electric light has recently been introduced in England for railway use which is said to operate satisfactorily. It consists of a light six horse-power four-wheel locomotive, with a dynamo-electric machine attached, and any electric light may be used. When the engine is moving along the line, the electric machine rotates at its proper speed, and when it is necessary to stop in order that the light may be directed on some particular spot, the driving wheels are thrown out of gear by means of the disengaging handle attached to the pinion on the crank shaft, and the machine ceases to be a locomotive, while the engine continues to move the dynamo-machine at its proper velocity. The engine is furnished with sensitive governors, so that the speed of the dynamo-machine may be accurately regulated, this being very important in order to insure a bright and continuous light.

A CHANCE FOR INVENTORS.—There has been less inventive genius displayed in the production of machinery in the pottery business than in any other branch of manufacture under the sun. The creation of pottery is almost entirely dependent upon the manual skill of the operative potter, and the only improvement that has been made in 4,000 years is in the substitution of steam power for the hand and foot in revolving the "jigger" and throwing wheel.

TOOLS IN GLASS WORKS.—The iron tools in glass works are affirmed to be much improved by being nickel plated. They are not only better protected against rusting, but the glass does not adhere as strongly to their surfaces as to plain iron. The claim is also made that pressed work made in nickel-plated molds is sharper and smoother than in common molds.

PETROLEUM AS A FUEL FOR THE BLAST FURNACE.—Some very interesting experiments have recently been made at the Fannie furnace of the Wheeler Iron Company, West Middlesex, Mercer county, Pa., the object of which was to test a device for utilizing petroleum as fuel in blast furnaces, the first experiment of the kind made. The crude petroleum is injected into the furnace in connection with hot blast and superheated steam. The chief obstacle in the way was the difficulty of injecting the fluid petroleum into the furnace against the pressure of the blast, but this difficulty has been overcome by a very ingenious arrangement, by which the pressure of the atmosphere is made to do service. The quantity of oil consumed is said to be small in proportion to the results produced, while the steam is heated by waste gas from the top of the furnace. The experiments have not thus far proved satisfactory in all details—a black cinder being produced, while the quantity of pig has fallen off. This is attributed to the fact that the arrangements for superheating the steam are insufficient. It is not in the item of cost that the chief advantage of the process is said to lie. The inventor claims that a large quantity of the sulphur, phosphorus and other impurities in the ore are eliminated in the furnace by the use of petroleum, and that as a superior quality of iron is secured, the gain in the quality will more than compensate for the increased cost of manufacture. It is thought also that the capacity of a furnace may be increased by using the process. Further experiments will be necessary in order to settle definitely what the invention will do, but the trial thus far is stated to have resulted in a run of metal of a superior quality.

ARCHITECTS VS. UNDERWRITERS.—In a late address by Mr. Edward Atkinson, in Boston, before the Society of Arts, on "The Relation of the Architect to the Underwriter," he remarked upon the few buildings which had any adequate protection from fire; he had examined many buildings in which the motive of the architect seemed to have been to protect fire from water. He objected to iron shutters, they warped as soon as the flames struck them; wooden ones covered with tin are much more serviceable. The modern factory should have no place in it where a rat can hide its nest, or where fire cannot be reached by water. The whole construction should be open; the spaces between the beams wide, not narrow, so that water can be sent in great streams crosswise or lengthwise. The roof should be nearly flat, so as to give a standing-place upon it for the fireman; never allow furrings or plaster on the walls; never permit in a factory that the timbers be connected with the walls, so that when the beam burns off or is torn off it brings the wall down. The beams should be laid on an iron plate, with their top corners arched off, and the bricks immediately above them laid dry, so that if anything happens these beams will roll out of their places and will not tear the wall down. But the great secret is cleanliness and order, and the means of putting out small fires. As a result of these practical precautions, Mr. Atkinson said that mutual insurance association of mill owners have made cotton factories, woolen factories and paper mills better risks than stone churches, brick schoolhouses and iron warehouses, and, perhaps, better than hospitals.

STEPHEN ROPER gives the following rule for finding the safe working pressure of steam boilers: Multiply the thickness of the iron .56, if single riveted, and .70, if double riveted; multiply this product by 10,000 (safe load); then divide the last product by the external radius (less thickness of iron); the quotient will be the safe working pressure in pounds, per square inch. Example:

Diameter of boiler, 42 inches.
Thickness of iron, ¼ of an inch.
2÷42
21 external radius.
.375
20.625 internal radius.
Thickness of iron, ¼=.375
.56 single riveted.
.21000
10000 safe load.
20 625÷2100.00000
101.81 lbs. safe working pressure.

A BIG DIAMOND DRILL.—A machinist of this city, says the Virginia City (Nev.) *Enterprise*, is engaged in figuring out a diamond drill which will cut a tunnel of ordinary size. Its main feature is a rim of saw blade steel six feet in diameter and three and one-half feet in width, with diamonds set in one edge. When a cut a yard in depth has been made the drill is run back and the block of rock knocked out. The machine is really a kind of circular saw. There is a sort of center bit, also armed with diamonds, that goes a little in advance of the main saw, and makes a hole an inch and a half in diameter. This assists in giving a steadiness to the main tool, and leaves a hole in which to insert a giant powder cartridge and knock out the block of rock when a cut has been made to the proper depth. This novel drill is intended for use in hard rock only, though it may be used in soft rock were the ground is not too wet and heavy.

SCIENTIFIC PROGRESS.

Popular Confidence in Scientific Discovery.

The popular mind in its attitude towards scientific progress and discovery has undergone a wonderful change in the last five or ten years. The great facts in science brought to view by the labors of investigators, so long as they had no special practical bearing upon the affairs of every-day life, were regarded with little interest, and made no deep impression upon the mind or belief of the general reader. Statements were made in the newspapers regarding this and that new fact brought to light in some department of science or art, but the news was seldom thought of or talked about in the homes of the people in the country or city.

Important and wonderful discoveries, like the spectrum analysis of new chemical elements, or new asteroids, have interested men within the circle of those engaged in research, but outside few have taken the trouble even to inquire as to the importance or significance of the new acquisitions to human knowledge. A class of discoveries, however, which seemed to involve religious beliefs or theological dogmas quickly attracted popular attention, and brought about a fierce war of words. Mr. Darwin, when he published the results of his studies and discoveries upon the origin of species became at once a marked man and an object of popular attack. He might have been the discoverer of 50 new stars, and his name would hardly have been known beyond the circle of his associates and scientific investigators generally. His views, now almost universally admitted and adopted in the world of science, continue to be derided and combatted by theologians and laymen, and in some instances with considerable sharpness and ability. The popular confidence, so far as it is influenced by such writers, does not rest with Mr. Darwin. The stupendous problems involved in astronomical science, and upon which it rests, puzzle and bewilder the popular mind, and but a kind of half assent is given to them. When the astronomer states in a public assembly that the sun is distant 92,000,000 miles, a majority are tempted to inquire, "How do you know that?" or when he states, further, that the orb is envisaged in a vast covering of incandescent hydrogen and other forms of matter, the unspoken reply is, "It may be so." We hesitate not to say that if astronomers and mathematicians had not been able to foretell eclipses, occultations of stars, approach of comets, etc., the great facts and principles of astronomy would have occupied in the popular mind a place scarcely higher than the astrology of the ancients.

This former state of indifference and doubt has now been broken, and the pendulum swings far the other way. The popular mind is ready to believe devoutly almost anything which men of research offer for consideration. The impossible, which once was observed in every direction, now has faded from view, and science seems to work miracles as did the apostles of old. The full establishment of the telegraph in all parts of the world immensely increased the popular respect for science; but when to this are added the telephone, microphone, audiphone, phonograph, electric lighting and the numerous other recent triumphs of science and art, the possibilities of scientific accomplishment have no longer a limit. There is a danger that this extreme development of faith may lead uninformed persons into errors through misapprehension, or extravagant claims of inventors and experimenters. Owners of gas stocks and other kinds of property supposed to be influenced by new discoveries should be cautious about sacrificing their securities in consequence of what is published in the newspapers. There are still many fallacies in the world claimed to be the outgrowths of science, and a wise discrimination and reserve should be maintained in all actions based upon what is claimed as new in science and art.—*Boston Journal of Chemistry.*

Important Invention Locating Sound.

Prof. Morton, of the Stevens Institute of Technology, in his report to the Lighthouse Board, describes a new instrument called a "topophone," by which the exact direction of sounds given by fog horns or fog bells may be promptly determined. The apparatus with which experiments were made consisted of the following parts: A vertical rod passing through the roof of the deck cabin, on the upper end of which was attached a horizontal bar carrying two adjustable resonators. Below these was a pointer, set at right-angles with the above bar. Rubber tubes passed through the roof of the cabin, and connected with a pair of ear tubes. A handle attached to the vertical rod served to turn it in any direction. Provided with the apparatus above described, on board of the light-house tender, *Mistletoe*, Profs. Morton and Mayer and Mr. French proceeded, on the 10th of September last, to Sandy Hook. There they landed and caused the fog horn to be put in action, and turned to a fixed note for convenience of adjustment, and then proceeded in the *Mistletoe* to various distances from the shore, and made numerous experiments to determine how closely a person seated in the cabin could turn the apparatus so as to indicate the true direction of the sound. It was thus shown that anyone, by simply turning until the least sound was perceived, would bring the pointer to within 10 degrees, or less than one point, of the true direction. This accuracy was, of course, all that was requisite in the practical use of the apparatus. On the following day they again went in the *Mistletoe* to Eaton's Neck, on Long Island, where they repeated the same experiments with like results, finding that at distances of from four to six miles it was easy to determine the direction of the horn from the vessel to within one point. In the course of these experiments, certain improvements in detail suggested themselves, and those have been embodied in a new apparatus constructed by Mr. French, with which Prof. Mayer has been making further experiments, with a view of perfecting all the details.

DANGERS FROM THE ELECTRIC LIGHT.—It appears that the electric light is not without its dangers. Some time ago a red-hot morsel of carbon dropped from one of the lamps at the British museum to a table usually occupied by readers. Measures were at once taken to prevent the recurrence of such an accident, but not with complete success, for a few days later a similar piece of red-hot carbon fell from the center lamp to the table of the superintendent of the reading room, upon a piece of loose paper, which began to kindle into flame. This, however, was speedily extinguished. It is conceivable that a single spark might do irretrievable damage to some unique manuscript or other priceless example of literary production. Large transparent glass or talc saucers have been suspended below each lamp, so as to intercept any stray piece of carbon which may happen to fall in the future. It is even proposed to try the experiment of lighting the room from outside, in which case the glass of the central part of the dome would offer a most effectual protection.

SYNTHESIS OF MILK-SUGAR AND CANE SUGAR. On this matter E. Demole says: Setting out with the idea that the glucose molecule of cane and of milk-sugar are different, the author endeavored to take a further step in the synthesis of these sugars by combining, on the one hand, levulose with dextro-glucose, and on the other galactose with lacto-glucose. In the second case he has succeeded. Milk-sugar was first resolved into two isomeric bodies, galactose and lacto-glucose, by the action of dilute acids. The product of this reaction, after removal of the acid, was evaporated and carefully dried, and was found to possess all the properties of a mixture of equal mols. galactose and lacto-glucose. It was treated with three parts of acetic anhydride in an apparatus provided with a cohobator, and heated to the boiling point until totally dissolved. On subsequent treatment, a body was obtained possessing all the properties of octacetyl-lactose.

ACTION OF POTASSIUM PERMANGANATE UPON POTASSIUM CYANIDE.—If standard solutions of these, says E. Baudrimont, are allowed to react upon each other it will be found that the decoloration of the permanganate has a necessary limit; this decoloration is facilitated by an elevation of temperature and the concentration of liquids; its limit is attained when two equivs. KCy are in contact with five equivs. of permanganate. The action is less rapid when the liquids are acidified with sulphuric acid. The products formed by the mutual reaction of the salts differ in their proportions if not in their nature. Those whose presence has been ascertained are urea, the carbonic, nitrous, nitric, oxalic and formic acids, and ammonia, due to the decomposition of the urea. The quantity of urea increases the more the mixture is acidified with sulphuric acid.

CHLORINE IN PLANTS.—Berzelius long ago called attention to the fact (an apparently strange one) that the ashes of seeds do not contain chlorine, although they come from plants the stems and leaves of which give chlorinized ashes. A student of the French Agronomical Institute has recently explained this fact. He observes that the absence of chlorine in incinerated seeds is due to the mutual reaction of the different elements of the ash from which the chlorine is expelled. This ash, in fact, contains ammoniaco magnesian phosphate, which by calcination becomes acid phosphate of magnesia. The latter attacks the alkaline chlorides, becoming neutral, and the chlorine is eliminated. Proof of this is found in the result furnished by seeds incinerated in presence of an excess of alkali. One then finds as much chlorine as in the leaves.

A NEW ELECTRIC CANDLE.—A French inventor, M. Perruche, has presented a new description of electric candle to the Paris Academy of Science. The candle consists of three carbons, two being cylindrical and 0.004 meter in diameter, and applied to each other, the third of square section, 0.005 meter inside, and placed in the angle formed by the first two. The cylinders are in pivoted brass holders between brass plates brought together by a spring. The holder of the square carbon is also capable of oscillation, and the carbon is held by a spring in contact with the other while no circuit passes, but when the current begins takes its separate position, and is regulated by an iron lever and electro-magnet in circuit.—*Electrician.*

Mining Share Market.

During the week there has been some light ripples upon the surface of the otherwiso stagnant pool of stock operations, but toward its closo a more hopeful feeling has been felt, owing to the defeat of the Gorley mining bill, and the consequent belief that there is a sufficient conservative and intelligent element in the Legislature to prevent the onactment of any really ultra laws.

With such unlimited mining resources as this coast possesses, there should be a rapidly progressing husiness in that channel, and a corresponding increase in the wealth of the people derived from this source. It certainly would stimulate all other industries, and find in its own operatious a very wide field for the employment of labor.

Shares in the Eureka Con. mine have been in demand this week, probably owing to the strike in the Dunderberg mine in the same district, where there are now five honanzas being worked.

Even in New York, mining stock matters are rather quiet at present, and of late there have been fewer arrivals from this coast. Only 10% or 15% of the 130 hrokers who have organized the new hoard are Californians. The valuable dividend mines are meeting with a satisfactory market, but there will not be much animation in stocks before May or June, when the new board will he in active operation.

Bullion Shipments.*

Since our last issue, we have noticed the following hullion shipments :

Richmond, Mar. 9, $14,756.36; Mar. 11, $10,599.68; Mar. 13, $12,228.87; Ontario, Mar. 8, $12,115.12; Mar. 10, $5,008.94; Horn Silver, Mar. 8, $5,000; Utah Southern Road, shipped over it in Feb. 2,537,083 lbs. of silver-lead bullion and 2,934,980 lbs. of ore; Paradise, Mar. 8, $3,570; Mar. 12, $3,300; Eureka Con., Mar. 10, 24,835 lbs.; Mar. 13, 27,853 lbs.; Wells, Fargo & Co., at Eureka, Mar. 10, $1,000; Mar. 12, $2,229.93; Mar. 11, $3,100; Mar. 13, $1,000; McCormick & Co., received Mar. 9, $7,650; Mar. 10, $5,680; Mar. 11, $6,050; Mar. 13, $17,580; Barbee & Walker, Mar. 9, $2,049.67; Standard, Mar. 8, $45,941.75; Bodie, Mar. 8, $16,481.88; Noonday, Mar. 8, $10,125.19; Silver Belt, Mar. 1, 11,800 lbs.; value, $800 per ton; Christy, Mar. 10, $1,609.44; Mar. 12, $1,882.56; Northern Belle, Mar. 10, $3,544; Tough Nut, Mar. 11 (one week), $16,000; for Feh., $58,290; Alexander, Mar. 1, $3,024.10; Mar. 3, $4,005.66; Mar. 5, $1,086.60;

*Desiring to make our list of Bullion Shipments as complete as possihle, we will he thankful to receive from mining Superintendents and Secretaries notice of all bullion shipments from their respective mines.

IMPORTANT DECISION.—Judge Lorenzo Sawyer, of the United States Circuit Court, on Saturday, the 13th inst., after a hearing of a motion therefor, granted an injunction in favor of the California Artificial Stone Paving Company against W. S. Perine, enjoining the said Perine from laying down cement pavement separated into blocks hy joints, the joints being formed by cutting the plastic material with a trowel or any other cutting instrument. The defendant contended that, as he did not permanently interpose tar-paper between the blocks of plastic cement, he did not infringe the complainant's patent.

DENIS KEARNEY was arrested last week on a charge of misdemeanor in violating a city ordinance forbidding the puhlic utterance of profane and vulgar language. He was arrested and hailed. At the trial he was found guilty and sentenced to pay a fine of $1,000 and six months imprisonment in the House of Correction. He appealed to the Superior Court and is now at large on hail of $3,000.

FERDINAND DE LESSEPS, the distinguished engineer of the Suez canal, arrived in this city this week on husiness connected with the proposed inter-oceanic canal at the Isthmus of Panama. M. de Lesseps seems, so far, to have made a favorahle impression with the citizens of San Francisco.

SECRETARY SHERMAN declines to retire from the Presidential race.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

MINING NOTES.—*Ledger*, Mar. 13: Allen Tibbets has fixed up his five-stamp mill on the Iowa claim, at Sutter Creek, to run by water power. The ditch and pipe are of sufficient capacity to carry water enough to run a mill of 20 stamps. He calculates the five stamps to crush eight or nine tons in 24 hours. The Oneida mill started 40 stamps on Monday. The same day the prospecting operations, which have been carried on for some months, were discontinued. They resulted in no discoverice of value. The mill is kept running on ore from the upper levels. The outlook is not as encouraging as it might he. The Zelle mill was started Tuesday with 20 stamps. It is running with steam power, but Knight & Co. have contracted to put in water power within two weeks. The machinery runs beautifully. The Yellow Jacket has struck a fine ledge five ft wide, which contains some very rich rock.

BUTTE.

CHEROKEE.—*Register*, Mar. 12: A gold bar, weighing 175 pounds and valued at $50,000, was forwarded through Wells, Fargo & Co. to the United States mint at San Francisco. This bar, although a pretty good-sized one, weighed 87 pounds less than one shipped last summer.

A GOOD NUGGET.—*Mercury*, Mar. 12: Mr. Miller picked up, in Riley ravine, a piece of white porphyry quartz, two inches square by a half inch thick, which yielded $25 in gold. This find has created quite an excitement, and many new claims will he located as soon as the weather moderates.

CALAVERAS.

GRAVEL MINING.—*Chronicle*, Mar. 13: At the Safe Deposit, in Old Woman's gulch, the batteries are kept constantly supplied with gravel, results being favorable. The Rough Diamond, in Chile gulch, another "mill" claim, is being actively operated. The Oreen Mountain tunnel is a steadily paying property—one of the most reliable claims in the district. At the Duryea hydraulic the work of "stripping" is finished and "piping bottom" is to he commenced immediately. In the futuro the discharge from the claim will be through the tunnel at the southern end of the mine. The Bonanza has just concluded a clean-up, a hig one, and piping on a large scale is to he recommenced as early as possible. During the late cold weather the Champion mills, West Point, have been running on "refuse rock," a grade of quartz that it has been the custom to throw away. The yield, although not large, was sufficient to pay all expenses, with a handsome margin for profit. We saw several thousand dollars worth of bullion extracted from such rock in the assay office of C. Schlund. No more of such rock will be thrown away.

EL DORADO.

RICH SILVER STRIKE.—Placerville *Democrat*, Mar. 6: The scene of the new discovery is in Kelsey township, a short distance from the town of Kelsey. At the southern extremity is a round knoll, 400 ft in diameter, compactly covered with huge quartz houlders. Running thence 1,100 ft due north, crossing a ravine in its course, is a large, strong and well-defined ledge, from 8 to 10 ft wide at the surface, which at its northernmost point connects with a like ledge of similar dimensions that runs due east, and has been traced a distance of 1,200 ft. These two are joined at their point of intersection by another ledge or spur, that comes in from the southeast, which is from three to four ft wide and has been traced a distance of about 400 ft. From time to time, for 25 years or more, these ledges have been superficially prospected for gold, but never with encouraging results. Dr. Alderman has a chronic habit of "puttiug in odd hours on rainy days" in assaying fragments of quartz picked up in his vicinity. A few days ago, after indulging this habit on a few fragments from the ledge under considcration, he was no less astonished than delighted to find a rich prospect in gold and silver, the latter largely predominating. Encouraged thereby, he procured average samples from the knoll and from various points along the ledges, and made 32 assays, all of which were nearly uniform in their results, the lowest assay yielding at the rate of $110, and the highest at the rate of $159 per ton in hullion worth about $5 to $6 per ounce, a considerable percentage of it being gold.

FRESNO.

MINING ITEMS.—*Expositor*, Mar. 13: At Fresno Flats several important discoveries have recently been made. Mr. Phelps has sunk a shaft to the depth of 50 ft on his newly-discovered mine, and proposes to get it down to 100 ft. The ledge varies from two to four ft in width, and shows an abundance of free gold. Another rich strike has recently heen made in the lower level of the Fresno Enterprise. A large hody of ore, worth from $300 to $400 per ton was disclosed. Two arastras are running steadily on the richest ore, that not paying over $50 or $80 per ton heing thrown in the dump, to he worked in the future. About $40,000 in hullion was recently shipped from the mine.

LAKE.

INCENDIARISM.—Lower Lake *Bulletin*, Mar. 13: The furnace erected hy Dr. Baker on his cinnabar mine, in the Soda canyon, five miles helow our towu, was hurnt to the ground hetween 9 and 11 o'clock last Sunday evening. Loss, $3,000; no insurance.

MONO.

NOONDAY.—*Chronicle*, Mar. 13: The east crosscut, 500 level, is in 240 ft. The crosscut from the 400 level is in 242 ft, at which point a nice ledge was cut, and are now running on it north and south. On the west ledge, 400 level, have run north 64 ft and south 71 ft. There is 20 inches of good ore in each of these drifts. The winze to connect the 300 level with the 400 is down 103 ft, showing a fine, strong vein all the way down. Driving north on No. 1 vein, on 300 level, and now in 480 ft.

BOOKER.—Driving the crosscut on the 400 level, north and south, and in about 46 ft each way. The vein is looking well, and is from two to four ft thick.

BOSTON CON.—The north drift on the 200 level is in 61 ft, carrying a vein three ft thick, the ore heing of good milling quality. The south drift is in 53 ft. The hody of ore is proven 110 ft, and the vein averages three ft. The incline shaft is now 34 ft helow the 200 level.

ORIONAL SUMMIT.—Sinking the shaft, which is now down 112 ft. When 200 ft is reached, crosscutting will be resumed again. In the crosscut on the 100 level the vein is some 12 or 16 inches wide, and looks very flattering.

BLACKHAWK.—The shaft is down 600 ft. The small veins that have followed the shaft still continue with it, and show a slight improvement. At the 700 level will open another station, and crosscut east and west will he started. The winze on the 320 level is down 85 ft. The vein continues 20 inches wide.

CON. PACIFIC.—An engine and hlower is heing added to the machinery to convey air to the 400 and 500 levels, and a cage, of the latest improved pattern, will he running in the shaft. Stations at the 400 and 500 levels are completed, and drifting and crosscutting for ore veins will he carried forward until the large slice of the valuahle mineral belt covered by the several claims of this company is thoroughly explored.

KING BEE.—*News*, Mar. 14: The shaft is down 165 ft. At 150 ft a very fine ledge was cut, two ft wide, of bright, lively quartz, with well-defined walls, and the assaye averaging $131.13, taken from across the face. This ledge is pitching to the east at an angle of ahout 80°. After passing through this vein and to the hottom of the shaft, stringers and seams of rich clay and quartz from an inch to four or five inches thick, that born out free gold in quantities beyond belief, have been continually coming in the shaft. At the hottom a seam that came in like a knife-hlade is now four inches thick, of the richest character of ore. The tunnel is 140 ft helow the moutb of the shaft and 250 ft north of it. For the first 100 ft the formation is hard cap rock. At this point the formation changes to a vein porphyry; that continues for 280 ft, when hard rock is met and continues as far as run, 32 ft. In the vein porphyry five distinct ledges have been cut, each having well-defined walls and pitching to a common center at the east. The first vein cut in the regular formation is 18 inches wide and yields fine assaye. The second, third and Surprise ledges yield good assays. No. 4 lode is a fine body of ore 12 ft in width with well-defined walls. Between the walls are seams of clay, porphyry and quartz, the quartz assaying from $90 to $1,200 per ton. A drift has been started and run 40 ft on the footwall of this ledge to connect with the shaft.

GOODSHAW.—The main shaft is down 600 ft. The winze on the 450 level is now down 130 ft, all in good milling ore. The last 100 ft the ledge has continued to improve.

DOUBLE STANDARD.—The west crosscut is now in from the bottom of the winze 65 ft and cut through the ledge, which shows a width of three and one-half ft. This is a very important development. Heretofore the ledge carried gold, but it was very low grade; it now shows an average assay of $45. Have started drifts north and south on this vein.

SUMMIT.—North drift, 530 level, is in 130 ft. The ledge is two ft wide. The south drift, same level, is in 140 ft; progress for the week, 17 ft. The ledge is two and one-half ft wide, and looks well. The upraise from the south drift to connect with the Standard is up 28 ft; progress for the week, 18 ft. The ledge is about two and one-half ft wide and looks well.

STANDARD.—*Free Press*, Mar. 14: The main shaft is down 312 ft. The north drift from the east crosscut, 300 level, is in 90 ft. The ledge in the face is three ft wide, of free milling ore. The south drift, 385 level, is in 394 ft; the ledge is two and one-half ft wide, and looks well. Have started on east crosscut from this drift to connect with the north drift in the West Standard mine. The upraise in this drift is up 75 ft; the ledge is six ft wide, of very fine ore. Upraise on the Cook ledge is now 68 ft above the 300 level, showing a ledge three ft wide of good ore. Upraise No. 2, north drift, is up 92 ft. The ledge is four ft wide. North drift on east ledge, 300 level, incline, is in 109 ft; ledge two and one-half ft wide, of good ore. The south drift from the west crosscut, 300 level, incline, is in 210 ft. The ledge is five ft wide, of good ore.

BELVIDERE.—The joint south drift is in 100 ft. The ledge is four ft wide, of good ore. The main west crosscut is in 96 ft. The south drift is in 39 ft, with a ledge four ft wide. The north drift from the top of the upraise is extended 23 ft north of the sbaft, showing a four and one-half ft ledge of ore worth $75 to $100 per ton.

UNIVERSITY.—The sbaft is down 400 ft. The rock continues hard.

BULWER CON.—The north drift on the Ralston ledge is in from the tunnel 91 ft. The ledge is three ft wide, and looks well. The south drift is in 92 ft. The ledge in the face is two and one-half ft wide, of good ore. The stopes are looking well.

JUPITER.—On the 500 level the west crosscut from the main south drift is in to-day 137 ft, and the west crosscut from south drift No. 2 is in 85 ft.

yielded thousands of dollars. This covers the Mendota, Spanish Ranch tunnel, Queen Sahe, Deep Hole, Garland's Lava Beds and the Bolyar claims. To the north we have the Summit mining company and Challens & Andrews' prospect in the mountain that fed the old Sharp's Ravine claims, which were famed for their rich pay. Here we have a deposit of gravel extending north through the mountain to the east branch of Feather river; west to the Mountain House No. 2. This deposit is 10 miles in length and 5 in width, and the gravel has fed the Brandy Flat, Spanish Creek, Orub Flat and Chinatown diggings. To the west and south are the Silver Creek diggings, where gravel deposits are the washings from Spanish peak, Burton's gulch, and sundry otber ravines that have paid richly; also the Scad Point claims. In this neighhorhood is the Plumas mine. The rock in the dump pile tells the story, to say nothing of the specimens which they have to put under lock and key. The last are marvelously rich. At Spanish peak extensive operations are in full hlast. The Monte Christo mining company, of Chicago, commenced operations last fall to open up the Spanish Peak blue gravel deposit. Southeast of Spanish Ranch we find the Grizzly Ridge mining company, running a long tunnel, with flattering chances of striking the blue lead. A little east of this are the Hungarian Hill gravel mines.

NEVADA.

NEVADA CITY.—*Transcript*, Mar. 14: Drifts have been run north and south 500 ft on the 150 level, ore taken out and a large quantity ready for stoping. The ledge is from two and one-half to three ft tbick. About 300 tons of ore have been crushed, averaging $30 per ton.

CONSTITUTION.—Situated on Deer creek above the Murchie. The incline is down 100 ft, and a drift is heing run on the ledge, which is from 18 to 24 inches thick. The ore is among the richest ever discovered in this county.

PLUG HAT.—Ore taken from the croppings paid $1,300 a ton in spots. A crushing lately paid $23 a ton in free gold, hesides the sulphurets. There are 50 tons of ore on the dump. The incline is down 50 ft.

PITTSBURG.—This mine, which bas been in operation for many years, and is developed to a depth of about 800 ft, more or less, is heing worked on the tribute plan at present. The last crushing paid $5.25 to the man per day.

GENERAL GRANT.—A new tunnel, 700 ft long, is to he run, tbe cut having already been made. Tbis tunuel will give 150 ft hacks on the ledge, which is 15 inches thick. The ore has averaged $25 a ton, some of it going as high as $30.

FEDERAL LOAN.—The average rock taken out has yielded $25 a ton, some going as high as $50. The incline is down 180 ft.

NEW OPHIR.—This is a recent relocation of the old Allison mine on Selby flat. It is held hy four first-class, practical miners, who have taken out 40 tons of ore tbat is of a bigh grade. They are now erecting an arastra to he run by water power.

MERRIFIELD.—The incline, having reached the 600 level, is now heing sunk 200 ft more. There are three ledges, from three to ten ft thick, in the fissure. The ore is very rich in sulphurets. Fifteen stamps are kept constantly running, and crush about 900 tons of ore per month. The milling capacity will soon he increased to 1,500 tons per month by adding 10 stamps, and four more Frue concentrators—making 10 in all—will he put in. New chlorination works are also to he erected this summer. A new three-compartment incline is being sunk on the hill 1,600 ft north of the present incline, and is already down 300 ft. The elevation of this incline over the lower one is 350 ft perpendicular. A tunnel is heing run from the top of the old incline to connect with the new one at a distance of 700 ft from the mouth. The tunnel is now in 1,400 ft. The machinery at the creek is all run with two overshot wheels during tbe winter. In the dry months, three engines are employed, hesides the one on the hill.

JULIA.—The owners are running a tunnel to tap a strong ledge, which they found, by a shaft, and from which they took some good ore.

MT. AUDURN.—Is on the Newtown road a short distance west of this city. Hoisting works have been started within a few months. The incline is down 250 ft, running part of the distance under the ledge. Drifts were started at the 250 level.

DEADWOOD.—The main incline is down 500 ft on a very flat ledge dipping to the northwest. About $50,000 were produced last year, and four dividends were paid by the company who leased it, hesides $150,000 taken out by former owners. The quartz yields from $20 to $60, and is rich in sulphurets.

PLACER.

JACOBS & SARGENT'S.—Dutch Flat *Forum*, Mar. 11: While sinking the new sbaft 35 tons of ore were taken out which yielded $600 in gold.

PLANET.—About 52 carloads of gravel, taken from the drift, was washed; result, $66 in gold. The gold was fine, which proves that the center of the channel is not reached.

ORIFFITH CON.—*Mountain Democrat*, Mar. 13: A considerable amount of fair-milling ore is on the dump. There is a large amount of bigh-grade ore in this mine. A piece of gold bullion nearly as hig as a $20 piece is the product of 38 pounds of ore. Samples of sulphurets from the tailings yielded over $100 per ton.

PLUMAS.

MINING NOTES.—*National*, Mar. 6: In the neighborhood of Spanish Ranch we have the Plumas mining and water ditch company, with 200 acres of good gravel deposits and 21 miles of water ditches. Said ditches command some of the richest claims in the county, independent of Badger and Gopher hills and the Metcalf claims. These claims are worked with hydraulic water power three giant pipes, under 400 ft pressure. From them for about four miles is a rich deposit of hlue gravel that has

TUOLUMNE.

VALPARAISO.—*Independent*, Mar. 13: Is on Jackson flat. Its product amounts to $100,000.

PETTERSON.—It has been worked, off and on, for nearly 25 years with fair profits.

GILLIS.—Formerly the Carrington; is similar in its formation and character of ore to most other neighboring veins. It is a good paying mine. The proceeds of past years amount to no inconsiderable sum.

ATLAS.—Formerly the Waters. They have a 20-stamp mill; it is the best constructed and most substantial mill ever erected in the county. The shaft is down on the lode 85 ft, with a 100 level and a cross drift 22 ft. Yet at this depth the walls have not been found—all vein matter. The surface showed 18 ft between the walls. The ore differs from any in the county. The vein matter is in alternate layers of, first, pure white quartz, from one to three inches thick; then what much resembles sedimentary deposits of a grayish cast. Both strata are heavily charged with sulphurets which carry a large percentage of gold per ton. Though a low-grade ore it can he made a paying mine if the yield is hut $5 per ton.

NEVADA.

WASHOE DISTRICT.

OPHIR.—Gold Hill *News*, Mar. 15: The main incline has a depth of 67 ft, on the slope, below the 2500 station, passing through some quartz. On tbe 2500 level the main north drift is in 250 ft from the incline. The east drift has a total length of 178 ft. On the 2300 level the joiut Mexican east crosscut on the northern boundary is now 166 ft from the main north drift. On the 2200 level the north drift in the Hardy vein has a total length of 148 ft from the main southeast drift. The raiso from the end of the south drift is up 21 ft. On the 2100 level they have started a drift north from the bottom of No. 1 winze. It is now in 21 ft, and shows low-grade ore in the face.

BELCHER.—The wiuze now heing sunk on the 2760 level, 25 ft east of the ore streak, has reached a deptb of 48 ft. On the 3000 level the south drift is now in a distance of 227 ft.

CALIFORNIA.—During tbe past week 216 tons of ore have been extracted. On the 850 level west crosscut No. 2 is now in 60 ft. On the 1500 level the west crosscut has heen extended 25 ft. On the 2200 level, the joint east consolidated crosscut on our southern boundary is in 160 ft. The C. & C. shaft is sunk and timbered 80 ft below tbe 2200 level.

OVERMAN.—During the past week east crosscut No. 2 has heen extended 51 ft through hard vein porphyry. Upraise from 700 level bas heen extended 38 ft through quartz and porphyry. Forman sbaft has heeu sunk and timbered 20 ft; total length, 960 ft.

CAMPBELL DISTRICT.

NUTMEG.—*Silver State*, Mar. 8: They have sunk two shafts, one 70 ft and the other 50 ft deep, the ore from which assays from $40 to $300 per ton, and carries considerable gold and some galena. The ledge is from two to five ft wide.

EUREKA DISTRICT.

EUREKA CON.—*Sentinel*, Mar. 15: The following work has heen done in the several levels: 2d—North drift continued 42 ft; now in 57 ft. 3d—North drift continued 24 ft; now in 193 ft. 7th—North drift continued 47 ft; now in 86 ft. Northeast drift continued 23 ft; now in 200 ft. 8th—Southeast drift continued 26 ft; now in 208 ft. 9th—West drift continued 10 ft; now in 100 ft. 10th—East drift continued 25 ft; now in 215 ft. 11th—North drift continued 21 ft; now in 121 ft.

RUBY CON.—The 500 level has heen connected with the winze, thus ventilating the mine and enahling the crosscut to be commenced in the Home Ticket. Already a small hunch of ore has heen met with. The lode will be intersected 50 fathoms helow where they are now working, and where there is a vein of ore from two to four ft wide, of good quality, and yielding profitable results.

THE STRIKE IN THE DUNDERBERG.—One of the most important events in the history of Eureka district was the striking last week of a hody of pay ore on the 400 level of the Dunderberg mine. The ore found is entirely independent of any ore body ever struck in the vein before, and its being in virgin ground speaks well for Atlas hill, or rather the southern portion of the great mineral helt in which the Richmond and Eureka Con. are found. The ore is 12 ft wide and still making in the face of the drift. It has heen opened upon its course a distance of 15 ft and shows improvement as the drift is advanced. The average assay of the ore is $60 per ton—two-thirds in gold.

WINNEMUCCA DISTRICT.

REFORM.—Reuo *Gazette*, Mar. 8: Has struck something different from any of the rock heretofore found in the country north of Reno. It is a heavy looking metal in a matrix of very handsome quartz. There is evidently a good deal of iron in it, hut the assays also show silver to the amount of $35 to the ton. The discovery increases in importance as it is developed.

ARIZONA.

SURPRISE.—*Silver Belt*, Mar. 6: Shows a 2½-ft vein with a 12-inch pay streak, at the hottom of a 30-ft sbaft. The character of ore is silver glance, of a very high grade. The result of a recent assay gave $1,082.

STONEWALL.—At the hottom of a 65-ft shaft they have an 18-inch vein of ore, assaying up into the thousands.

NORTHERN LIGHT.—This mine is situated two and a half miles from town, and can he traced for over 5,000 ft. The average width of the ledge is 30 ft, and assays from 18% to 25% copper and from $8 to $30 in silver. It is known as the True Blue.

EMELINE.—The Emeline mine continues to pan out well. The ledge is four ft in width, is strong and well defined at 20 ft in depth, carrying a 12-inch pay streak of 400 ounces milling ore.

BUFFALO.—The vein has improved from the surface down and shows seven ft in width at the depth of nearly 100 ft.

SEA.—Has a shaft 35 ft deep, all in rich ore, assaying from $100 to $17,000 per ton.

OLD HAT DISTRICT.—Cor. *Citizen*, Mar. 8: The American Flag sbaft is down 31 ft, and there is on the dump, ore worth $12,000. It contains about equal proportions of gold and silver, and the latest assays from the bottom of the shaft average $264 per ton. On the Pioneer, the new shaft is peing pushed ahead, and will strike the ledge at 75 ft from the croppings. The Good Luck, which is parallel to the American Flag, shows a vein of about four ft, the ore assaying from $60 to $120 per ton. The Jimmy Lee looks very well, the ore running high in both gold and silver, with a large ledge to draw from. The Black Bear has a shaft down 32 ft, with a 3½-ft vein, the ore assays averaging $90. The Bullion, joining the last mentioned mine has a shaft down 15 ft, assays from which average $30 per ton.

VERONA AND COMPROMISE.—The croppings are from 40 to 100 ft in width, and vary from 10 to 20 ft in hight, assaying 20 ounces to the ton. The incline which is down 65 ft, has heen sunk on the footwall. At a deptb of 75 ft a crosscut will be run across the ledge to ascertain its widtb. Some assays from the bottom have ebowed 100 ounces to the ton. All the ore can he easily smelted by the ordinary furnace.

MONITOR.—Tombstone *Nugget*, Mar. 4: On the entire

The Debris Question.

Col. Mendell's Report to the Chief of Engineers.

Lieut. Col. Mendell, of the Board of U. S. Engineers for the Pacific coast, has made the following highly interesting report on the debris question to the department at Washington:

SAN FRANCISCO, February 20, 1880.

The Chief of Engineers, Washington, D. C.—GENERAL: Various annual reports on the improvement of the Sacramento river of this State, beginning in 1876, have made mention in a general way of the relation of hydraulic mining to the navigation of the Sacramento.

Filling in of Steamboat Slough.

The last annual report included a comparative profile of the bed of Steamboat slough (one of the principal channels of the Sacramento), as plotted from Wilkes's survey of 1871, and the survey of 1878. This showed a maximum filling of 22 and a mean filling of 8 to 10 feet. This comparison is not owing to the uncertainty as to the base of levels of the exploring expedition insisted upon except to demontrate the fact of a serious filling.

What Has Happened at Sacramento.

The same report showed as a result of the survey of 1878, that the plane of low water at the city of Sacramento has been raised about 5 feet since the occupation of California by Americans. The tide, which 30 years ago produced an elevation of about two feet at Sacramento, and made itself felt as high as the mouth of the Feather, now does not sensibly extend above Heacock shoal, 9 miles below Sacramento.

A survey of the river in front of the city of Sacramento for a distance of two miles, in 1854, by authority of the Town Council, shows in comparison with our survey of 1878 a mean filling over this distance of 15.2 feet and a maximum filling of 25 feet. This comparison was made by the State Engineer.

The State Engineer finds the filling of the river at the mouth of the Feather to be 3 to 4 feet; at Marysville on the Feather to he 13 to 15 feet; at the Yuba mill, on the Yuba river near where it emerges from the foothills in a part of the stream that never was navigable, 68 feet; and at Smartsville, still further in the foothills, at the outfall of some larger mines, the filling is reported to be 125 feet. The pools in the Feather have also been very much filled. The tendency of the river under the great loads of material imposed upon it is to take a grade which tends constantly to get steeper.

Steamboat slough, which was formerly the shortest and deepest of the two arms of the Sacramento, is reported, on good authority, to have been filled a good deal since the survey of 1878—so much so that it has been abandoned as the usual route of river boats.

Navigation of the Lower Sacramento.

The navigable condition of the lower river has also suffered very much, owing to the same cause, but not in proportion to the actual filling. The mean depth has been lessened in a much greater proportion than has the maximum depth.

The filling in the beds of the Sacramento and Feather rivers is mainly sand. Many borings in the Sacramento were made in 1878, almost always with the exposure of sand. At the mouth of the river and in some bays where the current is feeble there is a deposit of sediment or "slickens," as it is locally called. This is a mixture in a fine state of division of clay and extremely fine sand. It is suspended with such facility that it may almost be called soluble. It gives the yellow or tawny color to the waters of the running rivers and imparts to the waters of San Francisco bay a feebler, although a distinct shade of color. The "slickens" do not appear to rest in the main river. When they reach the channel they are carried by its current to resting places in the lower bays, and perhaps, in part, in the ocean.

The other products of hydraulic mining are sand, both silicious and micaceous, gravel of all sizes to stones, which may appropriately be called cobblestones, as they reach the foothills. As they leave the mining sluices they are, in many cases, much larger.

I enclose a map of the lower Sacramento and its tributaries (Appendix A), covering the parts of the mining districts now under consideration. The names on the map in the mining districts are those of prominent mining points. The Feather and American rivers drain the greater part of these districts. The Yuba, which joins the Feather at the site of the town of Marysville, is also an important mining stream. Upon these last two streams the consequences of the state of affairs that has existed in this country for a great many years have been more fully developed than elsewhere. In order to exhibit these results in an effective way, I enclose maps of the Yuba and Bear rivers for a few miles of their course. These maps are obtained through the courtesy of the State Engineer department—(Appendix B and C).

Deposits of Mining Detritus.

A few words may be said in explanation of the Yuba map. The shading denotes the deposits of mining detritus. This deposit opens out as the river is released from confinement in the foothills. It attains a width of 6,400 feet, and is estimated that it has thus far covered 14,600 acres in the plains, much of which was alluvial land of value.

The crop section on the Yuba map shows the elevation of this mass of detritus to be here above the general level of the country. This general level is the second bench of the bank, the first being covered. The original bed of the stream is said to have been 10 or 12 feet below the lower bench.

The same general descriptions may be given of the deposits on the Bear river.

These rivers, after reaching the plains, no longer flow on natural channels, but make for themselves beds which change from year to year, and which are in many places above the adjoining farming lands. These lands are protected from the flood water and from the mining deposits by levees, which, year by year, have to be built higher and higher to keep up with the new deposits which are yearly added. When the levees give way, which is not an unfrequent occurrence, the lands adjoining are covered with a deposit. In places where the flood water stands quite long enough, a thick crust of slickens forms on the land. The thickness runs from a film to perhaps a foot. The sand and gravel are generally deposited close to the site of the breach.

The losses that the farmers suffer yearly from this cause, and the apprehension of future disaster of still greater magnitude, have given rise to a good deal of contest in the courts and legislatures. It now exists in the Legislature of California when the great questions of agriculture and mining are engaged in controversy. There is much to be said on each side of the contest.

Hydraulic Mining.

The great source of the evils that have been briefly sketched is admitted to be mining. The main existing cause is hydraulic miuing. Quartz mining and other mining than hydraulic have their influence; but their sources are relatively so insignificant that they may be neglected in comparison with hydraulic mining.

Hydraulic mining makes a profit out of gravel or earth which contains six or eight cents in gold to the cubic yard. It does so by making water do the work that in other mining is done by machinery or hy manual labor. Water excavates the mountains and carries the detritus to the dumps out of the way. Water also brings this detritus from the dumps, which are generally iu gorges of the mountains, to the plains, the river beds or ocean beds, wherever it comes to rest.

When the water is made to excavate it is used under a pressure of 100 to 300 feet, and is discharged against the bank from a nozzle that may be 5 inches in diameter, and in some cases is 9 inches. This same water conducted in sluices of 4 to 6 feet wide, on a grade of 200 to 300 feet to the mile, carries the excavated detritus to the outfall or dump. New material accumulates at the dumps until the freshet in the channel carries it below. The streams at the upper mines have a fall of 70, and perhaps 100 feet to the mile. A freshet with such a fall makes rapid destruction of a dump.

Capital Invested in Mining.

This rapid and cheap handling of earth or gravel is made possible only by large investments of capital. These investments are made to bring water from higher altitudes, so that it can be used under the necessary pressure. The water is brought in ditches 40 miles, more or less, long, built in a country which, for vertical dimensions and steep slopes, is almost unequaled. These canals are bold in the extreme. Inasmuch as the streams do not furnish sufficient water at all seasons, it becomes necessary for the miner to store water from the melting snows, which he does in large reservoirs, which are also admirable specimens of their kind. These reservoirs are well up towards the summit of the Sierra Nevada. Several are shown on the map, as the Fordyce, the Bowman, the English and the Meadow Lake.

The construction of the canals, reservoirs and sluices from the mines to the dump, which is often through a tunnel some thousand feet in length, are all preliminary to the actual operations of mining. These constructions have, in some cases, required several years time, and in the case of the North Bloomfield, required the expenditure of about two millions of money. In these circumstances lies one of the main appeals of the miners. In many cases the principal has not been returned, and cannot be returned unless the system is allowed to continue.

Responsibility for Accumulation of Debris.

Although the hydraulic miner is now unquestionably responsible for the continual accretions that raise the levels of the beds of the water courses year by year, yet the history of these deposits show that he is not responsible for all that is past. Hydraulic mining, in the effective form it now presents, is of quite modern growth. The earlier mining done from 1848 to 1860 was done by manual labor. Water was used to work out the gold, but was not used to excavate to any great extent. The water was not used under pressure. During these years, and especially during the first five or six years, counting from 1848, many thousands of men were employed in placer mining all through the gold districts. During all these years there was no great flood. The winter of 1861-62 was the occasion of the severest flood California has known since 1848. This flood found all the little gulches and the beds of larger streams stored with the material resulting from 10 years' mining. This freshet brought the sand and gravel down in immense quantities. Whatever filling of the channel may have taken place previous to this time, it appears to have escaped notice. The winter of 1865, which gave high water, increased the evil. The placer mining had been nearly, if not entirely, exhausted by this time. Each successive flood has made things worse and worse.

It has been said that a profit can be made out of earth that contains a few cents of gold to a cubic yard, but in order to accomplish this a large investment of capital must be made in procuring a sufficient supply of water under an adequate pressure.

It will now be understood that in order to return a good interest on large investments larger quantities of earth must be handled.

What Water is Required to Do—Quantity Used.

The quantity of water that a mine uses is generally pretty well known, at least approximately. The quantity of earth that is moved has not generally been a subject of interest to the miners, and for that reason our information on this subject is not as full as is to be desired. In a few cases the amount of excavation has been measured and some attempts have been made to obtain general results as to the amount of excavation that can be made with a given quantity of water. This amount varies with the character of the material, with the slope of the hill and with the pressure of the water. It is not here proposed to go into detail on this point, but it seems desirable to convey some sort of an adequate idea of the results of this kind of excavation.

An inch of water running for 24 hours is taken to be 2,230 cubic feet. On the San Juan ridge, between the South and Middle Yuba, the State Engineer reports that in the year beginning November, 1878, 2,819,317 inches of water were used, while the quantity ascertained to have been used during the same time in the drainage basin of the Yuba is 5,893,962 inches.

An inch of water will excavate at all rates from 1 to 7 or 8 cubic yards of earth. The Spring Valley mines at Cherokee have been excavated to the extent of 23,000,000 cubic yards in seven years, with an average quantity of 2,250 inches. Allowing 310 days to the year, the daily excavation for an inch of water is about four yards. The material here is very light, mostly sand, fine gravel and clay in cliffs 400 feet high. The grades of the sluice is perhaps an average, being 1 foot in 24.

Quantity of Earth Deposited in the Streams by the Mines.

It would, perhaps, be an excessive allowance to apply this rate of excavation to the Yubas. It is, however, within the probable limits of truth to place the amount of material excavated in the basin of the Yuba at 2½ yards to the inch. This allowance makes the yearly amount placed in the stream and its tributaries at 14,000,000 or 15,000,000 cubic yards. On the other mining streams, the Feather, Bear and American, there is no reliable information as to the amount excavated and deposited in the streams.

The attempt has been made to estimate the quantity of material in the Yuba and Bear rivers that have not yet reached the navigation lines, but which lies in the path of the floods, and is, therefore, liable to be washed farther and farther, in greater or less degree, by every freshet. These deposits are the result of past mining. If no more were added, they are yet capable of doing a great injury to the water courses below.

The amount lying in the bed of the main Yuba and its branches, above the Yuba mill, is 49,263,200 cubic yards. The amount below the Yuba mill as far as Marysville, 14,600 acres covered, average depth assumed to be 4 feet, is 94,288,664. Total, 143,551,864.

On the Bear river the estimate is 148,248,000, of which 62,088,000 lies in the plains, and 86,160,000 cubic yards are in the bed of the stream above the foothills. This estimate makes the total amount in the two streams to be 291,799,864 cubic yards. It is not pretended that this estimate is accurate. It could not be so without boring the deposits in thousands of places. It is made from the best information available. Its use, in its imperfect accuracy, is to convey to those who have not the opportunity of seeing it some conception of the enormous dimensions of the phenomenon.

The character of this deposit has already been defined. It is sand, gravel, slickens and stones. The part that has reached the plains to this time is sand, gravel and slickens. The layer of gravel and cobbles remain, as yet, in the foothills. There is some coarse gravel in the Yuba, four or five miles below the Yuba mills.

The Yuba having been filled 125 feet at Smartsville, and perhaps 15 feet at Marysville, the slope of the river between these points, a distance of 18 miles, has been increased 110 feet, which is about six feet per mile. This about doubles the original slope.

The tendency to increase the slope of this part of the river brings the gravel lower and lower. This is counteracted, to some extent, by the great breadth of the stream in the plains at high water. Small gravel is, however, found now in small quantities within three or four miles of Marysville. With the increase of slope under the influence of freshets we must expect this gravel to reach first the Feather, and in due time the Sacramento. Once in either of these streams in considerable quantities, it cannot be expected to move under the influence of the current, or if it did, the effect would be to transfer it to a more objectionable place. In the Feather the pools that formerly alternated with ripples have been filled. It is estimated by the State Engineer Department that there is a deposit in the Feather of 40,000,000 cubic yards, and in the Sacramento below the mouth of the Feather something like 100,000,000 cubic yards.

Future Mining.

The quantity of material that remains to be excavated at the mines by hydraulic process cannot be stated with any particular degree of accuracy. This quantity is, however, known to be very large. The quantity remaining in the San Juan ridge between the South and Middle Yuba was estimated by James D. Hague in 1876 to be 700,000,000 cubic yards. The following quotation from a printed report made by this gentleman illustrates this statement:

"The linear extent of the gravel channel and its branches in this ridge is about 25 miles. Deducting liberally for the portion already worked, and for that too deeply covered by lava, to be available for hydraulic mining, there remain probably not less than 14 miles of channel available for working, from which only a comparatively small portion of the top gravel has been removed. Below San Juan the gravel body has a surface width of over 1,000 feet and is, say, 140 feet deep. From Badger Hill to Bloomfield it is for the greater portion very much wider and deeper. At Columbia Hill its surface width varies from 3,000 or 4,000 to 8,000 feet, and is from 300 to 600 feet deep. The gravel at Lake City is probably 300 or 400 feet deep. At North Bloomfield it is opened to the bedrock, showing a depth of more than 300 feet. Roughly estimating the average width of the remaining gravel range at 400 yards, and after allowing for the portion worked off, placing its average depth at 70 yards, the sum is an average of 50,000,000 yards per mile, or for 14 miles, say, 700,000,000 yards. There are, so far as is known, no means of estimating the contents of other gravel deposits in the drainage basin of the Sacramento, nor is it necessary for the purposes of this report that this amount be now known. What is fairly known is sufficient to justify a conclusion."

The preceding description enables us to forecast with certainty, in every respect but time, the disasters which impend over the valleys and their water courses. The great gravel deposits on the flanks of the Sierra Nevada occupy the channels of an ancient drainage system, which was obliterated by an enormous movement of gravel and boulders brought from higher regions, perhaps, by glacial action. New drainage lines were in time excavated by erosion, and these, in turn, are now undergoing a process of obliteration which, if less magnificent in the scale of movement of material than the ancient natural action, is no less certain of its results.

It is hardly necessary here to say anything as to the probable alignment of the third and last drainage system which will replace that which now exists. It is sufficient to appreciate that the result, be what it may, will bring disaster to a large portion of the State.

Storage of Mining Detritus.

It is then of the first importance to know what can be done to remedy or mitigate these evils that have been described. This description has been directed mainly toward showing the injuries to which the rivers are exposed. There are other features that are only secondary in importance. The elevation of the bed raises the flood line and gives to an ordinary freshet the terrors of a flood.

The riparian strips of country are constantly threatened with overflow, and all the country which depends on the rivers for communication finds the efficiency of navigation impaired.

Relief from the certain increase of evil that must result from a continuance of the present system of mining can be given only by a restraint of the mining detritus by storing in places where it can do little harm. This mass of material must be stored in reservoirs, the best place for which is in the foothills of the Sierra Nevada. The reservoir must be made by placing dams across the beds of the streams into which the material is discharged from the mines.

Material for Dam Construction.

Well up in the foothills there is an abundance of stone. This is the material of which to make the dams, which will be a mass of rip rap, the pieces being of sufficient weight not to be moved by the freshets. The dam will therefore not be water-tight, and being composed of stones without bond, we are enabled to found it on the gravel without the necessity of going to bedrock below. It is, therefore, an obstruction rather than a dam. The slopes of the mass will depend upon the size of the material. With large stones of several tons weight the lower slope may be one base. The only disaster that can come to such structure is settlement. If it should be undermined at the foot of the slopes, it will settle, and can be restored by the addition of stone. The construction is inexpensive, involving no skilled labor.

Now suppose such an obstruction placed across the bed of the Yuba, the storage capacity will depend upon the slope the material takes under the action of the freshets. The slope of the detritus now in the bed at this point, as it was left by last winter's freshet, is about 22 feet to the mile. If we assume this as the slope when the reservoir is full, the estimate of the storage, based upon the surveys of the State Engineers, show that a hight of one or more obstruction, making a total of 50 feet, placed just above Deer creek would hold back about thirty million cubic yards. Taking the slope of ten feet to the mile, the same obstruction would hold back seven and a half million yards.

If you suppose the material mined on the Yuba to be stored, it would not be two years before the larger capacity here mentioned would be exhausted.

It cannot be expected, however, that all the

detritus will be stored. The slickens and soms proportion of the sand will escape. What that proportion may be experience must determine. We can safely say that a very large proportion will be retained, and that in this respect, the condition will be improved.

When the necessity for more storage approaches, let us suppose another dam built of suitable hight placed further up the stream, and so on in succession as may prove to be necessary. The width of the bed of the Yuba at the dam site is 300 feet. There ie a depoeit in the bed of 30 feet of sand, gravel and stoues. The side slopes of the mountaius rise to a hight of perhaps 1,500 feet, and have an inclinatiou of 35° to the horizon.

Tha base of the first dam is 300 feet. Fifty feet higher the width of the valley will be 440 feet, and each succeeding hight of 50 fset would widen ths stream 140 feet. The hight that it may be prudent to give to these dams depends so much on the material and circumetances in each case that it must be left for future cousideration.

The following table gives the storage capacity for different hights on the assumption that the material takes a slope of 10 feet to the mile. The quantities in thie table are used as a basie for an approximate estimate.

Table showing the quantities of material in dams, and quautity thet can be impounded at different hights, the present width of hed being assumed at 300 feet and side slopes of 35°:

No. of Dam.	Hight—Feet.	Total Hight—Feet.	Stone in Dam—Cubic Yards.	Storage Capacity—Cubic Yards	Total Storage.
One	50	50	32,000	7,537,000	7,537,000
Two	25	75	30,777	12,164,000	19,701,000
Three	25	100	35,240	16,150,000	35,851,000
Four	25	125	39,212	22,740,000	58,591,000
Five	25	150	43,783	25,408,000	83,999,000
Six	25	175	48,255	27,908,000	111,907,000
Seven	25	200	52,726	30,550,000	142,517,000
Eight	25	225	57,197	33,150,000	175,667,000
Nine	25	250	61,670	35,738,000	211,405,000
		300		79,258,000	290,663,000
		400		189,628,000	480,289,000
		500		231,106,000	711,395,000

In this calculation no allowance is made for the increaso of reservoir by tributary streame, nor for extension up stream above the original length aesumed, namely, 40,000 feet. If, then, the dimeneions turn out to be as here assumed, tho storage in the table is much too emall. The dimensions aeeumed are an average given by the State Enginoer Department.

The economy and comparative stability of low dams are plain. Two 25-feot dams require about two-thirds the quantity of stone of one 50-foot dam, giving the same storage capacity.

The contents of the dam are calculated solid, without allowance for voids, and to each volume 20% ie added for paving below the dam. In the first three dame, taken ae a whole, one cubic yard of stone impounds 242 cubic yards of detritue. For the other dams, one cubic yard of stone impounds about 580 yards.

There is some difficulty in estimating the probable cost of these dams. Good authority places the cost at about $1 per yard. The material ie known, for some dame at least, to be convenient in the hills above. It is proposed in the absence of full information to adopt higher rates, which are assumed as follows:

Average for first three dams, $1.50 per yard; for remaining dams, $2.50 per yard. With these rates the cost of the first three dams will be $222,025, storing 35,700,000 cubic yards, being about three-fifthe of a cent per cubic yard stored. For the upper dams, the bed of the stream having taken the slope of 10 feet to the mile, the expense becomes reduced, per cnbic yard stored, to less than one-half a cent.

The above is as fair a statement of the probable cost of this syetem as can he predicted from our preeent information in regard to the Yuba. This river ie the principal seat of this kind of mining, and it has received the moet attention.

We are not prepared to go into the same kind of calculation as to the American or the Bear. There may be some objections in the latter streams to this storage, for the reason that it may interfere with the outfall of the mines. The cost will probably be less in these mines for the reason that the amount of mining is less than on the Yuba.

Alternatives Presented.

This system of etorage, the cessation of hydraulic mining, and the destruction of the navigable rivers of the interior are the alternatives which present themselves for consideration. It is true that the last alternative is not without qualification, as will be seen further on, when the diversion of some of the tributaries of the Sacramento is considered. It is to he remarked that this diversion is in itself destructive to our navigable line, and that it does not afford relief to the city of Marysville, and to the farming lands adjoining the mining rivers, which are now so seriously threatened.

How the Dams may be Made.

The purpose of these dams is novel. The mining dumps, however, in the rivere where the material is large, as at Smartsville, play the same part and store material above them. The eecurity of these dams depends upon the stability of the laver elope. The stones on these slopes must be so large as to hold their places under the floods which pass over them, and the positione they are made to take muet be of studied irregularity so as to destroy velocity hy falls.

Ths first dam of ths seriee in ths most important, and will require ths most particular care in its conetructiou.

Ths cost of these dams, it must be admitted, cannot at present be closely forecast. The prices that have been assumed are much in advance of those that are given by good authority in such matters. It remains for experience to indicats what this cost will be. If we doubls the estimates that have beeu made the per cubic yard etored will yet be moderate.

The mines about Smartsville aro among the best. There are also mines at Timbuctoo and Sierra Flat on the Yuba. All these miues are below the eitee of the dams at Deer creek. We must storo the detritus of these miues lower down. Going down to the edge of the foothills, ws find a place which is about 6,000 feet wide from high laud on one side to high laud on the other side. This is a very good eite for a dam, which will have to be made of brush. The material is convenieut in the slope of the thick growth of willowe which epring up on the mining deposits. The storage area belcw the Smartsville dumps is ahout 2,700 acres, which covered to a depth of 10 feet will give a reeervoir capacity of 43,500,000 cubic yards. This reservoir will help to restrain the sand which may escape from the upper storage.

The long crest of this dam will make a safe overfall; a large part of the dam material will be constantly wet and therefore durable. It will, however, require repairs from time to time.

The detritus that lies in the plains below the foothills can hardly be raised higher than it uow is without danger and certainly alarm to the farmers where lande adjoin. By directing the course of the Yuba river through the plains, it is believed that it can be made to create and maintain a bed, provided new accretions of eand are preveuted. The treatment will require the transfer of a relatively emall quantity of the detritus to the drainage channels below.

Treatment of Bear and American Rivers.

The Bear river requires almost ideutical treatment with the Yuba. It ought to have a dam at some point in the mountaius. This river has not bsen examined with the eame care as the Yuba, aud therefore an estimate cannot be made with the same defiuiteness. A second dam ought to be built at the edge of the plains near Camp Far West.

The same treatment is required for the Americau river.

When the Dam Should be Built.

If this description of the existing state of affaire ie at all adequate, it will not be doubted that the necessity for these works is urgent. It is etrongly recommended that these dams be built during the coming summer. The proper time is during low water, which extends from August to October. During this period there is little water in these rivers, except that which comee from the ravines, and consequently there will be little difficulty, due to the presence of a strong current.

At the dam eite in the Yuba, near the mouth of Deer creek, the rise of high water is stated to be 11 or 12 feet. The freshets are generally of short duration in the winter, the greater part of the precipitation being in the form of enow. A eecond high stage lasts through May and June, during which time the snow is melting. This latter stage is believed to be not so high as the winter freshets, although much longer.

The storage of mining detritus in the mountaine being successfully disposed of, the future will probably he relieved from the immense accretions of sand that now escapes yearly from the mines. Thie ie an immenee advantage. But it remains to point out another resource that is open for the further protection of the Sacramento river. The full investigation of thie plan as to its cost and probability of proportionate benefit, will have to be left for a future occasion.

Raising the East Bank of the Sacramento River.

It may be noticed on the map of this region, that the Sacramento is bordered by lowlande represented by shaded lines. One of these low districte liee hetween the Feather and American rivers, on the east side of the Sacramento. Some parts of this land are repreeented to lie as much as 20 feet below the banks. The average depth hae been estimated at 12 feet. The area is eaid to be in the neighborhood of 60 square miles. Admitting these etatements to be exact, the storage capacity of this basin, filled to the banks, will be about 7,000,000 cubic ynrds.

It is believed to be practicable to turn the Feather and American rivers into this basin, and make them deposit therein the eands which they bring down. No objection is now seen to turning the American in this way. It is not navigable. The diversion could not fail to be beneficial to the Sacramento.

The Feather differs from the Sacramento in being a larger stream and consequently likely to be more expensive to divert and also in being navigable. It is now the outlet for a certain uistrict of country and maintains a small commerce.

It is recommended that a full investigation of tbis problem be made as soon as possible for future guidance.

Remedial Measures Indispensable.

The foregoing is an outline of tbe remedial measures that are possible. It is scarcely necesary to add, in view of what has been said, that eome measures are indispensable. The only alternative ie a cessation of hydraulic mining. Even if thie alternative were adopted it would still hc neccssary to restrain the many millione of cubic yards of detritus already mined, and now lying in the path of freshets which urgs it, year by year, into the lower line of drainage.

It is in a large part due to the courtesy of ths Stato Engineer of California, who has givsn access to data as yet nnpublished, that it has been peeeible to make thie report witb auy amount of definiteness, sither as to ths magnitude of the evil, or the cost and probability of success of remedial efforts.

The general features of this phenoiuenon of choked rivers havs been known for some tims, but no attsmpt has bsfore been made to assign a meaeure to these features. It must be regarded ae most unfortunats that thess msasures had not been taken ycare ago. Some definite conception of tho circumstances would then have been poseible, and ths evil could have beeu grappled with in good tims. The problem becomes more serioue by delay.

The statement of the case which has been giveu faile of ite object if it does not convey a most serious view of the urgency of the question. It is respectfully euggested that this question be brenght to the attention of Congrees as soon as practicable.

Reasens have been given why a full estimate of cost cannot now be made. A great part of the data has come from investigation outside of thie office. Our information must be admitted to be incomplete, but it is sufficient to justify a recommendation for an appropriation by Congress.

Appropriation Recommended.

It is, thereforo, respectfully recommended that an appropriation of $250,000 be asked of Congress, to be expended during the present year in the construction of storage reeervoire for mining detritus on the tributaries of the Sacramento river, and in a further study of this question. I am, very reepectfully, your obedient servant,

G. H. MENDELL,
Lieutenant-Colonel of Engineers.

Useful Information.

REPEATING MATCHES.—A patent has been taken out for a repeating match—that ie, a match that may be etruck a great many timee and yield a light each time. The match consists of two rods of inflammable composition placed side by side in two compartments with a suitable case. In order to etrike the light a ecraper is moved by hand along a platform across the open ends of the two rods. The scraper removes a certain quantity of its substance from each rod, and mixing these together the light is produced. One stick is composed of three parts chlorate of potash and one part of clay, thoroughly mixed, and formed into a thick paste by the addition of water, then dried. The other etick is made of three parts amorphous phosphorus and one part of clay prepared in the same mauner.

A NOVEL ELECTRIC LAMP.—An ingenious device, says the *Electrician*, has been invented for the use of smokers. It is an apparatus to obtain a light. It consiste of a small battery with a ehort piece of platinum in the circuit. Opposite the platinum is a nozzle from which a jet of gaseous benzoline is thrown. Between the nozzle and metal is a small cotton wick. On pressing a trigger the jet of benzeline is turned on, a "ehutter" in front of the platinum is opened, and the battery contact made. The metal becomes incandescent, the jet catches fire and inflames the wick, which continues to burn with a small flame until hlown out. Of course the wick is in a reservoir of oil like that of any other lamp. Cigars lighted by electricity will doubtless be a daily delight to the lovere of the fragrant weed.

COATING IRON WITH IRIDESCENT COPPER.—A writer in the Loudon *Mining Journal* thinks the invention of Dr. Weil, of Paris, for coating iron and eteel with copper or nickel in such a manner that the surfaces shall be iridescent, opene a large field for the employment of metal for decorative purposes. The ornamental iron castings made hoth in Great Britain and France are really beautiful in form and design, and hy the judicious coloration of them with comhinatione of iridescent brass and scarlet, brass and blue, or brass and green, would produce effects which would insure their general adoption.

A REMARKABLE ACCIDENT.—A remarkable accident occurred at the Vulcan Iron Works, Wilkesbarre, Penn. A couple of workmen were striking a har of hot steel with eledges, when a scale was thrown off, about as large as a three-cent piece, but not thicker than letter papsr. This scale struck the arm of one of the workmen just below the elbow, passed through the arm and came out above the elbow on the opposite side. It made a frightful wound. An artery was severed and the blood spurted in jets until pressure was applied to the artery above the place. A physician soon arrived and dressed the wound.

TO MAKE VULCANIZED RUBBER POROUS.—To give porosity to vulcanized rubber, a German process involves the additiou to the material, simultaneously with the sulphur, of 10% or more of wood cellulose; thc other properties remaining the eame.

A STEAM-TIGHT and water-tight cement for joints is eimply white lead and red lead in equal parts, mixed with linseed oil to the consistency required. The leade should be pure.

TO SILVER IVORY.—It is recommended to immerse it in a weak solution of chloride of silvsr (iu cyanide of potassium or hypo?), whsre it is to remain until it has acquired a deep yellow color. It is then removsd, dipped in water and exposed to sunlight until it has blackensd. By rubbing the blackensd surfacs it will acquira a silvery burnish.

Good Health.

Cause and Cure of Sea-sickness.

Much has been said and writtsn in rsgard to the cause and cure of esa-sickness; but as yet no very acesptahle theory has bsen given for the ons, ner any spscific for ths other. Dr. Henry Naylor, of Edinburg, Scotland, holds that it is ceused by a cerebral anæmia, which means a deficiency of blood circulation in the brain. He says:

"The rapid ewinging of the vessel, and tha body with it, irritates the eyes and vision, and thie, by reflex action, producee a spasm of tha cerebral capillarics; this explaine the feeling of faintness and giddiness that comes on suddenly just as the vessel givee a big swing. The sudden emptying of the cerebral vessels causes tha etomach to sympathize, resulting in efforts of vomiting, whether the etomach be full or empty. These symptoms are moet distressing when the eubject is in n etanding or sitting position, with the eyee opsn. If he lies down, the change of position relieves the anæmia, the faintnese and giddiness pass off, and the sickness ceases. But occasionally even a recumbent positiou does not give relief, if the eyes are kept open. When they are shut, the symptome are not felt in the least. I have known this to be the case with several ladies, who were never comfortable while at sea unless they wero lying down with their eyes closed. They were able to eat meals and retain them, if they laid down and closed their eyee immediately afterwards. In fact, I have been obliged to keep eome conetantly in bed to prevent their dying of starvation.

"A fact that helps to show tbe feasibility of the anæmic theory, is that brandy and other stimulants give considerable relief for a time, which would not be the case if cerebral congestion had to do with sea-eickness. The explanation of how sea-sickness continues so persistently in some, is that the sickness weakens the heart's action, and this keeps up the cerebral anæmia, and that in turn again produces the eickness; so that prolonged eea-sickness is due to a circuit of causes, the one producing the other—the visional irritation, cerebral anæmia, eickness, weak heart'e action."

Amyl nitrate uenally doee good in sea-sickneee, used at once, because, being an anti-spasmodic, it relievee the spasm of the cerebral vessels, and thus the brain is refilled with blood, but if it fails, then the persistent sickness, by ite effect on the contractions of the heart, prevents the hrain from getting a sufficient supply of blood, and thue the brain becomes anæmic, not from a spasm of the capillaries, but from an insufficient power of the heart. In thie case alcoholic stimulants in small doses, frequently repeated, are better.

Recreation.

The literal meaning of this word is to make over again; but in ite ordinary acceptation it is intended to convey the idea of rest, refreehment or rather, renovation. The body is refreshed by rest; the hrain is renovated by sleep, hy absolute repose. But both body and brain may be invigorated for a eeason, by changing the direction of their respective activities; and also by working alternately. A man who has hecome tired of riding on horseback or in a carriage, rests himself, gets rid of his fatigue, by walking. The brain which has become weary in thinking of one subject is refreehed hy taking up some other study. On the other hand, a man who feels tired all over, hy work, or a long walk, will "get rested" sooner by eitting down to read than if he did nothing. Rachel, the great tragic actress, when returning from one of her performances at two or three o'clock in the morning, rested herself hy spending an hour or two in changing the furniture of her rooms. The best sedative which a public epeaker can take after a great effort, is to read a newspaper, or anything else which has a variety of short statements.

The great practical idea we wish to convey is, that recreation is not idleness, hut a change of direction in the operation of the physical or mental forces. A French actress lately went mad within an hour after the play, because she went home, laid down and let the mind run on in the same track. She sbould have changed to bodily activity, like Rachel.—*Hall's Journal of Health.*

FRESH AIR.—Live out of doore ae much as you can. It is the place for a man to be. It is good for the health. A dietinguished physician was in the habit of eaying: "However bad the air may be out of doore, it ie always worse in the house." It is good for the temper. People who are always shut up in a house are apt to grow fretful and peevish. They are prone to acquire narrow views of things, and to worry over triale not worth considering. It ie good for the wbole character—for strength, hope, patience and fortitude. It expande and softens one'e nature and makee us more charitable.

The Week.

The northers which have prevailed for some time past, and by their arid influence were evaporating the moisture from the soil, have given place to a much needed rain, which has fallen just in time to be of especial benefit to the growing crops. It has rendered certain a prolific harvest, and hae given a healthier tone to business operations. The more cheerful feeling in mining circles arising from the expectations of a better time being near at hand, has also added to the buoyancy of the general public, and has aided largely to a restoration of confidence in financial quartere.

The hydraulic minere are beginning to grumble a little at the lateness of the spring freshets. Their harvest time commences when the water begins to "boom," and they are naturally anxioue for the spring to fairly open.

As will be noticed by the remarke in another column, it looks as if an era of strikee wae about being inaugurated in parts of the Eastern States, several having already been etarted. We notice that the *Coal Trade Journal* expect trouble in this direction from the coal miners.

If there has been any change at all in the business prospects in our immediate neighborhood, it has been for the better. Business has been for a long time extremely dull, and confidence is restored with difficnlty. With the great and boundless resources of a State so rich in material wealth as California, this etate of affaire cannot last much longer, and before many weeke are past we hope to eee plain evidences of a reaction.

J. M. LEARNED, of San Joaquin county, has sold his famous mare "Magdallah" to Charles Crocker. It is reported that the price paid wae $6,000.

THE Treaeurer of the Reading (Mass.) Savings Bank has been convicted upon 29 counts for embezzlement.

The Mining Laws.

Among the first eight sections of the mining bill before Congress, it is provided,

1. That the size of the claim shall be 1,500x600 feet.

2. That the locator shall not follow the dip of his ledge bsyond the point whsrs it is intersected by the surface boundary down vertically.

3. The locator shall be allowed one year after making ths location to discover minerals.

4. The locator within 90 days after making his location, must have his claim surveyed by a U. S. Deputy Surveyor, and a plan of the same must be filed with the Surveyor-Gsneral of the State or Territory.

We doubt vsry much whether the first and second sections will be approved by msn at all familiar with mining matters. The provisions will, if adopted, do more harm in one direction than good in another. The ostensible object is the prevention of litigation and conflict, but it may also prevent prospecting and dsvelopment.

This square location idea may do for such sections as Leadville, Colorado, and similar places where the ore lies in dsposits, and would no doubt work better there than the law now in force. In California, Nevada, Idaho, Montana, New Mexico, and Arizona, no such system of locations would answsr at all. The application is only local, and it would work harm except where deposits are the rule, and fissure veins the exception.

What company, for instance, will pnt up expensivs hoisting works, and other machinery to develop a mine, when the ledge pitches so much that it will run into some one elss's gronnd in 800 or 1,000 feet. In soms cases the ledge might run out of the company's location before the water level would be reached, where the ledge is expected to prove its worth. Such a law would bs fatal in any locality where thers was such a lods, as the Comstock, and there would be more litigation than thers is now. When the side lines were reached the company would have to stop, and ths labor all lost if no ors had been struck above, no matter what the prospects were ahead.

It is all nonsense to make a law applicable to Leadville alone, and the whole country. Even in Colorado this fact is recognized. A miners' indignation meeting, held at Salina last week, adopted resolutione expressive of satisfaction with the existing laws and condemning any change. They call the mining bill a "monstrous outrage." One of the resolutions reads as follows: "That said Land Commission, by recommending that claims on fissure veine be bounded by straight eurface lines, and that all right to mineral contained therein shall be confined to within vertical planes passing downwards through said boundary lines, argue themselves totally ignorant of the nature of fissure veins and the whole subject under consideration; consequently their recommendatious should carry no weight with Congress." A protest was entered againet any change whatever.

The bill as it etands now will be destructive to the mining interests, so far as prospectore and other poor men are concerned. The provision compelling the prospector to take a Deputy U. S. Surveyor to the ground within 90 days, is absurd, nonsensical, wholly uncalled for, uselese and burdensome.

Minere now are spreading ont into Arizona, New Mexico, the lower part of California, Nevada and other new regions. To take a eurveyor to some of these places would often involve a trip of several hundred miles and cost from $20 to $25 per day for the whole trip. Half the prospectore find it hard work to pay for grub, much less useless surveyore. The claim may be worth nothing at all. Ninety daye gives little time to prove its value. It puts miners to useless expense and loss of time. They are given a year to find mineral from which to get money, but only three monthe to find a deputy mineral eurveyor and the Surveyor-General's office, to pay out money.

Petitions or remonetrances shonld be gotten up in every camp and forwarded to our Senators to head off this bill. Meetinge of *practical miners* should be held and resolutions adopted, so that Congress will see before it is too late what harm is about to be done.

We have got a pretty good law now. We do not want any changes. Tinkering with the laws has become a fashionable amusement to a certain class; but the miners want no changes. They want to be let alone. The ideas of a dozen or two men, whose only interest is to gobble up all they can, ehould never be considered as representing those of the mining community at large. But eomething muet be done, and that quickly, to etop thie particular bill. Miners everywhere should meet and prepare remonstrances. If this bill passes as it etands, prospectors might as well throw away their picks and shovels and go to digging clams or planting potatoes.

MAP OF COMO.—We have received a map of the Como lode, Palmyra and Indian Spring dietricts, Lyon county, Nevada. It has been compiled from the latest authentic data by Wm. Rose, who has previously made eimilar maps of other districts. It ehows the town of Como, and the relative position of all the claime in the districts. Published by Payot, Upham & Co., of this city.

THE James single track railroad system was successfully tried this week at Antioch.

A Look Around and Ahead.

In common with the other countries on the Pacific slope California has for several months past been snffering from the inconveniences incident to a long and rigorons wintsr, the evils of which have, in our oass, been aggravated somewhat by a depressed condition of the labor market and other adventitious circumstances. The past has, in fact, been with ns an exceptionally hard winter, in both a meteorological and indnstrial senss. But our condition, thongh attendsd with some hardship, is not so very deplorable, certainly, by no means a desperate one, the prospect being that our affairs are likely soon to undsrgo a changs for the bstter. Never was the outlook for all our leading material intsrests better than at this moment. Our mining industries are in a healthy condition, while a prolific harvest of the cereal crops may bs considsred almost assnred. In the prospective abundant supply of watsr, our miners have the promiss of a prolonged and prospsrous working season, which, having already opened, will not, aftsr the long prevailing low temperature, bs likely to suffer further interruption from this causs. From our hydraulic mines it is agreed on all hands that a good account may this year be expected. In the field of vein mining thsre will also be more of that practical, telling sort of work done than ever before. If speculative opsrations shall suffer some diminution, thoss of a useful productive kind will bs incressed, and we think we hazard little in predicting for California a year of general progress and prospsrity.

Not only so, but, for our near neighbors, it strikes ns there is in reserve a like period of thrift and advancement. Many of the mines of Arizona, more especially thoss in the southerly part of the Territory, ars developing into grand proportions, the ownsrs of some single properties there having absolutely rsjected an offer of a million dollars for them, and, in some instances, as much as a million and a half, if reports be trus. Eastern capital is being strongly attracted toward that eection of country, and probably not without good reason.

In Nevada, hundreds of claims that have long lain dormant, or been but little explored, for want of capital to open them up, will this year be resurrected into new life; the owners, tired of importuning others to help them, taking hold and developing them with their own labor.

From Utah, well authenticated accounts reach us of a great gold find in Bingham Canyon, an old mining locality, lying some 30 miles southwest of Salt Lake City. These are the first gold quartz mines ever found in that Territory, where the discovery—both on account of its magnitude and novelty—has awakened a lively interest and already attracted the notice of the Eastern money magnates, some of whom have invested largely, through agents eent out for the purpose. Utah, through her central position and the character of her ore deposits, occnpies a vantage gronnd largely peculiar to herself. In the heart of the Territory centers a great railroad system, facilitating intercourse with both the Pacific and the Atlantic sides of the Continent. Her mining population are, therefore, in a more favorable situation for receiving monied assietance from outside eources than are the residents of any other country west of the Rooky mountains—it being the case, at the same time, that they require such assistance less, perhaps, than any other. The prevailing oree in Utah are those adapted for smelting pnrposes. These are generally of easy extraction, and the miner, having gotten out a lot of ore, large or small, can at once get the cash for it at the smelters, of which there are alwaye some convenient to the principal mining districts. As the California placer miner can readily convert his gold dust into coin, so can the Utah silver miner make euch conversion of hie ores as soon as he gets them out of the gronnd.

Colorado, Idaho and Montana will each abound with lively mining camps the coming summer, Leadville and the Gunnison country promising to be in Colorado the central points of attraction, while the Carribou and the Salmon river mines will have the call in Idaho, and the Butte district in Montana. Aside from these centers of special interest, mining for the precious metale will be generally active in these eeveral countries, where this industry has now become wide-epread and firmly planted.

As for California, her industrial condition, as marked at the outset, is not only hopeful, bnt in every way enconraging, the accounts of our industrial depression and eocial disorder, as published by the Eastern press, having been grossly exaggerated. For a season times here have been a little dull and thinge looked somewhat gloomy, but the clonds are lifting all around the horizon, and the day epring of a better era eeems to be at hand. Under the bsneficent influences of milder weather and a growing spirit of conciliation, business will revive, conflicting interests be harmonized and hard feelings allayed, insuring general prosperity and abiding peace. Let the Eastern people and the Eastern press forbear their sad vaticinations, nor waste more of their dolorous eympathy on California.

THE Oroville *Mercury* eaye that the Chinamen who are working mines in the lava bed district are making a good deal of money, ehipping $15,000 per week.

Central Plumas.

Owing to the snow blockade that has for ssveral months past impeded intsrcourse between the central portions of Plumas county and the outside world, we have not in the interior heard much about mining operations in that locality. Through a rsliable sonrce of information we lsarn, howsver, that work there has been kept up pretty steadily on many of tho quartz and drift claims, despite the deep snow and long-continued cold weather.

Thsre ars thirtssn qnartz mills in this part of Plumas, carrying a total of about 200 stamps, of which nearly one-half are rnnning, viz: The Plumas National, the Gresn Mountain, the Gold Strips, carrying 20 stamps each, and the New York, the Soda Cresk and the Genesee, 10 stamps each. The Crescent mill and the Union, each 24 stamps, the Indian Valley 20 stamps, the Kettle 15, and the Monitor and the Wisconsin, sach 10, are not running, some of them because the water they depend on for their propulsive power is frozen up, and others for the reason that they have no ore on hand. The ore body in the Crsscent mine, on which the company's mill had been running successfully for a great many years, having lately givsn out, new hoisting works havs been erected with a view to exploring for another ore body known to exist at the point whsre sinking is going on. Ssveral other of thsss companies ars also searching aftsr deposits of ore, or developing those already found, the prospect bsing that most of the idle mills will bs started up in ths courss of a fsw weeks, with fair stocks of ore.

Two or three Eastsrn companies, owning mines hsre, ars running thsir mills and driving work ahead with spirit, and, although their properties are not what may bs styled big, they promise, under their present snsrgstic management, to prove paying institutions.

There are a number of excsllsnt drift claims in that section of country, some of which have besn worked all wintsr, while, on others, work will soon be commenced. Among ths lattsr is the Meeker property, on the north fork of the Feather river, which hae been well opened and outfitted and will this spring be operated both as a hydraulic and drift claim. Beyond the neighborhood we are speaking of there are no mining operatione in progress and, in fact, no mines in this district lying at the northern extremity of the Sierra Nevada or main California gold belt. The gold field that covers so much of Shasta, Trinity and other oceanward-lying counties, is eituated further west in the outspreading Coast range mountains, and is separated from the Sierra Nevada by the Sacramento valley and the Shasta plaine lying at its head.

Foundry Notes.

There was completed this week at the National Iron Works, a pair of 18x72 engines for a etern-wheel steamer which is to ply on Fraser river. She will be particularly employed in carrying railroad iron and tiee for the Canada Southern railroad. The steamer is now in process of construction and will be 163 feet long, 30 feet beam and four feet depth of hold. Her wheel is 18 feet 6 inchee in diameter and has 15 arms, with buckets 20 feet 10 inches. The boiler is 64 inches by 31 feet 6 inches, and has a tubular heater 10 feet long.

The enginee weigh, including the shaft and wheel irons, about 20 tons, and their combined power is abont 500-horse power. They are made with all the latest improvements as etern wheel practice allows. They are provided with Crose' patent cut-off, poppet valves, etc. The lifters for moving the levere are of new form, and the throttle valve ie a poppet throttle, balanced. The pitman rods are 30 feet long between centers. The cranks are wrought iron, and the wheel shaft, 25 feet long, ie of hammered iron, nine inches in diameter. The engines are very strongly and neatly built, and form quite a creditable job. It was intended at first to have them made in the East, but when the freight from the East was conoidered, they were more cheaply built here.

The eteamer in which the machinery is to be placed is of somewhat different ehape from those in use on our rivers. The drawings ehow her to be much narrower aft than is usual with us, and also somewhat sharper forward. She ie being built for Capt. John Irving.

RICH ORE.—Eight tons of ore from the Alley mine, Ivanpah, reduced at the Hofmann & Mendheim works, has netted $8,500. The mill of the Ivanpah Con. mine, after undergoing extensive repairs, started up on the 1st inst. It is annonnced that after the first bullion shipment, the Ivanpah Con. stock will be lieted on the board.

SKAGIT MINES.—From reliable news received from the Skagit mines, we learn that the depth of snow in and around Ruby creek is eight feet, which will probably prevent any work from being done before the 1st of June, or later. It is not advisable therefore to etart for Skagit just now.

THE Atlantic and Great Western Railroad Company hae been metamorphosed into the New York, Pennsylvania and Ohio Railway Company.

Mining Reforms.

Some of the Eastern mining companies are demanding bonds from the presidents and secretaries for the faithful discharge of their duties. There is no good reason why this should not be done in all cases; more especially in those cases where the stock and business transactions become very important, and where the facilities for malfeasance and the temptations to fraud are consequently great. It would give additional confidence to those who were inclined to invest in mining, as it would evince a security that does not now exist. There would be something to fall back upon in case of error purposely committed, and where, without these bonds, nothing could be obtained by the losers. It generally proves to be the case, when a defalcation in the funds occurs, or an over-issue of stock transpires, that the guilty one has nothing which can be applied to the liquidation of the deficit. He is usually irresponsible, financially; his expenditures—in extravagant living or in speculations—have absorbed all of his stealings, and his assets are vaporous and intangible.

It is impossible to guard against dereliction in officials in mining or other corporations, where the determination to steal exists. But a greater safeguard would be placed over the actions of those who are prone to error if a very rigid scrutiny was at all times instigated over their official acts, and extended to a just surveillance over their private career. "An honest man is not afraid of being watched; a rogue needs to be," is a truthful adage. While it might be somewhat annoying to a sensitive person to be aware that he was under a continued scrutiny, still he would, so long as innocent, possess a fearlessness, from his conscious rectitude, that a knave could never enjoy. But it is a duty that the companies owe to those who invest in them to see that no misappropriation of their funds is made. The investors cannot have the opportunity of auditing all accounts, or of following the issuance or transfer of the shares of stock. They have their own individual matters to attend to, and cannot supervise the details of the company's transactions. They must trust their interests to the board of directors, and they expect them to be faithful. If the bonds were required from the directors as well, perhaps they would keep a better watch over the actions of the presiding officer and secretary. It is a good move, and in the right direction, and it is to be hoped that it will become so general among mining companies that it will be considered as a matter of course that such bonds must in all cases be executed.

The Eastern companies have also reduced all salaries 50%. In many cases this is a desirable movement on the score of economy and business-like reduction of expenditure. Where the salaries have been far above the value of the services rendered, it is well to reduce them to the basis of a just recompense for acts performed. But to make an indiscriminate reduction would be injudicious. It would, in some cases, be adverse to the interests of the mine; because, where a superintendent had been receiving only the amount he was justly entitled to—when his ability and knowledge of his profession were taken into account—if his rightful salary was reduced one-half, he would undoubtedly resign, and, at that price, the company could not obtain any but an inefficient man for that position, and the interests of the mine would be jeopardized thereby.

The mooting of reduction in expenses in mining affairs is certain to operate advantageously for the general welfare of the mines. The same close attention to economy in the management of them is as necessary to be inculcated and practiced as it would be in any other business. There has been too much recklessness in mining outgoes for expense account. It has been a leading cause in the failure of so many mines; and it is to the attention turned in this direction that mining has advanced so rapidly within the past very few years.

Strikes in the East.

With the advent of "good times" in the Eastern States and increase of business, comes news of strikes and impending strikes. Among the iron workers this has been expected some time. In that business for several months they have been behind with orders, having more than they could properly attend to. This is in all the different classes of iron working, hardware, etc. Some of these are two or three months behind with orders, which continue to accumulate.

We see by a dispatch on the 15th from Harrisburg that the puddlers are on a strike for $6 a ton. Mill-owners offer $5.50. The puddlers of Reading demand an increase to $6 from $4.50 per ton.

At Buffalo the puddlers and rollers of the Union Iron Works, receiving $5.50 per ton, struck for $6.25. An extra police force is on duty at the works.

At New York the lockout of men in piano factories began on Monday. Those in forced idleness voted to demand 15% increase of wages before returning to work.

At Chicago about 400 furniture frame-makers make a demand on Monday morning for an advance of 15% in their wages, and on refusal, they struck. They claim that many hundreds more will shortly join them, while the furniture-makers express confidence that the strikers have no backbone.

At St. Louis all the mechanics of the Missouri Pacific Railroad machine shops in the western part of the city, numbering about 400, struck on the 16th for 10% advance in wages.

Eloquence of Labor.

Eloquence to be effectual must be impressive. It must, to awaken sympathy, possess magnetic influence combined with essential verities. It must, while appealing to thought, be able to arouse impulse. It must be based upon facts and be instigated by the necessity of the occasion. These are the leading qualifications to make eloquence productive of the desired results. Its minor features are but subdivisions of its above enumerated concomitants. All these requisites, and even more, are possessed and continually practiced by labor.

It is impressive because it shows the results of its efforts. It speaks in a language that cannot be misunderstood, of the benefits which it is ever and always competent to obtain. It shows that its acts are causes which conduce to the accomplishments of its desires and its designs.

In appealing to sympathy with its unmistakable truths, it points to its ntile creations and to its additions to the wealth and the welfare of nations, and awakens the desire to emulate its examples in so meritorious a cause. It shews how the world is made productive and its barren places caused to become fruitful. It tells of the banishment of sterility from the soil and the installation of a prolific epoch in its stead. It arouses the energy of the agriculturist and nerves him to more strenuous exertions to derive increased yields from the land. It incites the artisan to the creation of new mechanical devices through whose assistance widely extended manufactures are disseminated.

It engenders impulse by its bold and vigorous instances of successful manipulations, and appeals to the investigating and thoughtful mind by its array of incontrovertible facts regarding the benefits it is able to confer upon mankind.

Its eloquence never ceases; from the rising of the sun to the going down thereof, its utterances are continued with all their convincing arguments. Its language never descends from sublimity of conception, or falls to the vain, frivolous or futile. It adapts itself to the comprehension of the unlettered, and fascinates the scholastic with the purity of its diction. It holds out no wild inducements, it utters no falsehoods, it speaks only of well-proven truths. It asserts no false dogmas, it deals not in sophistry and it abhors prevarication. It breathes no insinuations, but it ever gives voice to decided and plain assertions.

Its most potent arguments are uttered in its moments of most earnest toil. While striving to its utmost tension it is most convincing. Its proofs are omnipresent, self-evident and irrefutable. It recognizes facts and ignores postulation. Its voice rises whenever the sound of labor breaks upon the stillness of the air, and while toil continues it never relapses into silence. Each deep-drawn breath of the worker is its intonation of argument, while the result of his exertion is its correlative proof. Its eloquence is generated in the narrow apartment of the half-famished seamstress by the faint tone of the cloth-piercing needle, as well as in the rushing sound of the most remote and extensive sun in the stellar universe. It finds its audibility in the silent brain thought of the inventor, through whose telephonic power it causes itself to be heard by the people of nations.

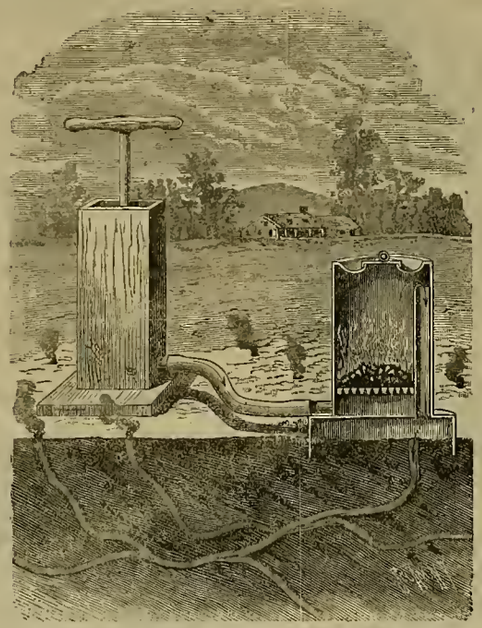
It is god-like in its power, for it is omnipotent in its persuasiveness; equally so in its verity, for truth is its solid basis. Since the incipiency of creation it has never been silent. Its tones pervaded space with their harmony ere man came into existence, for it gave voice to the stars when they sang together their rhythmic hymn of joy and adulation. And now that man does exist, it exerts itself for the promotion of his welfare, and all its utterings are for the advancement of his prosperity and to his benefit if he will but heed purport of them.

Academy of Sciences.

The semi-monthly meeting of the California Academy of Sciences was held on Monday evening, Prof. Davidson in the chair. Messrs. W. F. Buswell, A. Roman and W. F. McAllister were elected resident members.

Donations to the museum were as follows: From E. E. Hewitt, of Los Angeles, through B. B. Redding, Indian pottery, foot-ball and basket, from Pimo and Maricopa Indians; stone-hammer, head of war club and stone implements from Casa Grande, Arizona. From George Dutton, a fossil oyster, *Ostrea Titan*, found on Santa Lucia mountains, Monterey county, California. From Elisha Brooks, ten aquatic birds. From Spence & Johnson, three *Pandalus* and one *Octopus*. From Henry Chapman, skull of an African lion, who was 27 years in Montgomery Queen's circus. From Andrew Garrett, 70 species of Society Island ferns.

Dr. Eugene Dupuy delivered a lecture on the subject of hereditary transmission of lesions of nutrition. Dr. Dupuy has been the collaborator of Dr. Brown-Sequard, the eminent experimental scientist, in experiments having for their direct object the ascertainment of the transmissibility in generation of lesions of nutrition. The Doctor said that, for many purposes—among them being that of deciding the inheritability of injuries to the nerves—experimentation is better than discerning. The particular lesion, the transmissibility of which to offspring it is desired to test, can be inflicted on one of the lower animals. For various patent reasons, a specified nerve or a predetermined lobe of brain can be more conveniently crippled or destroyed in guinea pigs, cats, dogs and pigeons, than in humans. The lecturer and Dr. Brown-Sequard experimented on all the first four classes of animals, but most numerously on the guinea pig, for several excellences for the purpose possessed by the latter, the chief among which is its capacity for the innumerable multiplication of itself into swiftly succeeding generations. The guinea pig has three toes. It was found that by injuring, without destroying the nerve of these toes by either one of the gentle processes of dividing, tearing or burning it, the pig lost the use of two of its toes; that the pig, with some instinctive idea of economy, then bit the useless toes off, and that it was subsequently afflicted with nervous twitchings, increasing to convulsions, with foaming at the mouth and all the other symptoms of epilepsy in humans. Other ingenious ways of injuring other nerves or removing portions of brain were practised with equally pleasing results. The progeny of these parents were born with only the one toe that had remained uninjured in the ancestor, and as they grew, all the symptoms that had appeared in the ancestor after the lesion, appeared also in them. The guinea pig, being more plastic than the human, frequently recovers entirely from these lesions. The lecturer had the seventh generation of animals of an ancestor upon which a lesion had been made, and even the bone structure of the head was so different from that of normal specimens that, if their bodies were concealed, they could not be told from their heads to be guinea pigs. Experiments were made with equal success on animals of other species, but the results had not been so accurately ascertained, because, as a general thing, the animals died. The lecturer had known a lady in England, two of the fingers of one of whose hands had been disabled by machinery accidentally, and in such a way that the nerves had been injured. A daughter subsequently born to her was born similarly disabled. A gentleman and his wife, living in New York, had each had their right hand disabled, and was compelled to do all manual acts with the left. Their five daughters—a son and a grandson—each, involuntarily, did also with the left hand whatever was being done by the right. The doctor thought California, with all its other undisputed charms, to be also a delightful place for the study of the transmissibility of the lesions of nutrition, because accidents in the mines are so numerous.



MELCHER'S SQUIRREL AND GOPHER EXTERMINATOR.

Legislative Matters.

The Revenue bill, passed finally last week, has not, at present writing, been signed by the Governor, and is still being vigorously discussed, pro and con, in hopes of influencing his Excellency.

The Assembly passed the bill fixing the hours of labor of drivers and conductors of street cars at 12 hours.

The famous Gorley mining bill was finally defeated in the Senate, much to the relief of all brokers.

The substitute bill by Hittell, for removing officers of mining corporations by the shareholders thereof, has been read a second time and ordered to engrossment.

Streeter has introduced a bill providing for the continuation of the irrigation investigation by the State Engineer, and appropriating $30,000 therefor.

The question of riparian rights is exciting a great deal of attention. The Senate has already passed a bill declaring that they only apply to water for domestic purposes and the watering of stock, and Assemblyman Sayle, of Fresno, introduced a bill adding a section to the Civil Code, abolishing them altogether. The bill is as follows:

"The rights of riparian owners and prospectors, as defined and enumerated by the common law doctrine, is hereby abrogated and declared not to exist in this State, provided that the provisions of this act shall not in any manner be construed to affect the vested rights of riparian owners already existing prior to the passage of this act."

Brown's bill provides for an irrigation and debris system supplemental to the State Engineer act of last session.

There are still a great number of bills to be considered by the Legislature, and the rest of the session will be devoted to hard work in clearing them off.

Gopher and Ground Squirrel Destroyer.

We give on this page an illustration of a gopher and squirrel destroying apparatus devised by an ingenious Texan inventor. The arrangement and operation are both simple and could almost be learned from the engraving alone. It may, however, be said in explanation that the invention consists in a fire chamber, having around the bottom a sharp flange which cuts into the ground around the gopher or squirrel hole, forming a tight joint. The fire chamber has an air space under the grate, which communicates with the air-forcing pump through a short section of flexible tube. An internal pipe extends from the bottom of the fire chamber upward to convey the poisonous fumes from the top of the chamber down into the chamber formed by the flange.

A fire having been made in the fire chamber, a sulphurous compound is dropped in upon it, and the opening in the top of the chamber is closed. The air-forcing machine being started, all of the smoke and poisonous vapors are forced down into the hole, killing everything animate with which it comes into contact.

The air-pumps are made of the very best and well-seasoned lumber, 11x11 and 34 inches high, with valves and piston, working very light and true, making 30 strokes per minute at ordinary working. At each stroke 2 cubic feet of air is forced into the hole, sufficient to fill a two-inch squirrel hole nearly 2,000 feet long in one minute, if no smoke or wind escapes.

This device has been used quite largely in Texas during the last year, both in suffocating gophers and in destroying the cutting ant which infests some parts of that State. It was awarded a diploma at the Texas State fair October 28, 1879. The inventor is J. C. Melcher, Black Jack Springs, Fayette county, Texas, from whom any farther particulars concerning the apparatus and its working can be obtained.

THE suit of the Justice mining company vs. Schultz & Von Bargen has been decided in favor of the defendants on the ground that they extinguished their obligations, if any, by an accordant satisfaction.

A Thriving Northern Town.

In a petition addressed to the Legislature for a branch Normal school at Reading, Shasta county, we find the following claims of the advantages of that growing town and prosperous region: The town of Reading, in the county of Shasta, is located at the terminus of the California and Oregon railroad, 169 miles north of Sacramento city, and 150 miles south of the Oregon line. Its business patronage comes from those residing in a circle, reaching from Chewaukan valley, Oregon, to Hay Fork, Trinity county, California, and extending through Modoc, Siskiyou, Trinity and Shasta counties, California, Lake, Jackson and Douglas counties, Oregon, and reaching back as far as 250 miles from the town. Travel to and from the town is accommodated by the California and Oregon railroad to and from the south daily; and by three daily lines of stages, one tri-weekly and one daily express to other parts of the country.

It is more healthy than the average California towns, because it is situated on high table lands beyond the reach of miasmatic influences, and yet it is below the snow line; although snow falls here it seldom remains more than twenty-four hours. The water is most plentiful and pure, the soil most productive. Fruit of all kinds is raised in abundance, as well as the orange, while the most tender shrubs and plants thrive luxuriantly in the open air. The scenery is grand and beautiful beyond description, embracing in its range the heaven-towering and ever snow-capped Mount Shasta, Mount Lassen and many other snow-covered peaks, together with the termination of the Sacramento valley.

Business Directory.

WM. BARTLING. HENRY KIMBALL

Quartz, Turquois and other Stones cut and set. Watches and Jewelry repaired by skillful workmen.

NOW READY!

OF IMMENSE PRACTICAL VALUE TO EVERY SAW USER.

GRIMSHAW on SAWS!

History, Development and Action; Classification and Comparison; Manufacture, Care and Use of SAWS of all kinds. Quarto. 234 Illustrations.

By ROBERT GRIMSHAW, Ph. D., M. E.,

Member of the Jury on Wood-working Machinery at Paris Exposition of 1878.

This thorough work, impartially written in a clear, simple and practical style, treats the Saw scientifically, analyzing its action and work, and describing, under the leading classes of Reciprocating and Continuous Acting Saws, the various kinds of large and small hand, sash, Muley, jig, drag, circular, cylinder and hand Saws, as now and formerly used for crosscutting, ripping, scroll-cutting, and all other sawing operations in wood, stone and metal, ice, ivory, etc., in this country and abroad. With appendices concerning the details of manufacture, setting, swaging, gumming, filing, etc., tables of gauges, log measurements from 10 to 24 feet, and from 12 to 96 inches, lists of all U. S. Patents on Saws from 1790 to 1880, and other valuable information. Elegantly printed on extra heavy paper, wide margin, copiously indexed.

Owing to an increase of nearly 100% in number of pages and illustrations since first projected, the price is this date made $2.50, postage paid

ROBERT GRIMSHAW,

624, 626 and 628 Market Street, Philadelphia.

March 10, 1880.

Mines and Works of Almaden.

Translated from "Annales des Mines"

By S. B. CHRISTY.

Full geological description of this famous Quicksilver Mine, illustrated by maps and plans of the works. Completes description of the Quicksilver Furnaces and Condensers, etc. 48 pages octavo—paper cover—price (postpaid) 50 Cts. Published and sold by DEWEY & CO., 202 Sansome Street, S. F.

SHEET IRON PIPE.

FRANCIS SMITH & CO.,

Manufacturers of

THE PATENT CHANNEL IRON WHEELBARROWS.

THE STRONGEST BARROW MADE. These Barrows are made by Superior Workmen, and of the best material. All sizes kept constantly on hand.

SHEET IRON PIPE.

Lap-Welded Pipe, all Sizes, from Three to Six Inches. Artesian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.

Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.

Office and Manufactory, 130 Beale Street, San Francisco.

SHEET IRON PIPE.

Sanderson Bros. & Co.'s

BEST REFINED CAST-STEEL.

WARRANTED MOST SUPERIOR FOR DRILLS, HAMMERS, ETC.

A full and complete stock of this reliable and well-known brand of Steel, for mining and other uses, now in stock, and for sale at

21 and 23 Fremont Street, S. F., - H. D. Morris, Agent.

Dixon's Graphite Axle Grease.

Will neither run nor gum. It will last three times as long as any other grease. It is the BEST LUBRICATOR for all MILL MACHINERY.

It is extensively used in this city, being the cheapest and the best. ☞Try it, and you will use no other.

WARREN HOLT, Sole Agent for this Coast,

No. 717 Montgomery Street, San Francisco.

STEEL CASTINGS

FROM 1-4 TO 10,000 lbs. WEIGHT.

True to pattern, sound and solid, of unequaled strength, toughness and durability.

An Invaluable substitute for forgings or cast-iron requiring three-fold strength.

Gearing of all kinds, Shoes, Dies, Hammerheads, Crossheads for Locomotives, etc.

12,000 Crank Shafts of this Steel now running proved superior to wrought iron.

CRANK SHAFTS, CROSSHEADS and GEARING, specialties.

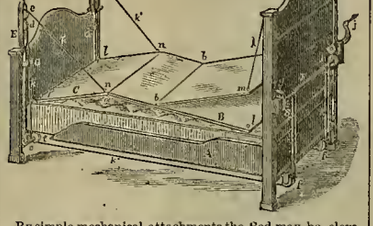
The Archer Patent Invalid Bed.



By simple mechanical attachments the Bed may be elevated, tilted, or adjusted to accommodate the invalid.

For full particulars see MINING AND SCIENTIFIC PRESS December 27th, 1879.

The adjustable bed bottom is put on top of the mattress, and by means of noiselessly operating cords and pulleys the patient may be put in any desired position.

The bed is adapted for persons in good health who wish an easy position, as well as it is for invalids.

This bed is of the latest improved form, with a view to simplicity, convenience and ease to the occupant.

A limited number of State and County Rights for sale.

Orders for the Patent Bed can be filled immediately.

Satisfaction will be given to those desiring to interest themselves in the manufacture or sale of this article.

JAMES H. ARCHER,

Madison, Yolo County, Cal.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

Kendall's Spavin Cure

Is a sure cure for spavin, splint, curb, callous, sprains, swellings, galls, lameness and all enlargements of the joints or limbs. It will completely remove a bone spavin without blistering or causing a sore. It is also as good for man as for beast, and is used full strength at all times of the year with perfect safety. A cure which we are knowing to is a person who suffered 15 years with hip-joint lameness and was permanently cured two years ago with Kendall's Spavin Cure. Remember we claim it will cure a bone spavin and completely remove the hunch without blistering.

Office U. S. Marshal, Western Dist. of Michigan, Kalamazoo, April 15th, 1879.

B. J. Kendall, Enosburgh Falls, Vt.—DEAR SIR:—I received the two bottles of your spavin cure forwarded by express in January last. I am happy to state that it performed all your advertisement called for. In three weeks after I commenced using it the spavin was entirely removed and a valuable horse restored to usefulness. Very truly yours, JOHN PARKER.

Send for illustrated circular giving positive proof. Price, $1 All Druggists have it or can get it for you.

Also, to our large and well adapted stock of

Assayers' Materials & Chemical Apparatus,

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast.
Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application.

JOHN TAYLOR & CO.

W. BRUCKNER'S
ROASTING FURNACE
AND
Ore Pulverizers.

(Awarded the Premium Gold Medal at Naples, Italy.)

The furnace is especially adapted for roasting rebellious ores; there are more than fifty in use in Colorado, giving perfect satisfaction.
The Ore Pulverizer is built in different sizes. It is preferable to Stamp Mills because it requires less power and less repairs than Stamps. No extra expense for setting up, and no foundation. Less weight and less cost than stamps.
Furnished also in sections for packing.

Ingersoll Rock Drills.

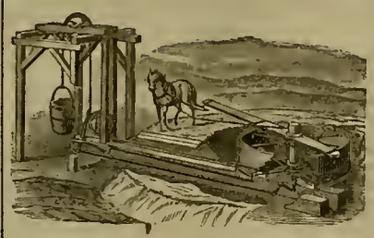
In use in the largest and best Mines of the Coast.

HAS AUTOMATIC FEED.

Has less Repairs.

Is Lighter and more Easily Adjusted than any other Drill.

Our DRY AIR COMPRESSORS are the most Economical Compressors in the Market.



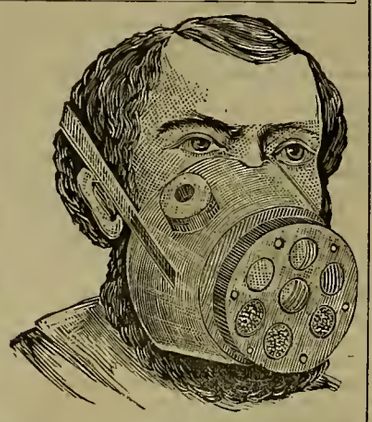
MINERS' HORSE-POWER.

This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.
The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing

REYNOLDS & RIX, 49 Fremont Street, San Francisco.

PATENT
LIFE-SAVING RESPIRATOR

Prevents Lead Poisoning and Salivation.



INVALUABLE to those engaged in Dry Crushing Quartz Mills, Quicksilver Mines, Guano Works, White Lead Corroding, Feeding Threshing Machines and all occupations where the surrounding atmosphere is filled with dust, obnoxious smells or poisonous vapors. The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, $3 each, or $30 per dozen. Sent post-paid to any address upon receipt of price.

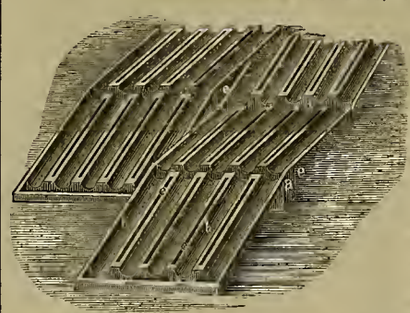
Howland's Under-current, Mill and Sluice Riffle.



This invention meets a want which has long been felt by Gravel Miners and Millmen, viz.: that of a simple, cheap Riffle which will save the largest possible amount of gold or sulphurets, with the least possible waste of quicksilver. That this Riffle answers all these conditions will be apparent to any practical man who takes the trouble to examine it. The arrangement of this Riffle is such that there is a strong, unobstructed upper-current to carry off and break up the gravel or cement, and a slow under-current, checked by numerous riffles, which give gold or sulphurets a better opportunity of settling than if they were exposed to the force of the main current.

In this Riffle there are cast troughs for the quicksilver, which extend entirely across the sluice, and while they are so placed that the current will naturally pitch towards them, and give every opportunity for amalgamation, the quicksilver is fully protected from flouring or leakage. There is no mechanical skill required in taking out or replacing the sections.

Full particulars in regard to this invention can be obtained by applying to

STEIGER & KERR, of the Occidental Foundry, 137 First St., S. F.,

Who have the sole right of manufacturing this Riffle, and who will receive and attend to all orders.

GEO. S. LADD, President. ANDREW WHITE, Secretary.

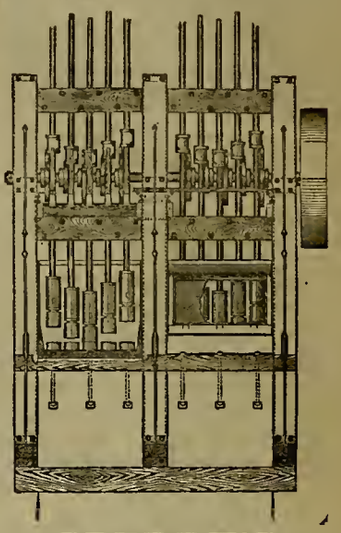
GOLD AND SILVER
Grinding and Amalgamating
MACHINERY.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies.



SPERRY'S
Wrought-Iron Frame
FOR STAMP MILLS.

Great saving in time and money over the wood frame. Is made complete with wrought-iron frame ready to put upon the foundation, requiring no skilled millwright. These mills are unsurpassed in excellence in every particular.
We are furnishing all the Machinery for a 10-Stamp Gold Mill, including Crucible, Steel Shoes and Dies, Boiler and Engine, Counter Shafting, Pulleys, etc., Stamps weighing 450 lbs. each, with Copper Plate inside of the Mortars, and for tables outside, making all the Machinery complete for a 10-Stamp Mill for the sum of

$2,550.

We construct Mills with Stamps weighing from 350 to 900 lbs. for gold or Silver Ores. Wet or dry Crushing Mortars. Will contract to erect complete Gold and Silver Mills on the most improved plans. We have 30 years' experience in mining and milling Gold and Silver Ores, and can compete with the world. Send for a circular. Address

A Card from Architects.

The California Architect and Building Review.

Office, No. 240 Montgomery Street, San Francisco, Cal.

It is with pleasure that we publish the following from prominent Architects in this city:
Believing that a journal of its kind is a necessity on this coast, and judging from what has appeared in the "Quarterly Architectural Review," we are led to believe that the CALIFORNIA ARCHITECT AND BUILDING REVIEW will be worthy of generous support and encouragement. We therefore pledge our cordial sympathies, personally, and hope that the enterprise will receive kindly recognition and liberal support from all Architects and Builders and the public generally. (Signed) David Farquharson, Wright & Sanders, S. H. Williams, Thos. J. Welsh, P. Huerne, John Marquis, B. McDougal & Son, Wm. Mooser, Wm. Curlett, Meeker & Banks, W. O. Hoagland, S. & J. Newsom, B. Henrickson.

How to Stop this Paper.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by *letter.*

CONTINUED FROM PAGE 181.

length of the claim the ore crops out and assaye as bigh as $1,960 have been made, and averages of about $200 shown from a large number of assays. The ledge shows six and seven ft only in prospect shafts. One shaft is down nearly 22 ft. At a depth of 50 ft they will crosscut to demonstrate the width of the vein. A person can walk on the croppings lengthwise of the claim 1,200 to 1,300 ft.

TOMBSTONE ITEMS.—Cor. *Arizona Star*: The Grand Central is now raising from its lower level some of the richest ore ever found in the mine, and the rich ore is enlarging. It is over 17 ft in width, and looks as if it was the bonanza of this camp. A rich strike has been made at the east side of the Dragoon mountains, near the Turquois country. Silver glance is seen in the ore. Also, at the south end of the Dragoons, some recent discoveries are looking more than well. The veins are strong and wide, and free gold can be seen even in the croppings. Also, above Cachise pass another new find has been made, that at a depth of five ft has an eight-ft vein of fine looking ore. The Jersey Blue, in the Dragoons, has a four-ft vein with rich sulphurets of silver ore. It is in the foothills on the east side. On the Red Jacket and Young America claims, near town, a quartz vein has been struck that has free gold in specks. The Minerva mine has four shafts on the line of the vein all in ore. It is a true vein all in granite.

TUSCAMBIA.—Prescott *Miner*, Mar. 5: Has a tunnel 275 ft in length following the ledge all in ore. There are two shafts, one of 110 ft and one of 90 ft in depth on the ledge which expose the ore body for a distance of 800 ft. Three tons of ore from this mine milled at the Peck mill, yielded $981 per ton.

SILVER PRINCE.—A new discovery has been made within three ft of the old workings. The ore vein discovered crops out for 60 ft, is 10 inches wide, and has chlorides in with the grass roots. Average samples taken from this vein go from $800 to $1,300 per ton.

OROOM CREEK.—George E. Berry recently discovered, on Groom creek, a gold-bearing ledge which shows a body of rich ore from four to five ft wide within a few inches of the surface. The rock is somewhat decomposed, and from prospects made from the surface dirt indicates that it will pay well. The Parker mine has recently been opened by a 160-ft tunnel and a fine body of ore developed. A. J. Rupert recently opened up, near the Benjamin, a claim discovered by him. The pay streak is 28 inches wide, and prospects well in free gold.

TONTO BASIN.—Reports from Tonto Basin show a great deal of activity in mining matters and some rich strikes. In Sam Hill's Zulu mine the shaft is down 50 ft, and the ore is apparently of equally good quality with that found near the surface, assays from which gave $180 per ton. The ledge is of unknown width at the depth reached, as the vein has not yet been cut across. It is estimated at from 12 to 14 ft.

COLORADO.

GREAT REPUBLIC.—Georgetown *Miner*, Mar. 11: This lode is situated on Revenue mountain in Geneva mining district. It has two tunnels and a shaft. The upper tunnel is 50 ft in length, and has in the breast a four-ft vein of quartz assaying 107 ounces silver per ton. The ore carries galena, copper, bismuth and a little gold. About 650 ft down the mountain is tunnel No. 2. Here they have drifted some 50 ft, but as yet have not gotten through the slide. The shaft is 700 ft above the upper tunnel and is but 10 ft deep, but shows the same character of ore as exists in the lower workings.

LUCKY HESPERUS.—A rich strike has been made. They are stoping above the tunnel level on a good body of rich ore. From a recent mill run of 4,700 pounds the returns are as follows: 1st class, 1,048; 2d class, 495; 3d class, 211 nunces silver per ton.

MAGNET & SEQUEL.—The upper adit is in 375 ft and the lower one 250 ft. A large amount of stoping has been done over them with good results, the ore milling from 100 to 300 ounces.

LEBANON.—There are from 1 to 10 inches of pay in the different stopes, and from two to six inches of solid ore. The last run of ore milled 430 and 220 ounces of silver per ton.

MENDOTA.—In the stope west of the shaft, at a depth of 100 ft, there is a vein of ore from a foot to 18 inches in thickness, which is perfectly solid, and will run from 50% to 65% in lead, and from 30 to 100 ounces in silver.

SAGINAW.—On the day of discovery $125 was taken from the apex of the lode, the ore consisting of fine-grained galena, silver glance and black sulphurets, and milling 900 ounces of silver per ton. Specimen assays have run up to 1,000 ounces.

ROE.—Stoping and drifting is progressing on the level west of the shaft, the stope carrying ore that mills 235 ounces for one class of ore, the concentrations from the same place running $45 per ton.

HERCULES.—On the Hercules tunnel level two winzes are being sunk west of the engine shaft. These winzes are 35 and 25 ft deep respectively. West of the gulch two adit levels are each in 500 ft. Recent mill runs from the upper one returned 500 ounces of silver per ton for unclassified ore.

EMMA.—The last run of ore milled 1,264 ounces for first-class and 419 ounces for second class. Other runs milled 703 and 515 ounces of silver per ton.

BIG PINTO AND LITTLE MARY.—The pay streak in these bonanzas is from 10 to 15 ft wide, and assays from 79 to 90 ounces silver per ton, besides they carry a good deal nf gold.

QUEEN OF THE WEST.—A run from the discovery recently reported, of a half ton, gave a returu of 132 ounces silver per ton.

New Incorporations.

The following companies bave been iucorporated and papers filed in the office of the Superior Court, Department No. 10, San Francisco:

SOUTH IDAHO QUARTZ M. Co.—Mar. 3d. Location: Nevada county, Cal. Capital, $300,000. Directors—A. Teal, E. C. Webster, W. A. Nygle, C. H. Moore and A St. Paul.

GOOD FAITH M. Co.—Mar. 3d. Location: Columbus district, Nevada. Capital, $10,000,000. Directors—John Skae. Joseph Clark, William Dutch, C. O. Funk and Chas. Warren.

VENTURA M. Co.—Mar. 4th. Location: Marin county, Cal. Capital, $10,000,000. Incorporators—E. H. Wiley, W. S Edwards, J. C. Chalmers. Frederick Franks and H. P. Wood.

BODIE QUEEN G. & S. M. Co.—Mar. 5th. Location: Bodie, Mono county, Cal. Capital, $1,000,000. Directors—Wm. H. H. Hart, Leander Shores, George S. Carrier, A. H. Todd and J. L. Armstrong.

PARIS M. Co.—Mar. 16th. Object: To operate in California. Capital, $10,000,000. Directors—Wm. Stewart, Wm. F. Herrin, Wm. J. Hutchings, Thomas B. McCauley and Frank Vernon.

THOR & BRIGHT POINT M. Co.—Mar.16th. Object: To operate in Utah Territory. Capital, $3,000,000. Directors—George W. Deltzler, Wm. C. Pease, P. Franklin, Wm. S. Campbell, Samuel Purdy and J. D. Lomax.

CANDELARIA M. Co.—Mar. 17th. Object: To operate in Nevada. Capital, $10,000,000. Trustees—J. B. Russell, Wm. E. Norwood, S. Iglauer, Oscar R. Jones and Cornelius Reilly.

Meetings and Elections.

ATLANTIC GIANT POWDER CO.—The stockholders bave elected the following officers for the ensuing year: President, P. A. Dibble; Vice-President, E. Judson; Secretary and Treasurer, N. Duperu.

THREE HUNDRED members of the Tammany General Committee will go to the Cincinnati National Convention.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

[From Official Reports for the "Mining and Scientific Press," Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

FOR THE WEEK ENDING MARCH 9, 1880.

225,204.—TIN VESSEL—O. J. Backus, S. F.
225,205.—ATTACHMENT FOR DREDGING MACHINES—J. A. Ball, Oakland, Cal.
225,322.—PAPER-BAG MACHINE—E. O. Bennett, Santa Clara, Cal.
225,378.—PEACH STONER—J. K. Hogan, Placerville, Cal.
225,396.—HAY PRESS—L. B. Lathrop, Hollister, Cal.
225,397.—SIGNAL LANTERN—R. W. Lewis, Sacramento.
225,263.—GRAIN SEPARATOR— H. E. Wright and R. Shubb, Stockton, and J. Klees, Sacramento, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

HAY PRESS.—Levi B. Lathrop, Hollister, Cal. Patented March 9, 1880. No. 225,396. The object of this invention is to construct a press for baling hay, wool, cotton, hops, etc., which shall be light and portable, and at the same time strong and durable, to which end the body of the press is constructed of boiler and angle iron. The follower moves in guides and is actuated by a toggle joint, to which power is applied by means of a series of ropes and pulleys. By using peculiar stops any desired parts of the power of the purchase is cut off, so that the horses need not travel so far with the end of the rope, in drawing the toggle down, as they would have to do were all the parts of the purchase moving.

When the pressure is applied the first time only part of the purchase is used; but on the last purchase being applied the stops are removed, and the whole power of the purchase is utilized. The pulleys or sheaves over which the ropes pass are journaled on the hinge-pin of the knee-lever, so as to do away with the use of blocks, and allow the lever to be straightened without too much space being occupied by the purchase.

PAPER BAG MACHINE.—Edward O. Bennett, Santa Clara, Cal. Patented March 9, 1880. No. 225,322. This invention relates to certain improvements in that class of machines for folding and pasting the bottoms of the already-prepared tubes, and at the same time supplying the requisite amount of paste for securing the edges, and also in the mechanism whereby this device is operated, and for regulating the pressure on the pile of bags. A perfect satchel-bottomed bag is formed with very little hand work. The operation of folding and pasting is performed quite rapidly, and there is no danger of the paste being scattered about over any part of the bag except that where it is necessary to be applied.

News in Brief.

VALLEJO has a new evening paper, the *Daily News*.

NAVIGATION is again suspended on the Hudson river.

SIR GARNET WOLSELEY will return to England in July.

A FREIGHT-STATION has been built at Army Point, Benicia.

FORT STEVENS, Or., is in danger of destruction from the sea.

A SCHEME is maturing for uniting the German and Baltic oceans.

SIXTY Italians for San Francisco arrived at New York March 13th.

THREE Negroes are to be hanged for murder in Washington April 30th.

C. C. TAYLOR, city editor of the Philadelphia *Times*, has committed suicide.

APPALLING famine reports continne to come from Armenia and Kurdistan.

THE jury disagreed in the case of Robert Linsey at Ukiah for murder.

THE Pope approves the Archbishop of Cologne's condemnation of Socialism.

THE troubles between the Greeks and Bulgarians of eastern Roumelia continue.

JOHN B. HAWLEY has resigned the office of Assistant Secretary of the Treasury.

THE steamship *Montana* was wrecked Saturday last on the English coast. No lives lost.

SLOSSON, the American hilliardist, has gone to Paris to meet Vigneaux, the French player.

THE wages of the employees of the Ohio and Mississippi railroad are to be increased April 1st.

THE destitute Indians in San Diego are being provided for by kind-hearted citizens of that county.

R. R. DONNELL, an ex-Assessor, was arrested at Bakersfield on Saturday last on a charge of felony.

WM. F. TAYLOR, late Auditor of Public Accounts, was found dead in his bed recently in Richmond, Va.

CHUNG HOW, late Embassador to Russia, has been beheaded, and a revolt has broken out in Pekin.

MISS ADAMS, who caueed the recent sensation in Cincinnati, charges her nncle with being the cause of the trouble.

A ST. PETERSBURG dispatch says that Melikoff's life was saved by a chain shirt in the recent attempt to assassinate him.

A FIRE broke out in the hold of the Pacific Mail steamer *City of Sydney* on Sunday, in this city, doing considerable damage.

P. E. BENEDICT, of Monte Vista, Los Angeles county, claims to have discovered the secret of making fine white crystallized sugar from honey.

ACCORDING to the Dixon *Tribune*, the late Dr. H. H. Toland was the largest individual tax-payer in Solano county. He was assessed last year on 11,601 acres of land in Rio Vista township, 6,081 acres of which was put down at $15 an acre, and the remainder at $5 per acre, making a total valuation, with the personal property, of $162,835, on which the taxes amounted to $3,093.86.

Proposed Changes in the U. S. Mining Laws.

The telegrams from Washington give an abstract of the suggestions of the report of the Land Commission, which visited this coast last summer in search of information. The questions involved in this report are of the utmost importance to the mining community. One recommendation is for the abolition of the present system of locations and substituting the square location, the boundaries of which extend vertically to an indefinite depth. This will no doubt do away with a good many lawsuits and disputes.

In Major Powell's minority report he suggests several important amendments affecting the disposal of pasturage and mineral lands. First of these is as follows: In lands patented under the provisions of this chapter all subterranean mining property and rights for mining purposes are hereby reserved from surface property and rights for pastnrage purposes, and whenever surface property and rights for pasturage purposes to any tract of laud have passed from the Government under the provision of this act, subterranean property and rights for mining purposes therein may be acquired under the provisions of the XIIth chapter of tbis act, etc.

It is also recommended that every patent issued for pasturage land shall contain the following clause: Except and excluding from these presents all subterranean property rights in any mine of gold, silver, cinnabar, lead, tin, copper, coal, iron or other valuable mineral deposit, and property conveyed in this patent shall be subservient to easements necessary for discovering and working mines therein, etc.

In all patents for mineral lands it is recommended that there be inserted a clause excluding all surface property rights, with the proviso, "That there shall be dominant in property conveyed, easements on the surface property necessary for the discovering and working of mines therein."

In support of these amendments to the bill prepared by the Commission, Powell uses the following language: "About one-half of all the lands in the western portion of the United States, bearing gold, silver and other ores of like geological occurrence, are covered with forests, and hence are both timber and mineral lands. Proviso has been made in the tentative bill for the sale of timber that the fee of the land is to remain in Government, and such lands are held free to exploration and acquirement of title as mineral lands."

The other half of these mineral lands are pastnrage lands. It is believed that the enactment of a pasturage law, as recommended by the Commission, without the amendment above indicated, would result in passing a large amount of mineral lands into the hands of persons engaged in pasturage industries, and thus the mining industry of the country would be greatly retarded. A pasturage homestead is necessarily very large, and if it is given to the settler he should not consider it a hardship if mines contained therein are severed from his ownership. It is believed that at least ninety-nine one-hundredths of all the coal lands of the western portion of the United States are situated in lands belonging to the class designated in the tentative bill as pastnrage lands. It has been recommended that coal lands be sold at $10 per acre, but in the Pasturage Homestead Act titles can be acquired to four sections of pasturage lands at a nominal price, and such lands might and will be defined properly as mineral lands—that is, they would contain beds of coal of commercial value. The Pasturage Homestead Act, without the amendments proposed, would defeat the measure designed to secure the sale of coal lands at $10 per acre.

The House Committee on pnblic lands, and mines and mining will hold a joint meeting shortly, to consider this report of the Land Commission. The snbject matter will thus, by agreement, be divided between the two committees for consideration and action upon subjects pertaining to their jnrisdiction respectively.

A full copy of the report will no doubt soon come to hand, when we shall give fuller details. Some further remarks on this snbject are made in another column.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to nur prospectus and terms of subscription, and request that they circulate the copy sent.

EXTRA COPIES can usually be had of each issue of this paper, if ordered early. Price, 10 cents, postpaid.

Chew JACKSON'S BEST Sweet Navy Tobacco

Nothing short of Unmistakable Benefits

Conferred upon tens of thousands of sufferers could originate and maintain the reputation which AYER'S SARSAPARILLA enjoye. It is a compound of the best vegetable alteratives, with the Iodides of Potassium and Iron, and is the most effectual of all remedies for scrofulous, mercurial or blood disorders. Uniformly successful and certain in its remedial effects, it produces rapid and complete cures of Scrofula, Sores, Boils, Humors, Pimples, Eruptions, Skin Diseases and all disorders arising from impurity of the blood. By its invigorating effects it always relieves and often cures Liver Complaints, Female Weaknesses and Irregularities, and is a potent renewer of vitality. For purifying the blood it has no equal. It tones up the system, restores and preserves the health, and imparts vigor and energy. For forty years it has been in extensive use, and is to-day the most available medicine for the suffering sick anywhere.

FOR SALE BY ALL DEALERS.

FRESH attractions are constantly added to Woodward's Gardens, among which is Prof. Oruber's great educator, the Zoographicon. Each department increases daily, and the Pavilion performances are more popular than ever. All new novelties find a place at this wonderful resort. Prices remain as usual.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Atlanta Mining Company.—Location of principal place of business, San Francisco, California. Location of works, West Tintic Mining District, Juab County, Utah.

Notice is hereby given that at a meeting of the Board of Directors, held on the Second day of January, 1880, an assessment (No. 1) of Five Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, room 7, No. 420 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Fifth (5th) day of February, 1880, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Friday, the Twenty-Seventh (27th) day of February, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—Room 7, No. 420 Montgomery street, San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is herehy postponed until Thursday, Februrary 26th, 1880, and the day of sale to Monday, the 22nd day of March, 1880. By order of the Board of Directors.

A. F McGREW, Secretary.

Office—Room 7, No. 420 Montgomery street, San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is herehy postponed until Wednesday, the 7th day of March, 1880, and the day of sale to Saturday, the 10th day of April, 1880. By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—room 7, No. 420 Montgomery St., San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Friday, the ninth day of April, 1880, and the day of sale to Wednesday, the fifth day of May, 1880. By order of the Board of Directors.

A. F McGREW, Secretary.

Office—Room 7, 420 Montgomery St., San Francisco, Cal.

Cataract and Wide West Gravel Mining Company. — Location of principal place of business, San Francisco, California. Location of works, Eho Mining District, Calaveras County, California.

NOTICE.—There are delinquent upon the following described stock on account of assessment levied on the 2nd day of February, 1880, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law, and an order of the Board of Directors, made on the 14th day of January, 1880, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the Company, 314 Bush street, San Francisco, on Thursday, the 11th day of March, 1880, at the hour of 1 o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

T. L. BIBBINS, Secretary.

Office—314 Bush street, San Francisco, California.

POSTPONEMENT.—By order of the Board of Directors, the above sale of delinquent stock of the Rocky Point Mining Company is postponed to Thursday, the 25th day of March, 1880, at 1 o'clock P. M.

T. L. BIBBINS, Secretary.

DIVIDEND NOTICE.

OFFICE OF THE

Eureka Consolidated Mining Company,

Nevada Block, room 37, San Francisco,

March 15th, 1880.

At a meeting of the Board of Directors of the above named Company, held this day, a dividend (No. 53) of Thirty Cents per share was declared, payable on Saturday, March 20th, 1880. Transfer books closed until the 22d inst.

P. JACOBUS, Ass't Secretary.

DIVIDEND NOTICE.

Office of the

BLACK BEAR QUARTZ MINING CO.,

Room 13, Safe Deposit Building, San Francisco,

March 15th, 1880.

A dividend (No. 7), of twenty-five (25) cents per share was declared on the capital stock of the Black Bear Quartz Mining Company, payable immediately.

WM. LETTS OLIVER,

Secretary.

The cheapest and most economical Cylinder Cup. Can be instantly regulated to feed a few drops per minute, and the drops can be counted as they pass through the glass gauge

Cylinder corrosion is not so much owing to impure tallow or oils as to the fact that these animal fats do not maintain their integrity under steam heat, but decompose and set free acids which attack and destroy metal.

The Albany Cylinder Oil does not contain fatty acids—is incapable of being decomposed and does not form insoluble soaps.

If it becomes mixed with boiler incrustation it diminishes its tendency to cling to the sides of the boiler, and thus exerts in this respect also a beneficial action.

THE

Albany Cylinder Oil

Is now in use throughout the world and we refer to nearly all first-class establishments on this coast for evidence of its efficacy.

The Albany Lubricating Compound and Cups, the Albany Spludic Oil, etc., can only be gotten from us or our agents. Send for catalogue.

HERCULES SLAYING THE GIANTS.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade

PATENTED IN THE UNITED STATES PATENT OFFICE.

Those improving water power should not fail to write us for **New Prices**, before buying elsewhere. New Shops and New Machinery are provided for making this Wheel. Address

JAMES LEFFEL & CO., Springfield, Ohio, and 110 Liberty St., N. Y. City.

SAVE YOUR GOLD!

Highly Important to Miners and Quartz Mill Men!

SILVER PLATED AMALGAMATING PLATES.

The best process yet discovered for saving fine or float gold. Extensively used with great success in gravel and quartz mining in various parts of the Pacific Coast. Over one thousand orders have been filled, and the demand is constantly increasing. Old Mining Plates bought or taken in exchange for new Silver Plated Plates. Gold extracted from old Plates at a moderate cost. Old Plates (which often contain a surplus of gold above the cost of plating) can be re-plated.

With the most extensive facilities on the Pacific Coast, orders can be filled very promptly and satisfaction guaranteed. All kinds of metal goods plated. Send for circular.

Judson Powder

IS NOW USED IN ALL LARGE HYDRAULIC CLAIMS.

It breaks more ground, pulverizes it better, saves time and money, and is superseding the ordinary powder wherever it is tried. ☞Triple Force Caps and all Orados of Fuso.

BANDMANN, NIELSEN & CO.,

SAN FRANCISCO, CAL.

Rotary Pulverizer,

(WHITE'S IMPROVED,)

For Disintegrating Ores and Other Substances.

GUARANTEED TO BE EQUAL IN CAPACITY TO A

HUNDRED STAMP BATTERY!

IS FITTED UP WITH

Homogeneous Steel Beater Bars.

Found to be more durable than either Hard Steel or Soft Iron. Dry-crushing the hardest rock; will last for months, and without the slightest danger of breakage.

The Pulverizer requires about one-third the power usually expended for the reduction of the same amount of Ore by Stamps.

Price List, Etc., of the White Rotary Pulverizer.

No.	Tons Per Hour.	Inches Diameter.	Revolutions Per Minute.	Horse Power Required.	Shipping Weight.	Lumber Required.	Price.
1	6	56	600	40	12	6,000 ft.	$5,000
2	10	72	470	60	15	9,000 "	8,000
3	16	84	400	75	20	12,000 "	10,000

The Repairs on the Pulverizer will not exceed those of a 10-Stamp Battery.

The Shipping Weight of the entire apparatus is not one-eighth of that of Stamp-Mortars required to do an equal amount of work. ☞It can be placed and put running at the Mill in from fifteen to twenty days.

Address GEO. W. WHITE, Inventor.

Manufactured exclusively at the ÆTNA IRON WORKS, 217 Fremont St.

San Francisco, Cal., January 1st, 1880.

SECURE PATENTS

Through Dewey & Co.'s **Scientific Press** Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free. DEWEY & CO., PATENT AGENTS.

VOLUME XL. Number 13.

Congress and the Chinese Question.

The President has sent to the Senate three nominations, as follows: James B. Angel, of Michigan, to be Envoy Extraordinary and Minister Plenipotentiary to China, vice George T. Seward, recalled, and John F. Swift, of California, and Wm. H. Wescott, of South Carolina, to be Commissioners to China to negotiate a treaty with that empire.

The appointment of this commission is a very important matter to the interests of California. The *Call's* Washington correspondent has interviewed the members of the Pacific coast delegation to obtain their views on this new movement.

Senator Booth and Representative Horace Davis agree in saying that although this plan is contrary to their advice and wishes, and that while they would have vastly preferred the appointment of Mr. Swift as Minister, or, failing in that, would have desired to have the negotiations entrusted to him as the sole Commissioner, they nevertheless consider it a substantial gain to have the work placed in his charge in conjunction with another Commissioner, rather than have it entrusted to any Eastern Minister, or to an Eastern Commissioner alone. They also understand that these Commissioners are to be sent out with positive instructions to accomplish the object of restricting Chinese immigration to this country. At the same time they purpose continuing their efforts to procure the enactment of the fifteen-passenger bill by Congress.

Representative Page is unequivocally opposed to the commission as constituted by President Hayes. He remarks that, of course, nothing can be accomplished through negotiations, unless the diplomatic representatives of our government and the Peking authorities arrive at an agreement; and this, he says, cannot possibly be expected, for the Chinese government and Eastern Minister and Eastern commission will be certain to range themselves on one side, while Swift will stand alone on the other. "If," says Mr. Page, "the President and Secretary Evarts are acting in good faith, they should appoint a minister who represents a principle opposite to that represented by the Chinese government, and send him to Peking with instructions to insist upon a modification of the treaty to restrict Mongolian immigration. If positive instructions of this sort are to be given, one commissioner is as good as two or a dozen commissioners."

Congressman Pacheco says that as a direct proposition he has been opposed to it; but as it has been done, it must be accepted, as something is much better for the administration to do than to do nothing. He regards it as a step forward, which will result in advantage to the anti-Chinese movement by attracting Eastern attention to the importance of the subject, if no other way.

Congressman Berry does not believe that the new plan will amount to anything. The Eastern commercial and so-called humanitarian influences will be sufficient to produce a decision of opinion in the commission in regard to the question of immigration, and China, being unwilling to yield the advantages she now enjoys under the one sided Burlingame treaty, will readily take advantage of this division to prevent anything being accomplished. Moreover, he believes the Eastern Minister will exert his influence against us on this question.

Representative Daggett regards this movement simply as an effort to take the Chinese question out of politics. Mr. Daggett also believes that under this proposed commission plan the Chinese could, and would, consume three or four years of time in negotiations.

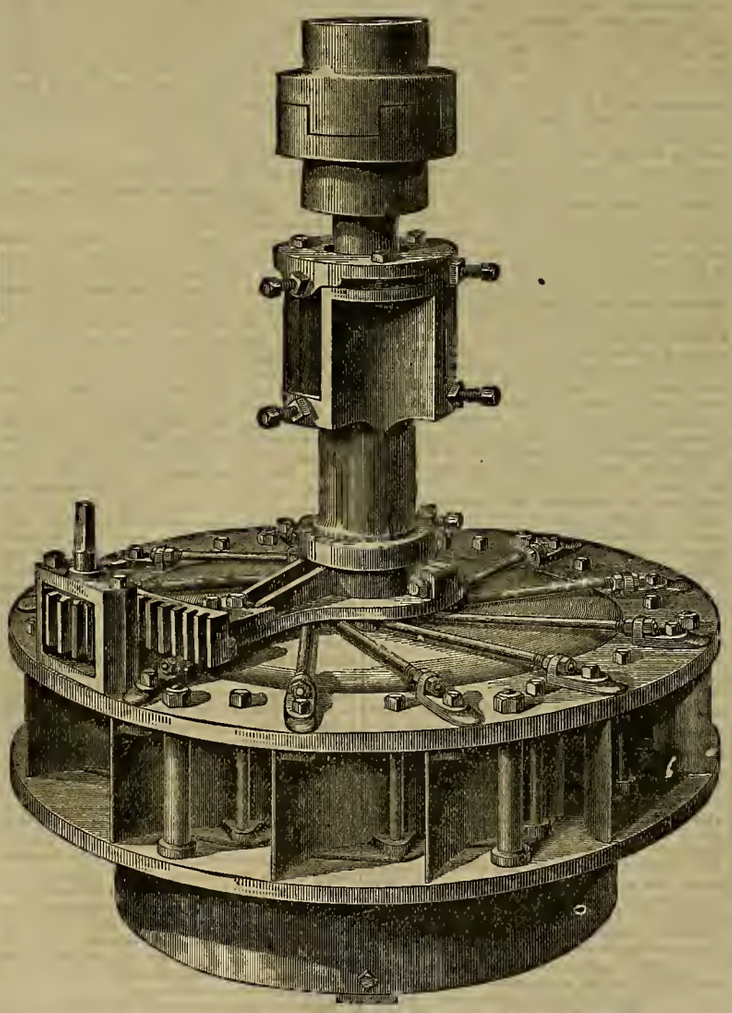
Congressman Whittaker also regards this commission idea as a device to remove the Chinese question from politics and allay its agitation for the time being.

Senator Farley says the proposition is a departure from all usage and custom. A Minister appointed from the Pacific coast might have accomplished something; but a California Commissioner, who, in all probability, will find himself handicapped at every turn, cannot be expected, under such circumstances, to accomplish anything.

Senator Jones, of Nevada, denounces the whole plan as a humbug, and a cowardly scheme to take the Chinese question out of politics and away from Congress. He considers it mere shuffling and evasion on the part of Hayes and Evarts.

The Leffel Double Turbine.

We give on this page an engraving representing the general appearance of the Leffel double turbine wheel, as completed and ready for attachment of shaft above it. This wheel is a thoroughly tested hydraulic motor, proven by practical tests to secure the greatest economy of water, together with the greatest degree of durability. The various working parts of the wheel have been improved, through greater accuracy in their formation, and increased durability of material. The facilities for perfected manufacture of the entire wheel have also been increased from time to time. Notably has this occurred during the past year, when new, extensive and convenient works have been built for the construction of these wheels.



IMPROVED LEFFEL DOUBLE TURBINE WATER WHEEL.

Among the most noticeable modifications and additions made (some of which are patented), are the improved link for operating the gates; the process for lining the iron plates with brass or any anti-corrosive metal (applied only when specially ordered); the combination of the toothed segment with the gate-arm in such a manner that the segment can be removed when the teeth become worn, and a new one supplied; the spherical iron penstock; the use of steel gates or guides for some sizes, instead of iron; and the improved method of casting solidly in one piece both wheels, by means of which the edge of the diaphragm can be made much thinner, and yet stronger, assisting also to separate more perfectly the due proportion of water to each wheel. Half the buckets being made of good boiler iron, and the fillets retaining them been improved, both in form and strength, it is impossible to break or tear out any of them; as a result of which, out of the last 5,000 wheels put in operation, not one has lost a single bucket.

The Leffel double turbine is constructed and acts upon principles, which are peculiarly characteristic of it as a water wheel, and upon which its reputation has, to a great extent, been established. There is in it a combination of two independent sets and kinds of buckets, one a vertical, the other a central discharge, each entirely different in its principle of action upon the water, yet each wheel or series of buckets receiving its water from the same set of guides at the same time; but the water is acted upon but once, since half the water admitted by the guides passes to one wheel, and the other half of the water to the other wheel, the water leaving both wheels or sets of buckets at the same time and as quickly as possible. These two sets of buckets are so combined as to make really but one wheel; that is both are cast in one piece and placed upon the same shaft. By this arrangement there is admitted the greatest possible volume of water, consistent with its economical use, to a wheel of any given size, and at the same time the greatest area for the escape of water is secured. The surface in the wheel is thus reduced to minimum as compared with the quantity of water used, avoiding a very material loss by friction, which otherwise seriously diminishes the working power of a wheel. The value of this arrangement will be fully appreciated by those who understand the practical effect of the frictional surface in a water wheel. Messrs. Parke & Lacy Nos. 21 and 23 Fremont street, San Francisco, are now agents for the James Leffel water wheels on this coast.

The Mines and Mining Industries of Utah.

From an intelligent and careful observer who has just returned from a trip to Utah, made partially in the interests of this journal, we obtain the following information in regard to the history and present condition of mining in that Territory. This industry, as is well known, was at the outset forced to encounter in Utah many obstacles, some of them being of a peculiar and exceptional kind. In the first place, the ruling powers in the Mormon church exerted themselves to deter their followers from engaging in the business, as well as to interpose hindrances in the way of others who sought to do so, a policy that tended to retard mining long after the great mineral wealth of the country had become a well established fact. When, after the lapse of several years, this pursuit had got well on its feet, and was beginning to attract capital to its aid, it met with a sharp set-back through the failure of the Emma, the Flagstaff, and several other large companies, mostly English, who, having in the first place paid excessive prices for their properties, afterwards administered them with as little business sense as they had manifested in their purchase. These disasters dealt a staggering, and what was at the time by many thought to be a fatal blow to mining in Utah. Alarmed by these signal failures, business men became cautious, merchants restricted their credits, and capitalists avoided the country, over which a dark cloud for the time being seemed to settle. But, as often happens, these misfortunes proved to be blessings in disguise. Thrown upon their own resources, locators had no alternative but to go to work and open their claims with their own labor, subsisting and defraying current expenses with the proceeds of such small lots of ore as they were able to get out while carrying on the work of exploration. The result of this has been that the mines of Utah are to-day more generally developed than those of any other country in the west except California, these properties remaining meantime almost wholly in the hands of the original owners, who are, as a class, in pretty good financial circumstances.

While the mines in this Territory are generally so well exploited, it is the case, too, that they are well distributed over the country, there being one or two and sometimes as many as a dozen or more really good properties in almost every mining district. For the most part, these districts are of easy approach, several of the more central being already connected with Salt Lake city by railroads, for the construction of which the topography of the country is highly favorable. In the course of a few years, every important mining locality in the Territory will in like manner be put in communication with Salt Lake city, and, through the Utah Central railroad, extending thence north to Ogden Junction, with the great transcontinental thoroughfares which meet at that place.

With these facilities for effecting cheap transportation and promoting intercourse with the outside world, the business of mining for the precious metals can hardly fail to make rapid progress in Utah for some years to come.

A more full account of mining operations, with some notices of the more prominent mines in that Territory, will meet with early publication in the PRESS.

THE "Council of 200" have nominated as freeholders for the coming election, 15 prominent citizens, composed equally of Democrats, Republicans and Independents.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds

An Insane Land Commission.

EDITORS PRESS:—I bave read with surprise and indiguation a telegraphic outline of the recommendation which the Public Land Commission make to Congress relative to the locating of mineral lands. The changes proposed are so sweeping in tbeir nature that it behooves mining men to see that they are fully considered in all their hearings, before being permitted to go upon the statute hooks. The commission advises Cougress to enact a law which will reqnire a prospector to he in possession of nearly a thousand dollars before he can explore the public lands or locate a single lode. After setting his stakes and discovering mineral, the miner must, within ninety days, go, perhaps one to two hundred miles, and file copies of his location notices at a land office, and pay $50 to the United States. A survey will then be ordered, and, before a year from the date of location expires, he must apply for a patent, and prove that he has done work of the value of $500 upon the claim, or all his rights are forfeited. Now, the fact is notorious to every person who has lived in or visited our mining States and Territories, that mining districts are discovered and new mines taken up hy men who, in nine cases out of ten, have not $5, in money or credit, at their command. The prospector is usually an enterprising, fearless fellow, who goes out into the wilds of a new country, and, for the public good generally, more than for his own, finds and locates mineral lodes or claims. To requiro such a man to do what the commission proposes, is simply to put him out of the field as a prospector, unless he can get a capitalist to "grub-stake" him, and probably also "freeze" him out of his remaining interest.

The proposed change is uuwise: 1st. Because its adoption would confer no benefit on the country, or on the mining community, or, indeed, on any one save a few officials in the land offices. 2d. Because it would practically put an end to all mineral explorations in new countries by poor men; and 3d. Because it is emphatically and unequivocally a deep-laid scheme in the interests of monopolists having a command of money.

Heretofore there has heen remarkable liberality shown by our Government towards the mining explorer, and it is mainly owing to this that our mineral wealth has heen laid open before the eyes of the world.

The discoverers of the Comstock lode could not have complied with the requirements this sapient commission would like to saddle on the miners of the country in the locating of claims. Is the entire spirit of the Government towards miuing interests to be overturned, because a commission, that does uot know wbat it is doing, has succeeded for a brief moment to let its silly coousels he heard above the clang of prosperous mining work? It is not in one tbing that the recommendations of the commission display the verdancy of its individual members. Our present mining law has been working well for years, and wbere its requirements are obscrved in the locating of mines, there cannot be any opportunity given to blackmailers to cloud titlcs acquired under it. The trouble is, that there is not one location in twenty that is strictly made in accordance witb the law. Is that evil—proceeding from the lack of education and business training on the part of prospectors—to be done away with hy a wholesale overthrow of the prospecting class, unless they are fortunate enough to he possessed of a given amount of ready money? The commission recommends the passage of a law requiriug mining locations to be made with

Vertical Lines

Going downwards into the earth, no matter how the lode outcropping within the claim may pitch—steep or flat. It ought to be a cause of deep mystification to the members of the commission to perceive that the Creator did not foresee their appearance at this stage of the world's history, and anticipate their wishes by making every lode assume a truly vertical position.

It is a perversion of the truth for the commission to assert that the majority of miners in the Western States and Territories are in favor of square locations and the abolition of local customs and regulations in respect to the locating and holding of mines.

The Leadville prospectors who were unsuccessful in getting a share of the flat beds of ore discovered there, have no doubt felt that the law of 1872 was the principal harrier in their way to desiderated fortune. But since a lode is a lode, whether it is vertical, inclined or flat, there is no use in wasting time or words as to rights justly acquired uuder existiug laws. If the early locators of the Leadville ore beds have beon unusually fortunate, that is no reason why a hare-hrained commission should deprive a whole army of prospectors of the right, or power, to explore vacant mineral lands. Here is one member of the commission who has proved on the witness stand in courts of justice that he is very far from heing infallihle. I refer to Clarence King, who, as a paid expert for the Richmond Con. mining company, testified, on one occasion, that the Richmond lode was a true fissure vein. A few years later he appeared for the same company in another snit, and, as his testimony was then required in a different direction, he swore as solemnly as he had done years before to an opposite theory—that the Richmond lode was nothing hut a "pipe vein." On being confronted with a printed copy of his first testimony, he admitted that he had been mistaken on that occasion; that in fact he did not know much of the subject he was called upon to elncidate. If this fallible commissioner could blunder so egregiously when he was testifying under oath, is there any certainty that he is infallihle now when he is leading a band of reckless spirits, whose object is to expel mining prospectors from tbe United States? The expulsion, I am very eure, will not be so easily effected as the commission imagines.

In respect to square locations, it is folly to overlook the fact that every mine on the Pacific coast, of any note in deep mining, is heing worked ontside of such vertical lines as would have been estahlished if the law proposed by the commission had heen in force at the time of its discovery. The Comstock and Eureka mines now heing explored over 1,000 feet from the surface outcrop, afford incontestable evidence of the absurd principle of vertical side lines in locating.

If the law of 1872 must he changed to please grasping people, who have the communistic idea that, when things are broken, some good must come hy the change, why not make tbe side lines of a mining claim go down into the earth corresponding to the apparent inclination of the lode itself? Suppose a locator decides within three months after discovering a lode, that it goes downwards at an angle of 50°, give him the right tben to side lines with a like inclination, and keep intruders from crossing such lines either on the surface or underground. The only risk in that case will come from the lode bearing in an opposite direction to that shown on the top, hut a good prospector ought to discover tbis before he fixes his lines.

The commission bolieves it is saying something wonderfully "smart," when it speaks of the law of May, 1872, as "an act to cause the Government to join with an unknown second party, to convey to a third party an illusory title to an indefinite thing, and encourage the subsequent robbery thereof." This assertion, as applied to the law in question and to its effects on mining titles, is willfully and slanderously untrue. The words hear witness, themselves, that they were written hy the Rev. Edward Probert, managing director of the Richmond Con. company at Eureka, Nevada, and sent to his bumble servant, Clarence King, to be inserted by him for effect's sake in the report of the commission. The numerous law suits of the Richmond company were not due in a single instauce to anything connected with, or influonced hy, the mining law of 1872. The Rev. Probert aforesaid, with his Englisb hull-headedness and defiant neglect of law, justice and the rights of neighboring mine owners, was the chief cause of at least one of these suits, and being justly defeated, it is too late now to have revenge on all the miners of America, through Clarence King's help, hecause he could not sway United States Judges according to his will.

I have no more to say for the present, bnt may revert to the subject in another letter. I trust that the outrageous recommendation of a weak, worthless commission will be quickly disposed of by the good sense of our practical miners. They need, however, to discuss the whole snbject through tbe local newspapers.

J. D. EMERSLEY.

Dos Cabezas, Arizona, March 9, 1880.

Oreana and its Vicinity.

EDITORS PRESS:—Your repertoire of mining news has not had views of Humboldt county, Nev. Perhaps the county is to blame—the rocks and rills can hardly be. Trinity, an extinct district, lies west from Oreana and northwest from Lovelock, 10 miles from each. The canyon seems to have heen showered with drops when Mides sprinkled his yellow garden. The mines are narrow, compared to the Comstock, hut they are rich in silver and gold, and Comstock cannot deny the "blood." The Rye Patch, Alpha, Numa and other prominent mines, not excluding the Paradise lodes, that have lined pockets and added to our vocahulary, have none of them sought for ores at any depth; "blocks" of noble metal are found when songht for helow the water level, when the indications are favorable on top. Ores that produce $1,000 and $2,000 per ton are worth seeking, at some cost. Trinity is filled with such veins, and dollars have been coined from its yield that hundreds of thonsands are needed to tell of. Some capital, a good deal of economy and average brains, will make a new town where old Rome died from too many Antonys and Cleopatras. The Arabia district sent her half million and only made a hole on top of ground. Limerick, in the Star Peak range, has some faithful miners that will win success. Hope and Bennett and Bush have made some hard studies in geology, and the prospects are they will meet with reward. The whole county seems covered by a dream; cannot the PRESS awaken it? Undeveloped wealtb is here near the surface. Bad management and morals and non-residence have been the cause of its past misfortune. Lovelock is a town that boasts of everything (but harmony), on an agricultural basis, when it should vie with Oreana as a mill, whistle-blowing town.

R. S. D.

New Mining Fields on Upper Joaquin and King's Rivers.

EDITORS PRESS:—Your issue of March 13th very aptly calls the increased interest for the past year in mines, prospecting for same and results, as a "mining boom." To no State could this term be more truly applied last year than to California, and to no portion of it more than to the lower and higher Sierras along tbe San Joaquin, Fresno river, King's river, the Kaweah, and their tributaries. Letters and cullings from various sources informed your readers last summer and fall quite fully of the lively prospecting and developments in the Fresno Flats, Lake, North Fork, Minaret, Laurel and Prescott districts, in Fresno and Mono counties. In conversations about snch matters, the question has been frequently asked, "Has any late prospecting heen done along the South Fork of the Sin Joaquin river, in all that comparatively unexplored mountain region of Fresno county?" Only of late have we been able to get an answer to this question.

Impelled by Valuable Discoveries

In several new mining regions in the summer of 1878, as well as hy light crops and dull business, numerous farmers and others from Fresno county, in the Dry Creek region and around Fresno City, determined to do some thorough prospecting in the very high, rough and inhospitable country along the South Fork of the San Joaquin, especially around the sides of Mt. Goddard. The result was that about fifty prospectors visited that region last summer, did much laborious and careful prospecting—so long as the weather in those high altitudes permitted—located at least a hundred claims on more or less promising quartz ledges, and organized what is now known as

Fresno Mining District.

Among these prospectors were John Doak, the three Collins brothers, two Wyatt brothers, Messrs. Wackford, Garrison, Wainscott, Field, Tadlock, Winchell and Faber. The legal extent of this new district is about 12 hy 18 miles. This wild and literally trackless—mostly trailless—part of the Sierra Nevada, is very difficult of access. For the following items of the route taken by these pioneer prospectors of the silver and gold-bearing ledges of

Mt. Goddard, Mt. Humphreys, the Palleidee, And their vicinity, and for results, your correspondent is indebted to Mr. Doak, Mr. Collins, Mr. Faber, and others:

Their route from Big Dry Creek P. O. was via the Toll House, 18 miles, thence to Donaboe's mill, 10 miles, and to Stevenson's creek, 7 miles. Here families of men who drive their sheep to the mountains for summer pasturage, often spend the summer. Thence, they went 23 miles to Dinkey lakes, the source of Dinkey creek, a tributary of King's river. From there tbey went across a low divide, 6 miles to the head-waters of Big creek, a tributary of the San Joaquin; thence to a large lake, 5 miles distant. From this point they followed the creek down to the main San Joaqnin, 5 miles, to Blaney's Camp, a place well known to "sheep men." This is described to me as some tbree miles below where the South Fork enters the main river. From Blaney's Camp they went up the main San Joaquin about three miles, and, recrossing to the south and west side, followed up the South Fork on its east side some six miles. Here they crossed hack to the west side, and traveling about eigbt miles southwest, found themselves under the towering peaks of

Mt. Goddard,

And, as shown hy an aneroid barometer in the party, at an altitude of 12,500 feet. Here they found the huge outcroppings of numerons mineral-hearing quartz ledges, of which we shall presently give a brief description. These outcroppings are immediately at the hase of the precipitous and rugged peaks of Mt. Goddard, which, as they fouud, consists of hlack slate. Some of tbe younger and stouter men of the party attempted the difficult ascent of this high, abrupt peak, and one or two succeeded in reaching its giddy top, while others were forced to stop from nose-bleeding, difficulty of breathing and exhaustion, hecause of the extreme rarity of the atmosphere. They estimated the top of this peak to he hetween 1,200 and 2,000 feet higher than tbe quartz outcroppings abovenamed, a close correspondence with the measurement of our geological survey. Near the outcroppings of these mineral ledges (12,500 feet altitude) which they located, are two small lakes a quarter of a mile apart.

These are the sources of the South Fork of the San Joaquin lying on the northwestern slopes of Mt. Goddard, at a point, as well as they could make out, some 10 miles due west of a red peak on the summit, where they found numerous other mineral ledges, and which, almost beyond douht, is

Mt. Humphreys.

The latter hy close examination they found to he composed of slate, porphyry and red lava, evidently the cone and crater of a volcano long since extinct. Immediately west of Mt. Goddard they found a high ridge of granite surmounted hy three peaks, forming altogether an almost impassible barrier in that direction. Upon its southwestern slope, are some of the sources of the Middle Fork of King's river.

The aforementioned outcroppings of quartz on the northern slopes of Mt. Goddard, they discovered are divided into three mineral-bearing ledges which have every indication of being true fissure veins. They extend almost due north 2½ miles to the banks of the South Fork of the San Joaquin, descending in that distance from a hight of 12,500 to about 9,500 feet. The general color of the ore is purplish gray, and assays show it contains chiefly copper and silver. One regular assay gave per ton $56 copper, $40 silver and $12 gold. Cap rock near Mt. Humphreys, extending for two miles, yielded from $3 to $5 gold. Mr. Faher also gave me the results of an assay of similar ore from a ledge he found on the South Fork 7 miles below Mt. Goddard, as follows: ¼ copper of finest quality, $67 silver and $2 gold per ton. There are said to he at least seven true fissure veins on Mts. Goddard and Humphreys.

The greatest depth of any of this prospecting was six feet. The entire region in question is not yet more than half prospected. In fact, it is very difficult to prospect there.

Timber is Generally Scarce—

In strong contrast to the heavily timbered districts along the main San Joaquin and its North Fork, as described in your columns by my letters last fall. Much of the country in the Mt. Goddard district is bare, showing only rocks, snow and water. In many localities you must pack wood for camp-fires. Yet for the "Fresno Mining District" a good mill-site has already heen located, on the South Fork at an altitude of 9,500 feet, where the three ledges described descend from Mt. Goddard. Here they have sufficient timber for mining purposes for a short time. But for heavy timber tbey must go 12 miles to the main San Joaquin. It is an odd and interesting fact, that this mill-site has the same altitude as Mammoth mill and Highland City.

Iron Ore of the Best Quality

Is found in considerable deposits in this locality along the South Fork. In fact, in the foothills hut 12 miles east of Big Dry Creek P. O., there is a fine ledge of chrome iron 15 feet wide, which is said to be 44% in purity. The parties above mentioned propose to prospect and develop their extensive claims more fully this summer. They expect to hegin a tunnel 1,000 feet in length, and 2,000 feet helow the outcroppings, with which they design cutting three ledges, hoping to strike a test ledge wheu the tuunel is in 100 feet.

Indeed, so soon as the snow disappears sufficiently, the vast mountain regions along the upper San Joaquin and King's river, with their numerous branches, will swarm to an uuusual degree with old and new prospectors, for huudreds who, a few years since, gave up mining on the Pacific coast for farming and other pursuits, are now from the disappointments as well as from the alluring hopes of life, returning to their first love—the miner's toilsome, rough, adventurous and intensely exciting craft.

J. W. A. WRIGHT.

Hanford, March 15tb.

A Test for Nickel.

EDITORS PRESS:—Among my excerpts from your paper I find the following nickel test: "Zanthogenate of potassium in aqueous solution gives, with a trace of nickel, an intense yellow color. If more nickel is present, a yellow precipitate which does not disappear on addition of ammonia. Copper gives a similar yellow precipitate which disappears on addition of ammonia."

A young metallurgist of my acquaintance, Mr. George F. Beardsley, has tested this test with the following results, which I witnessed: The test for nickel is quite delicate, hut the facts are reversed in that it is the nickel precipitato which disappears (dissolves) in ammonia, while that from copper does not.

Cohalt gives with the zanthogenate of potassium a greenish yellow precipitate, insoluhlo in ammonia. The color is hest scen by reflected light. Zinc gives a white precipitate, soluble in ammonia.

Nickel and copper together in solution are distinguished hy treating the mixed precipitate with ammonia; the nickel dissolves and is separated from the copper by filtration. The filtrate is then neutralized with acetic acid, when tbe yellow precipitate of nickel again appears.

Zanthogenate of potassium is made hy adding hisulphide of carbon to a solution of caustic potash in alcohol. It crystallizes in colorless, silky needles. Ethylsulphocarhonate = $KC^3H^5OS^2$.

C. H. A.

THE ELECTRIC LIGHT IN COAL MINES.—In view of the fatal colliery explosions which are continually occurring, it is surprising that some adaptation of the electric light has not heen tried underground. It is questionable whether any of the so-called safety-lamps are quite safe under all circumstances in a fiery mine; at any rate, it is well ascertained that the men are in the habit of opening them, and some of the most destructive of recent explosions have heen traced to this cause. It is true that the hest arrangement for electric lighting is very far from perfection; hut, however crude, it is nevertheless employed in lighting thoroughfares and factories in many places successfully, and at a comparatively moderate outlay. Between the effulgence of the electric light at the bottom of a colliery, and the glimmer of the Geordie or the Clancy, there can he no comparison, the cost of the application would not he great, and it would give absolute safety to the miner, so long at least as he kept from etriking matches.

MECHANICAL PROGRESS.

The Fly-Wheel.

If we examine the rotative effect of the pressure on the crank-pin of a steam-engine, we find that at the beginning and termination of the stroke, this pressure, whatever its amount, has no useful effect. On the contary, it may readily be seen to result in a doubled loss, being, in this respect, accountable for a considerable percentage of the total friction of the engine. Theoretically, this condition, a lack of useful effect, exists at but two points in an entire revolution; practically, and because of friction, it exists for an appreciable time and through considerable space. This is really a serious defect in the reciprocal engine, but one for which there seems to be no remedy, since other forms of construction entail more serious losses in some other directions. If the pressure on the piston was constant, and there was no friction, the rotative effect of that pressure, starting from zero at the beginning of the stroke, would increase up to about mid-stroke, where it would be at its maximum; and from which point it would as gradually decrease to the end of the stroke, where it would again be at zero. Practically the same conditions would exist during the return stroke, completing the revolution of the shaft; while somewhere between zero, or no effect, and the maximum effect, would be the mean effect, representing the resistance against which the piston was moving, translated into the rotary motion of the shaft. Since the maximum effect is above the mean effect, it follows that it will tend to accelerate the motion of the shaft; while at another time, the effect being at zero and below the mean effect, the resistance to the turning of the shaft, due to the power transmitted, would in a like manner retard its motion, so that the shaft would be moving at different velocities at different times in its revolution; and, whatever the corrective means employed to neutralize this tendency, this is exactly the way it does move. The ordinary duty of the fly-wheel is to bring about an *approximation* to equal, or uniform the turning of the shaft; and it does this by absorbing the excess of energy at one portion of the stroke, and giving out the energy thus absorbed at another portion. But it is plain the fly-wheel can not absorb energy without increasing its velocity, neither can it part with energy without losing some of its velocity. Hence, the popular belief that the crank-shaft of a well-constructed engine moves at a uniform velocity may at once be seen to be a popular delusion. The weight and velocity being the factors which determine the energy of the wheel, and the weight remaining constant, its energy can only be increased or decreased by increasing or decreasing its velocity.

But as the change in its velocity will be in the inverse ratio, which the energy added to or subtracted from bears to the normal energy, it follows that with a wheel infinitely large this change will be infinitely small, while with a wheel infinitely small the change will be correspondingly large; thus the motion will be very regular, very irregular, or anywhere intermediate according to the corrective energy of the fly-wheel. The problem is after deciding upon the amount of irregularity permissible, and the extent of the causes which produce this irregularity, or, rather, the total effect of these causes, to so proportion the wheel as to keep within the limit of irregularity fixed on. To this it is always advisable, and frequently imperative to add something to the weight for sudden fluctuations in load. As the variation in rotative effect, for a given mean effect, is due to causes which may vary, and generally do vary, from some peculiarities in construction; and since the *vis viva* of the fly-wheel varies as the square of its revolutions, it is manifest that, at the best, it can only be determined from a perfect knowledge of all the elements in the case, and so can not properly be referred to any one of them. Since, however, the practice towards greater uniformity of piston-speed, it would seem proper to proportion the diameter to the stroke of engine; when, as is the case to a great extent in this country, the fly-wheel is also the band-wheel, more uniformity in belt-speed would obtain. If, for instance, a diameter of four times the stroke was universal at the same piston-speed, the same belt-speed would result, regardless of what the stroke might be. The belt-face may then be one and one-half times the diameter of the cylinder for ordinary sizes, and the depth of rim will be from one and one-half to three and one-half, or even more, varying, of course, to suit different conditions. This will meet ordinary practice perhaps, as well as any simple suggestion; but the purchaser should bear in mind that a heavy fly-wheel means close regulation, or, at least, that he can not have good regulation without it.—*F. F. Hemenway, in Cincinnati Artisan.*

ELECTRO-MEASUREMENT OF THE HARDNESS OF STEEL.—An apparatus has been produced by Prof. Wattenbofen, of Prague, for measuring the hardness of steel electro-magnetically. Its principle is that hardness of steel may be very correctly inferred from a numerical determination of its coercive force. In its main features, his arrangement is as follows: From one end of a balance arm are suspended successively, in a brass bolder, bars of the steels to be examined —those being as nearly as possible equal in weight. The other arm bends obliquely downward, and bears a constant weight. Motion of the beam causes a pointer to move radially over a scale, the movement being magnified by toothed wheels. One of the steel bars having been suspended, a magnetizing coil, equal to it in length, is raised on a stand so as to inclose the bar, and fixed with a binding screw when it does. Then a current is sent through the coil; then the coil is released and moved gradually down, pulling the bar with it, till the latter breaks away, and the deflection of the pointer is noted at which this occurs. This affords an estimate of the hardness of the steel. For example, a bar, A, gives a maximum attraction, 9.6; a second bar, B, 15.5; a third, C, 14.6. It is inferred that A is considerably harder than B and C, and of the two latter, C is harder than B. Precautions are taken in the apparatus to prevent injury to the parts from the sudden recoil when the hold of the coil on the bar ceases.

THE WEIGHT OF CAST IRON.—The following letter is clipped from a late number of *Iron*, of London: "I shall be glad if any correspondent can inform me if there is any reason to suppose the weight of cast iron was greater 60 or 80 years ago, as manufactured then, than it is now, or not? The School of Naval Architecture at this time takes cast iron in its calculations as weighing 447 lbs. to the cubic foot, but I find in Sir Howard Douglas's work on Gunnery that the size of cannon balls about 1815 infers a greater specific gravity for them. Thus, as given in his work;

9 lb.	cannon ball was of	4.00	in. diameter.
18	" "	5.04	"
32	" "	6.11	"

Now the weight of spherical bodies is in proportion to the cube of their diameters, and calculating according to that rule I find the actual weight of these shot would be only 8.60 lbs., 17.22 lbs. and 30.70 lbs., or considerably less than their reputed weight, unless the castings were of greater specific gravity than is now reckoned. A difference of 1¼ lb. in a 32-lb. ball is of consequence, and could scarce arise from any mistake in so expert and learned an author as Sir Howard, who is precise to a fault."

A LOG RAILROAD.—A log tramway or railroad in use by the Richardson Bros., at their mill, south of Truckee, is a very ingenious piece of machinery. Logs, ten inches to a foot in diameter, are hewn round and smooth and their ends are coupled together by iron bands. These logs, laid side by side upon graded ground for a distance of perhaps three miles, form the track. Of course the road looks quite like an ordinary railroad track, except that logs are used instead of rails and the ties are at much greater intervals. The wheels of the engine and cars are concave on their outer surface, and fit the curve of the logs. The power is applied to a wheel in the middle of the forward axle on the engine. The most remarkable loads of logs are hauled upon the cars, and the affair is a decided success. It is very cheap, its construction is simple, it is not easily damaged, and its operation is all that could be desired. By means of this log railroad the Richardson Bros. are enabled to get their logs to the mill from the forest, three miles distant, at a cost far less than it is ordinarily done.—*Truckee Republican.*

DEADENING NOISES OF WORKSHOPS.—To those who carry on any operations requiring much hammering or pounding, the following, from the *Workshop Companion*, will be a great relief. 1. Rubber cushions under the legs of the work-bench. *Chamber's Journal* describes a factory where the hammering of 50 coppersmiths was scarcely audible in the room below, their benches having under each leg a rubber cushion. 2. Kegs of sand or sawdust applied in the same way. A few inches of sand or sawdust is first poured into each keg; on this is laid a board or block upon which the leg rests, and around the leg and block is ponred fine dry sand or sawdust. Not only all noise, but all vibration and shock are prevented; and an ordinary anvil, so mounted, may be used in a dwelling house without annoying the inhabitants. To amateurs, whose workshops are usually located in dwelling houses, this device affords a cheap and simple relief from a very great annoyance.

THE MARINE BICYCLE.—Quite a sensation was created on the river recently by the exhibition of what Mr. Urch, the inventor, calls the "marine bicycle." It is constructed after the catamaran style; the length of this one, which is built as an experiment only, is 25 feet; the two boats are each six inches wide and six inches in depth, and about three and a half feet apart, and held in position by wooden bars. In the center is placed the bicycle, and from it extends aft an iron rod eight feet long, to which is attached the propeller; this is between the boats, and the present power, which will be greatly improved, gives her speed enough to heat any dory on the river. The steering gear consists of a rudder on each boat, and the machine answers the helm quickly, considering its length. One good point is that it can be stopped almost instantly, when under full speed. It will probably be one of the most popular river amusements.—*Portsmouth Gazette.*

IT is claimed for a process patented by Chas. J. Evans, that blooms can be made from scrap iron by the use of one barrel of petroleum to the ton, equal in quantity to the best Swedish blooms, and at a total cost not exceeding $35 to the ton, or about one-quarter of the present price of the Swedish article.

SCIENTIFIC PROGRESS.

Transmitting Colors by Telegraph.

Dr. H. E. Licks, of Old South Bethehem, Pa., after three years' labor, claims that he has perfected an instrument by which forms and colors can be sent by wire the same as words are sent. He calls the instrument a diaphote. The word diapbote, from the Greek, *dia* signifying through and *photos* signifying light, has been selected as its name, implying that the light traveled through or along a wire. He read a paper on his invention before a scientific society.

The diaphote consists of four essential parts, the receiving mirror, the transmitting wires, a common galvanic battery and the reproducing speculum. The Doctor gave a detailed account of the many experiments undertaken to determine the proper composition and arrangement of the mirror and speculum. In the diapbote exhibited, the mirror was 6 inches by 4, and had 72 fine wires, which were gathered together in one about a foot back of the frame, the whole being finely wrapped with an insulated covering, and on reaching the receiving speculum each little wire was connected to a division similarly placed as in the mirror. From a common galvanic battery wires also ran to each diapbotic plate, and thus a circuit was formed which could be closed or not at pleasure. The theoretical action of the instrument appears now to be the following: The waves of light from an object are conducted through the ordinary camera, so that they fall on certain of the divisions of the mirror when the electric circuit is closed. The light and accompanying heat produce momentary chemical changes in the amalgam of the mirror—which consists of a peculiar compound of selenium and chromium. These changes modify the electric current and cause similar changes in the corresponding partitions of the remote speculum, thus reproducing a similar image, which, by a second camera, may be readily seen by the eye or thrown upon a screen. Dr. Licks explained how the proportions of selenium in the mirror and speculum should be scientifically adjusted to the size of the divisions and the resistance of the electric circuit, so as to avoid any blending of the portions of the reproduced image. This, he said, had been the problem which had caused him the most difficulty, and which at one time had seemed almost insurmountable.

At the close of the paper an illustration was given of the powers of the instrument. The mirror of the diapbote, in charge of a committee of three, was taken to a room in the lower part of the building and the connecting wires laid through the halls and stairways to the speculum on the lecturer's platform. Before the mirror the committee held, in succession, various objects, illuminating each by the light of a burning magnesium wire, and simultaneously on the speculum appeared the secondary images, which for exhibition to the audience were thrown on a screen considerably magnified. An apple, a penknife and a trade dollar were the first objects shown; on the latter the outlines of the Goddess of Liberty were recognized, and the date of 1878 was plainly legible. A watch was held five minutes before the mirror, and the audience could plainly perceive the motion of the minute hand on the screen, but the movement of the second hand was not satisfactory seen, although Prof. Kannich, by looking into the camera, thought that it was there quite perceptible. An ink bottle, a flower and a part of a theater bandbill were also shown, and when the head of a little kitten appeared on the screen, the club testified its satisfaction by the most hearty applause. After the close of the experiments the scientists extended their congratulations to Dr. Licks, and the President made a few remarks on the probable scientific and industrial applications of the diaphote in the future. With the telephone and the diaphote it might yet be possible for friends, separated by the wide Atlantic, to bear and see each other at the same time; to talk, as it were, face to face.

HARNESSING ELECTRICITY.—Mr. W. H. Barlow, the new President of the Institution of Civil Engineers, London, in his recent inaugural address, speaking of the rapid growth of telegraphy and other practical applications of electricity, said that the diminution of power, from increased length of the conducting wire, had been surmounted by relays of power at fixed stations. (This was the discovery of Morse.) By employing this ingenious expedient on the Indo-European Telegraph, Calcutta had frequently been put in direct communication with London, a distance of 7,000 miles. He further stated that Dr. C. W. Siemens had ascertained that in employing electricity for the transmission of power, including all sources of loss, 50% of the original power could be realized by electric wires at a distance of one mile from the motor; and that with adequate provisions against heating it would be no dearer to transmit electro-motive power to a greater than to a smaller distance. Sir William Armstrong, by means of an electro machine and wire, works his circular saw at a distance of a mile from the water wheel that turns the electric machine. By the same means Dr. Werner Siemens works a locomotive that carries thirty persons.

Recent Progress in Chemistry.

Professor Dewar, F. R. S., Jacksonian Professor in the University of Cambridge, England, lately commenced a course of sight lectures on "Recent Progress in Chemistry," at the Royal Institution, London, where he fills the chair of that science. In his first lecture he dealt with the advances in chemical theory made good by the two main lines of attack on the mysteries of chemical action. These were—first, the hypothesis that matter is constituted of molecules in motion, whose structure and action may be ascertained from the investigation of sensible masses of matter; and the other, or modern method, which was based solely on the two fundamental laws of physical action, namely, the conservation of energy and its general tendency towards dissipation. Thus, chemical science, so long statical, had now an extensive dynamical literature, as an admirable example of which was mentioned the lately published work of Professor Berthelot, of Paris, entitled "*Essai de Mecanique Chimique, fondee sur la Thermochimie.*"

The lecturer then proceeded to illustrate the great advance in our knowledge and in our power of manipulation of high temperatures, referring to the immense industrial advantages derived from the introduction of Siemens' regenerator into all chemical manufactures involving the necessity of using furnaces at white heat. He proceeded to show that the recent introduction of magneto-electric machines enabled chemists to examine the interaction of bodies at temperatures far above that of any flame, which never exceeded 3,000°. With this view he showed, for the first time in public, experiments of his own. As an instance may be given his raising a carbon tube inclosed in lime by means of the Siemens electric arc to so high a temperature that the intensely heated part of the tube became changed into graphite, and by passing a mixture of equal volumes of hydrogen and nitrogen through this tube he formed prussic (hydrocyanic) acid by the direct union of carbon, hydrogen and nitrogen. He thus proved that this exceptional chemical combination is not brought about by any occult electrical effect caused during the transit of the electricity in the arc, but that it is the result of the exceptionally high temperature of the carbon in presence of the gases. The old doctrine of chemical affinity had, in fact, been so far modified as to accord with a mechanical definition, which might be thus formulated: That if two or more compound bodies are capable of reacting chemically to form new substances, then that substance will be formed which, *par excellence*, is attended with the greatest dissipation of energy—*i. e.*, with the greatest evolution of heat.

Further experimental illustrations were given of apparent anomalies in chemical decompositions brought about by the passage of electric currents through fluids. Thus it was publicly shown for the first time that acidulated water, which is readily decomposed into hydrogen and oxygen by the current of a single pair of voltaic cells, was yet seemingly quite unattacked by the passage of the powerful intermittent current of De Merritens' magneto machine, which has a power of, say, 50 cells of Grove's battery This, it was explained, was due to the superposition of alternate layers of hydrogen and oxygen at the poles something like 300 times every second under the most favorable conditions for chemical recombination. The apparent absence of decomposition could only be explained by the constant interchange of decomposition and recomposition. This was demonstrated by the use of the telephone, which revealed a rapid intermittent current passing through the cell, and further by the continuous rise in temperature of the contents of the cell. The lecturer proceeded to deal with the allotropic modifications of bodies, which branch of the subject he proposes to continue in his next lecture.

HUNTING BY ELECTRICITY.—A new application of the Ruhmkorff coil has been made in the neighborhood of Marseilles. Instead of using bird-lime on trees which are frequented by birds of passage, a copper wire is wound around the trunk and a decoy attached to a neighboring staff. When a numerous flock has been attracted by the decoy, a shock is sent by the commutator, and they are more surely stunned than by a rifle. Experiments of a similar kind have also been made by M. Dalmas upon the vines at his country-seat, and powerful shocks are said to have destroyed the parasites together with their eggs. If this statement is confirmed, the ingenious inventor may reasonably expect the prize of 100,000 francs, which has been offered for the destruction of the phylloxera.—*Les Mondes.*

PREDICTION OF HARVESTS.—Herve Mangon has examined the climatological conditions of the years from 1869 to 1879, in Normandy, and their influence upon the ripening of the crops. He gives three tables of the amount of heat received by different grains between planting and harvesting, and draws two important practical conclusions: 1. In a mild and regular climate it is generally desirable to sow the crops early in the fall. 2. By observing each year the amount of heat received subsequently to planting, and by consulting properly prepared tables, it is possible to calculate a month or six weeks in advance the time of harvest. In his own tables he fixed upon 6° C. (42.8° F.) as the growing limit, and recorded the number of degrees at each observation above that limit.—*Comptes Rendus.*

Mining Share Market.

Supreme dullness has prevailed throughont the week. All attempts to force a rise npon the market have been signal failures. This must be the resnlt of the impecnniosity of outsiders which prevents them from accepting the offers of fortunes, which are so freely presented to their notice. Another, and a powerful canse, is to be fonnd in this legislative tendencies of obstructing all mining operations by the threatened enactment of statutes with such objectionable features as would, if put into execution, result in the destruction of the mining stock business. When this incubus shall have been thrown off, there cannot fail to arise a more prosperous and healthy condition in mining matters. The mines themselves, so far as this State is concerned, have never evinced a more solid and lucrative status than they now do, aod if the state of the market was solely dependent upon them, it would be in a very active and extensive routine of operations. Outside capital stands ready to invest in our mines as soon as these vexed questions of law inflictions are sct at rest. With rich mines, genial climate and remarkably favorable accessibility, our mines are sure to meet their due recognition from men of means when no impedimeuts stand in the way of a just and free development of them.

It may be noticed, in this connection, that the New York *World* of the 24th inst. says that that day the mining share market in New York was a very active one, the sales amounting to 102,000 shares, against 77,000 shares on the day previous. It is pretty well settled now that the mining stock business of the country will hereafter be at New York. It is not probable, however, that all the bad features which existed here will be countenanced there.

We see also that Leadville has started a mining and stock exchange. The object is, as stated by the circular, to "ascertain and fix the value on gold, silver and other meritorious mines in Colorado; to place upon the market and aid in the sale of good mines and mining stocks." That is a good idea making a distinction between mines and mining stocks.

Bullion Shipments.*

Since onr last issue, we have noticed the following hullion shipments:

Alexander, Mar. 8, $2,060.85; Mar. 10, $1,043.25; Mar. 12, $1 278.22; Horn Silver, Mar. 16, $4.858; Mar. 17, $13,842.75; McCorkindale Co. received of Horn Silver hullion: Mar. 1 to 16, 103,424 lbs.; Mar. 18, 32,710 lbs.; Mar. 19, 19,881 lbs.; Christy, Mar. 15, $1,497.12; Mar. 16, $2,164 47; Mar. 17, $2,111.42; Mar. 20, $2,277.41; McCormick & Co. received Mar. 15, $8,550; Mar. 16, $9,650; Mar. 18, $6,450; Mar. 19, $18,250; Mar. 20, $4,450; Barbee & Walker, Mar. 15, $1,726 90; Mar. 17, $3,764.55; Paradise, Mar. 15. $4,089 36; Bodie Con., Mar. 15, $6,318; Mar. 22, $5,317; Northern Belle, Mar. 15, $8,413.62; Mar. 17, $7,849 38; Standard Con., Mar. 15, $45,835 96; Bulwer Con., Mar. 15, $10,900.52; Wells, Fargo & Co., at Eureka, Mar. 18, $6,711.72; Mar. 21, $1,000; Wells, Fargo & Co., at Pioche, Mar. 20—for one week $4,238.41; Grand Prize, Mar. 22, $6,000; Con. Virgioia for March, $55,087.50; Stewart, Mar. 19, $7,000; Richmond, Mar. 20, $20,900; Silver King, Mar. 14, 10,700 lbs. concentrations; Tiger, Mar. 14, $8,000; Eureka Con., Mar. 21, for one week, 186,865 lbs.

*Desiring to make our list of Bullion Shipments as complete as possible, we will he thankful to receive from mining Superintendents and Secretaries notice of all bullion shipments from their respective mines.

"THE CALIFORNIAN."—The April number of the new San Francisco magazine is before the pnblic. The *Morning Call*, in speaking of it, says: "In its attractive table of contents we regret to note the almost entire absence of the female element—hut one or two articles of the more solid dishes being credited to lady authors. This ought not to be, when we have so many capable and brilliant writers of both prose and verse of the gentler sex in onr midst. Let them come forth and show themselves, and not permit their sturdier hut not more accomplished brothers to bear all the hurdens and carry off all the honors, if such are achieved, in launching this literary venture upon the sea of popular opinion. In the light and lively "outcroppings," however, we recognize the deft fingers and lively intellect of several of our well-known female authors, Miss Clifford's pleasant little paper on "Pets," and some of the pieces of verse in this department being especially graceful and readable. Mrs. Ludlum's "Captain Molly" is an excellent specimen of story writing, and Miss Manning discourses in quite charming style of life at "Agua Tihia." Edgar Fawcett contrihntes a thoughtful essay on "Americanism in Literatnre;" and without going into further detail we merely remark that the current nnmher shows in many respects a marked and gratifying improvement in the magazine.

Mining Summary.

This following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

QUARTZ MOUNTAIN.—*Ledger*, Mar. 20: Thero is a great activity around this uline at Lower Rancheria. It is, as its nams implies, a mountaiu of quartz. Although the rock gives fair assays, it has been found impossible to work it to advantage by ordinary mill process. Thoy are putting up a roasting furnace, believing by that means the rebellious character of the ore may be overcome.

ZIBLE.—Twenty-five stamps are running, the supply of water being inadequate to run the full capacity of the mill. In a week or so connection will be made with the Moors ditch, when everything around mill and mine will be in full operation.

BUTTE.

FIRE.—*Register*, Mar. 19: The Banner quartz mill was discovered to be on firs Wednesday morning about one o'clock. The alarm was given at once, but no efforts of those present could suppress the flames, and the result was it burned to the ground, probably rendering the machinery worthless. It cost, with the machinery, $15,000. It was set on fire.

CALAVERAS.

A BONANZA MINE.—Lodi *Review:* A rich quartz mine has recently been discovered in the Iron mountain, two miles south of Lane's springs. It is called the Mattie mine. Several pans of the casings washed yielded from 20 to 60 cents to the pan in gold. Two or three assays of the rock have been made, which run away up into the thousands.

ANOTHER DISCOVERY.—*Advertiser*, Mar. 18: Mr. Due, while prospecting on Murray's creek, about a mile from the Rodiscino mine, discovered a fine ledge of rich quartz. The ledge at present is two ft in width, being in the slate belt, and, judging from specimens shown us, which were immensely rich, it will no doubt pay well.

DOLAN & COGSWELL.—*Mountain Echo*, Mar. 10: Is a mountain of ore, which yields from $5 to $10 a ton. The ore has been worked in arastras, always paying good wages. The owners have erected a 10-stamp mill, and find hy milling their ore that they can save a much larger percentage of gold than hy the former process.

EL DORADO.

THE SILVER MINE.—*Mountain Democrat*, Mar. 20: Later reports are even more flattering than those first received from the silver mine in Kelsey township. Samples of ore, taken from the point of junction of the north and south with the east and west ledge, yielded at the rate of $82.25 in gold and $59.80 in silver. Some of the former tests yielded $159 per ton in both metals, hut the one above noted was on a larger scale and conveyed a better assurance of general results from the treatment of the ore by mill process. The later tests leave but little room to doubt that thousands of tons can be mined from these ledges at comparatively insignificant cost, that can he depended on to yield from $50 to $75 by ordinary mill process.

MARIN.

RICH MINE IN NICASIO.—San Rafael *Journal*, Mar. 18: Mr. C. Murray, of Nicasio, has a superh mining prospect on his ranch, a mile northeast of the Nicasio hotel, from the croppings of which some splendid assays have been made. The ledge haa been traced for two or three miles. A piece of ore assayed $47.14 to the ton.

MONO.

STANDARD CON.—*Chronicle*, Mar. 15: The new shaft is down 819 ft. Tho north drift from the cast crosscut, 500 level, is in 105 ft, making a progress for the week of 15 ft. The upraise from the south drift is up 80 ft. The ledgo is five ft wide of rich ore. The upraise on the Cook ledge is up 80 ft, with a ledge two and a half ft wide of good milling ore. The north drift, east ledge, 300 level incline, is in 209 ft; the ledge is two and a half ft wide. The south drift from the west crosscut is in 230 ft, with a ledge three ft wide of fine ore. On the 385 level, north of the crosscut, they have the hanging wall. The vein is 78 ft wide, all ore except five ft of "horse" at the center. In the West Standard stopes the ledge is five ft wide, with no change to oote.

JUPITER.—On the 500 level the west crosscut from the main shaft is in 137 ft, and the west crosscut from south drift No. 2 is in 85 ft. In both, the character of the ground is much improved.

BULWER CON.—The north drift on the Ralston ledge has a total distance from the tunnel of 103 ft. The ledge is three ft wide and looks well. The south drift is in 100 ft. The ledge is two ft wide of good ore. In the south drift on the Ralston vein they are stoping from a ledge three and half ft wide of good ore.

SUMMIT.—The north drift, 531 level, is in from the shaft 145 ft, showing a vein two ft wide. Tho upraise from this drift 93 ft south of the sbaft, is up 52 ft. The ledge is two and a half ft wide.

BELVIDERE.—Tbo joint south drift is in 100 ft. The ledge in this drift has a width of four ft. The main west crosscut is in 96 ft. The south drift is in 39 ft, and the ledge is four ft between the walls, carrying from 18 inches to two ft of good milling ore. The north drift from the top of the upraise has been extended the ledge 23 ft north of the shaft, showing four and a half ft of clean ore.

DOUBLE STANDARD.—The north drift is in 10 ft from the crosscut, showing a vein three ft wide of good ore. The south drift has a ledge in the face two and a half ft wide. Samples from both the drifts show au average assay of $48.55 per ton.

ADONOA.—Bodie *News*, Mar. 21: The new shaft is down 295 ft. The formation is a soft, gray porphyry, containing seams of bright, lively quartz. The shaft is expected to cut the main Addenda ledge at a depth of 550 ft.

GOOSEBAR.—The station at the 600 level is completed and croscutting for the veins cut on the 450 level has commenced. The winze on vein No. 2, 450 level, is down 135 ft. There are four ft of ledge matter and two ft of good ore on the bottom. A circumstance of peculiar significance on this level and in the winze is that veins 2 and 3 are only 16 ft apart, and pitching towards a common center, and every indication goes to show that these two ledges must come in contact and unito very soon. At the 000 level the crosscut will cut these veins.

UNIVERSITY.—The shaft is down 417 ft. The rock in the bottom is of a good working character and improving daily.

SOUTH NOONOAY.—Drifting north and south on the vein has commenced. The ledge in both drifte ie looking well. The pay stratum is three ft wide, and the ore gives good assays. About three tons are hoisted daily.

NORTH BULWER.—The shaft is down 75 ft. At 70 ft a fine ledge was cut, seven ft wide, with clean-cut walls, carrying one seam of rich ore that gives fahulous assays. In addition, the fissure carries vein porphyry with seams of bright, lively quartz and clay, giving good assays.

SOUTH BULWER.—*Free Press*, Mar. 19: They have completed cutting out station at 550 level and commenced crosscutting east toward the Miller ledge, passing through hard, iron-stained porphyry, and at present have a large flow of water coming in from the face of the crosscut. Every indication points toward a speedy intersection of the ledge passed through in the shaft at a depth of 530 ft. The west crosecut, 500 level, is in 20 ft.

BLACKDAWK.—The shaft is down 690 ft, and the hottom is now in hard rock. The small veins that have been following the shaft continue and show a slight improvement. A station will be opened at the 700 level, and crosscuts east and west will he started. The winze on the 320 level is down 85 ft, the rock being hard. The vein is 20 inches wide.

QUEEN BEE.—The north drift on the 400 level is in 220 ft. Theontire width of the drift is in a ledge of fine milling rock. West crosscut, same level, 200 ft north of east crosscut, is in 31 ft. East crosscut, at the same point, is in 33 ft.

BODIE TUNNEL.—A ledge of good millling ore has been cut, four ft wide. The winze at the 1000 station is down 18 ft, showing a strong, well-defined ledge, averaging assays of $30 in gold.

ORO.—The west crosscut, tuunsl level, is in 240 ft, the face still continuing in low-grade quartz and porphyry. The main shaft is 100 ft below the first level: total depth, 330 ft.

NEVADA.

SPANISH.—*Transcript*, Mar. 15: Is situated near the Nevada City and Merrifield mines, and it is claimed to be on the same lead as the latter. It has a tunnel 350 ft long, with a 375-ft drift along a three-ft ledge, with good ore in the face. It has produced altogether about 500 tons of ore. One hundred tons extracted last year paid at the rate of $15 per ton.

PHŒNIX.—Has been lying idle for three years, and was recently relocated by agents of the Phœnix company, of New York. The original holders sauk an incline over 300 ft deep and ran several hundred ft of levels. They also ran a drain tunnel 1,200 ft, intersecting the incline 200 ft below the surface. Several hundred tons of ors, paying from $15 to $60 a ton, have been taken out.

THOMAS.—Has been worked on the surface since 1852, and always paid. The incline is now below the 650 level, and now pumps are being put in. One chute of ore on the bottom level has been drifted 050 ft. The ledge is two ft thick, and of high grade all through. There are frequently found in the ledge bodies of several hundred pounds of ore that pay at the rate of $25,000 or $30,000 a ton. The average daily output at present is about 18 tons.

MOHICAN.—A crushing of 42 tone yielded in free gold $1,066.18, besides four tons of sulphurets assaying $83.65 a ton. The average yield per ton was therefore about $30. Most of the ore was taken out in sinking the shaft, which is 140 ft deep, and from the 120-ft east drift. There are 60 tons of the same character on the dump. The first crushing paid $12.50 a ton; the second, $14.57; and, as we have shewn above, the last shout $30.

LECOMPTON.—In its early days this claim produced, above water level, some $225,000, and paid $70,000 in dividends. The ledge varies from six inches to one and one-half ft in thickness, and is exceedingly rich.

PROVIDENCE.—The lodging is down 1,023 ft. Thero have been developed, between the 500 and 1000 levels, several chutes of ore, the existence of which was not previously known. The work done thus far has been mainly for the purpose of development, only about 40 tons of ore per day being hoisted. The result is that the owuers have in sight enough ore to run the present 20 stamps for 20 years without opening another foot of ground. There are being worked five distinct parallel ledges that are from 3 to 14 ft thick. The ore is very rich in sulphurate and free gold. The new incline, 1,700 ft south of the present one, is down to the 000 level. It is proposed to increase the present mill capacity of 20 stamps to 60 or 80 stamps this spring, and hoist from both inclines, thus being able to turn out about 150 toos of ore a day. There are very extensive chlorinstion works connected with this property.

KINOSSURY.—Is on Little Deer creek, half a mile east of the city. It has a 120-ft shaft, and the tunnel is 500 ft long. The ledge averages about 14 inches. The ore has averaged from $12 to $16 a ton, and there are about 1,000 tons in sight in the backs.

EL CAPITAN.—Have sunk the incline 150 ft and run north and south drifts a distance of 400 ft. The fissure is 00 ft wide on this level. Ore bas been found in both drifts, the ledge heiog two ft thick. Ahout 150 tons has been taken out.

COLD SPRING GRAVEL.—An incline has been sunk 400 ft and the channel drifted 600 ft. Some good gravel was taken out, but the expenses of hoisting and pumping were so heavy that a tunnel was started, which is in 450 ft, and will have to be exteoded 900 ft further. The company have expended about $20,000 in the development of their claim, which coneists of 425 acres held under a patent.

NEW YORK.—Consists of 120 acres of patented ground on Deer creek, two milea from the city. There are six ledges, varying in thickness from two to six ft. The lead on which the hoisting works are erected is supposed to he a continuation of the Big Blue, from which the Murchie company has taken so much money. There is free water for hoisting nine months in the year. There is a 10-stamp mill on the ground.

WYOMING.—The incline is down 500 ft, with drifts north and south. The ledgo is 2 to 10 ft wide, and 6 men stoping keep 10 stamps huey. The lower main tunnel is being extended along the ledge to the north.

OMBOA.—Owns a half section of land, on the channel, of gold-bearing gravel at Omega, together with a ditch and water right, and work their claims hy the hydraulic process. The present company has been operating for about 10 years, taking out from $60,000 to $100,000 of gold hullion per annum. The mine has a bright future, as a large portion of the claim is yet untouched.

SAILOR FLAT.—This mine is owned hy practical miners who, although working on a limited scale, produce from it a sum approximating $50,000 per season.

PITTSBURG.—Orass Valley *Union*, Mar. 21: An important development has heen made, striking a new pay chute on the 800 level north, 350 ft from the sbaft. The ledge is from 10 to 20 inchee in size, carrying well in heavy sulphurets, galena and free gold. This is a distinct chute from any ever before discovered, and hids fair to add greatly to the previous value of the mine. On the same level, 300 ft south of the shaft, or 750 ft distant from where the fine rock has been struck, a winze has been sunk, which opened a ledge of high grade ore, being between two and three ft in eize, and milling from $80 to $100 per load. From this it will he seen that the Pittaburg has two distinct pay chutes, both rich.

MINING ITEMS.—*Herald*, Mar. 18: The North Bloomfield company have heen running 1,500 ioches of water through the winter, and have kept a large force of men employed. The Eagle gravel mine, at Relief hill, is commencing work on a more extensive scale. A quartz ledge two ft in thickness was discovered on Picky hill. After sinking to a depth of five ft a ledge of two ft in thickness was struck. They have now reached a depth of about 10 ft, and the vein still continues to hold out well. It prospects from one to two bits a pan.

NEVADA.

WASHOE DISTRICT.

OPHIR.—Virginia City *Enterprise*, Mar. 21: On the 2500 level the main drift has a total length of 278 ft from the incline. The east drift is now 200 ft from the station. On the 2300 level the joint Mexican east crosscut is in 200 ft from the main north drift. East crosscut No. 1 is in 68 ft from the north drift in the Hardy vein. On the 2200 level the north drift in the Hardy vein is in 172 ft from the main north drift. On the 2100 level winze No. 2 has been sunk and timbered to a depth of 11 ft, and shows good milling ore in the hottom. The drift north from the bottom of No. 1 winze is in 32 ft.

YELLOW JACKET.—The north winze lacks hut 10 ft of being down to the 2900 level. The west crosscut, 2700 level, is in 184 ft. They are placing a diamoud drill at the hottom (2,863 ft doep), to learn whether they are likely to meet any quantity of water when sinking is reamed.

UNION CON.—On the 2300 level the joint Mexican crosscut on the southern boundary is in 224 ft from the main north drift. On reaching a point 305 ft from the north drift a joint Mexican winze will bo sunk on the 2500 level. On the 2400 level winze No. 1 has a total depth of 48 ft, the hottom showing some ore giving low assays. The south drift is now 356 ft from the Union shaft, the face showing porphyry carrying some quartz. The Union shaft has been sunk and timbered to a point 65 ft helow the 2400 station.

SILVER HILL.—The face of the 1300 crosscut is in ledge material with streaks of low-grado quartz; it looks well. Forty-two ft have been excavated and timbered the last week. The south drift has heen extended 35 ft. It is still west of the quartz found in the crosscut.

CALIFORNIA.—During the past week thoy have hoisted 201 tons of ore. Oo the 1500 level the west crosscut is now in 147 ft from the main drift. On tbo 2100 level the raise is up 19 ft, passing through vein formation carrying some quartz. On the 2400 level the joint consolidated east crosscut on the southern boundary has a total length of 190 ft. At the C & O shaft they have reached the 2300 station, and the set is being put in place. The bottom continues in vein material with some quartz.

CON. VIRGINIA.—During the past week 864 tons of ore have heen extracted from the 1550 and 1750 levels. On the 2000 level the joint Best & Belcher east crosscut has a total length of 250 ft. On the 2200 level the joint California east crosscut, on the northern boundary, is in 190 ft, and continues in vein material with streaks of quartz.

JULIA CON.—The south lateral drift on the 2000 level is in from the west crosscut 209 ft. They have 58 ft to drift to connect with the east crosscut, which is advancing on tbis level from the winze sunk from the 1850 level. Tue east crosscut from the winze is in 68 ft.

UTAH.—The incline is now 300 ft below tbo 1750 level and six ft below the 1050 level, on the slops. On tbo 1750 level the south lateral drift is in 255 ft. The east crosscut on this level is in 247 ft.

MEXICAN.—On the 2300 level the joint Ophir crosscut on the northern boundary is in 206 ft from the main north drift. The joint Union Con. crosscut on the northern houndary is in 224 ft from the main north drift.

SIERRA NEVADA.—The north drift on the 2300 level is in from the east shaft 594 ft. The crosscut east, at a point 500 ft north of the east shaft, was continued through the clay lining on the east side; total length of crosscut, 144 ft.

BELMONT DISTRICT.

BARCELONA CON.—*Courier*, Mar. 13: In tbe 75 level what was formerly supposed to be the footwall of the ledge was blasted into and a hody of rich chloride ore was found which assays from $135.07 to $2,190.24 per ton. The deposit seems to increase in size and value as the work progresses. This is the same character of ore which formerly milled $745.16 per tou.

SOUTH BARCELONA.—Latest assaye gave $175.93 and $182.11 per ton. The main tunnel when completed will drain the whole works 450 ft from the surface.

DANVILLE.—They have extracted a quantity of ore which assays $1,200 per ton.

JEFFERSON.—The fine ore body in the 700 level probably extends to the Prussian. A joint shaft on the Jefferson side of the mountain would cut the ledge at a depth of from 300 to 400 ft.

LIBERTY.—Is at San Antonio. After sinking 150 ft helow the fault and crosscutting 130 ft easterly, a fine vein of black sulphuret ore 10 ft thick was cut through.

BRISTOL DISTRICT.

HILLSIDE.—Pioche *Record*, Mar. 20: The fourth, fifth and sixth levels, east, are all in ore, the fifth level being in 200 ft from the main incline, carrying five ft of ore of the average assay value of from $40 to $70 per ton. The ore body west, in the main fissure, is carrying a good deal of high-grade ore. A crosscut into the hanging wall 40 ft opened up a four-ft vein of splendid yellow ore running high in silver. The winze sunk below the seventh level is in high-grade ore. Is shipping 25 tons of ore daily to this furnace.

ESMERALDA DISTRICT.

BELOINO.—*Herald*, Mar. 20: Is located at Candelaria; is an eastern extension of the Creolo, and runs in an easterly direction 1,500 ft. Tho company has two claima, tbe Palm Flush and the Side Issue. The width of the ground is 400 ft. A shaft has been sunk 80 ft, which cut a fair looking vein near the surface.

EUREKA DISTRICT.

RICHMOND.—*Sentinel*, Mar. 19: In the drift from the rise in the hack of No. 15 chamber the ore is narrow, hut the seam is regular. The 500 north from the hottom of No. 15 has heen drifted 40 ft, in very fine ore. The 500 west from No. 12 chamber is favorable for ore. No. 15 is opening out a very fine hody of ore; they have crosscut in the lower part of the chamber, and find the ore to he 30 ft wide, with ore still in the end of the crosscut.

BONANZA CON.—Is locatel southeast of the Jackson. The propert consists of four parallel locations, of 1,500 ft each, namely: the Star of the West, Nos. 1 and 2, and the Pride of the West, Nos. 1 and 2. The immense ore hodies of the Jackson are known to trend in the direction of the Bonanza Con. The ore also crops to the surface at several points within the consolidation. A main shaft is down 150 ft, from which point 300 ft of drift has been run, encountering the most encouraging prospects.

REBEL CREEK DISTRICT.

MINING ITEMS.—*Silver State*, Mar. 15: The incline on the Ohio mine is down 120. The ledge is from 10 to 14 ft wide, and tbo ore will average over $200 per ton. Among the other mines discovered aro the North Star, the Moonlight, the Columbus and the El Dorado, each and all of which carry good ores. Samples of the North Star assayed $100 per ton in silver. Mr. McKinney has a fine prospect near Buffalo station, on which the ledge is six ft wide and the ore assays from $50 to $100 per ton.

WINNEMUCCA DISTRICT.

BULLION BEE.—*Silver State*, Mar. 19: Samples taken from the ledge assayed $40.08 and $22.02 per ton in silver. The ledge is 30 ft wide, and the samplea assayed were an average of the ore.

ARIZONA.

OLOBE DISTRICT ITEMS.—*Silver Belt*, Mar. 13: An assay from the Lizzie Emier, Bluebird hill, gave 223 ounces to the ton. The McCormick crosscut at a depth of 250 ft is in vein matter 100 ft, 80 of which is pay ore. Mamie Miller, eight miles south of Globe, carries gold vein upwards of a foot wide, and assays from $50 to $300 per ton, has a 22-ft tunnel and 10-ft shaft. The Mahle, on same belt, is small, hut exceedingly rich in gold, has two veins, each varying from two to four inches. The Mattle Orr, nine miles south of Olohe, also a gold vein, assays $50 to $300, has a 40-ft tunnel and a 12-ft shaft. The vein is 12 inches wide. A four-ft hody of ore has heen developed in the Alhert Lea at a depth of 35 ft, all in ore assaying from 100 to 500 ounces.

OLOEN EAGLE.—Is located six miles from Globe. The first week's work, in one shaft, brought enough gold to pay all hands employed about the mine for 30 days, and in one day six tons of ore, assaying $130 to the ton in gold, were hoisted to the surface. The ore literally glistens with gold. The purchase money as well as the cost of labor on the mine has heen taken out within the last two months.

GOLDEN STAR.—Is situated on what is claimed to be the mother lode, which is traceahle and located for 7,500 ft. A year ago a combination tunnel was run hy the Golden Gate and Golden Star, which at the distance of 170 ft, struck the ledge at a depth of 120 ft, and it carried native gold in quartz. The last ore worked brought $52 in gold and $18 in silver.

EUREKA.—This claim adjoins the Golden Gate. The ore worked yielded $00 in gold and $20 in silver.

YELLOW METAL.—This property seems to carry off the palm for rich surface croppings, the same assaying $103 in gold and $44 in silver. A tunnel is heing run which will strike the ledge at a depth of 75 ft. It is already in 100 ft and will soon reach the vein.

MOUSER.—Several shafts have heen sunk, invariahly showing ore, which by dry-washing never fails to reveal grains of gold and assays $100 to the ton.

BELMONT.—*Citizen*, Mar. 20: This was the first mine opened in Patagonia district, having heen worked in 1865 and 1866. The shaft is down 115 ft, from which there are three crosscuts, at 40, 70 and 110 ft, running in the vein, 15, 20 and 35 ft respectively. The ledge contains free milling ore.

FINE SPECIMEN.—We were shown a rare specimen of white or clouded chloride of silver intermixed with horn silver, which was taken from the Ophir mine, in Empire district. They are down 28 ft on the ledge and have a vein eight ft wide, the seam from which the ore referred to came, heing from 6 to 10 inches wide.

COPPER DISCOVERIES.—Some very promising copper

CONTINUED ON PAGE 204,

Mineral Lands.

Proposed Change in the Manner of Locating.

The following is the full text of chapter XII, of the bill introduced into Congress by Mr. Converse, to provide for the survey and disposal of ths public lands of the United States. This chapter relates to the location of minsral lands, and is as follows:

Sec. 167. That the public lands of the United States, classified by law as mineral lands, shall bs reserved from sals or disposal, expect as expressly directed by law.

Sec. 168. That all valuable mineral deposits in puhlic lands of ths United States, both surveyed and unsurveyed, are hereby declared to be free and open to exploration, and surface and subterranean prospecting. The lends in which such mineral deposits are found shall be open to occupation and purchase by citizens of the United States, and those who have declared their intention to become such, upon the terms and conditions hereinafter prescribed.

Sec. 169. That any mining claims located after the —— day of ——, 1880, sball bs bounded as to surface by straight line, and all right to minerals contained therein shall be confined within vertical planes passing downward through said straight boundary lines.

Sec. 170. That a mining claim located after the——day of——may equal but shall not sxceed a square of——feet on the side, and the same may be in any shaps, so that neither length nor breadth shall exceed——feet, nor the aggregate area exceed that of the square hereinbefore first described.

Sec. 171. That proof of citizenship under this chapter may consist, in the case of an individual, of his own affidavit thereof; in the case of an association of persons unincorporated, of the affidavit of their anthorized agent, made on his own knowledge or upon information and belief; and in the case of a corporation organized nnder the laws of the United States, or of any State or Territory thereof, by the filing of a certified copy of their chartsr or certificate of incorporation.

Sec. 172. Tbat all future occupation, location or purchase of public mineral lands shall be governed by laws of Congress, to the exclusion of all local customs and regulations and State or Territorial laws.

Sec. 173. That no title, or valid claim to title, to public mineral lands eball be acquired as against the United States or third parties, except upon compliance with the following conditions and requirements.

Sec. 174. That any qnalified person may acquire such claim or title:

First—By marking the position of his claim by monuments upon the ground and by posting notices thereon. Said monuments shall consist either of firmly-set wooden stakes, not less than six inches square and not less than four feet above ground, or of well-set piles of stones, not less than four feet square at the bass and not less then three feet high, posted at each exterior angle of the claim. The northeasternmost monument shall be the initial point for description and survey, and shall be conspicuously marked "O." Said notices shall, within five days from the establishment of ths monuments, be posted conspicuously upon each of said monuments, and, in addition thereto, at least three of said notices shall be posted upon conspicuous places within the interior of said cleim. Said notices shall be dated with the establishment of said monnments, shall describe the exterior boundaries of the claim by specific reference to the monnments established on the ground, and shall note the approximate courses and distances passing southerly, westerly, northerly and eastwardly from the initial monument around the entire boundary closing upon said initial monument. A specific form of notice shall bs prescribed by the Commissioner of tbe General Land Office to embody the foregoing requirements, and be so explicit as to operate as notice to third parties.

Second—By the discovery within said claim of a lode, placer or other valuable mineral deposit, either before the posting of seid notics or within 90 days thereafter.

Third—Within ninety days from the posting of said notice, the locstor shall file with ths United States Surveyor-General for the surveying district in which the claim lies, a copy of said posted notices, together with proof of mineral discovery and an application for survey of his claim, and evidence that he bas deposited to the credit of the United States, in a proper United States depository, the sum of $50, which deposit shall be deemed an addition to the appropriation for the survey of the pnblic lands. Said proof shall consist of affidavits of the locator and of two disinterested persons, and the fact of said mineral discovery shall be subject to such further proof or verification as the Commissioner of the General Land Office may deem necessary. Said application shall be in writing, signed by the locator.

Fourth—Within one year from the approval by the United States Surveyor-General of said survey, the locator, his assigns or his duly authorized agent, has or have complied with the terms of this chapter, shall file in the proper land office an application for patent under oath, showing such compliance, together with a copy of the plat and field-notes of the claim, duly certified by the United States Surveyor-General, and proof that $500 worth of labor has been expended, or of improvements made upon the claim by the claimant or his grantors. Said proof shall consist of ths affidavits of the claimant or bis duly authorizsd agent, corroborated by tbs affidavits of two disinterested witnesses, which shall set forth ths facts in sufficient detail to satisfy the Commissioner of ths General Land Office that the said mineral claim has been worked in good faith. Upon the filing of the application and plat and making the above required proof, and npon payment to the proper officers of —— per acre in fnll for the acreage of his claim, the claimant shall be entitled to a patent for his said claim.

Sec. 175. That the right of assignment of a mineral claim after approval of survey by the United States Surveyor-Gensral is hereby expressly authorized, but such assignment shell confer no right as against the United States, and shall simply substitute an assignee in place of his grantors. No assignment prior to survey shall be recognized.

Sec. 176. That failure by a locator to make application for survey and satisfactorily prove the mineral discovery within 90 days after the posting of the notices shall subject his claim to location by any other qualified party.

Sec. 177. That failure of the claimant to make proof of work and payment within the time hereinbsfore prescribed, shall work a complete forfeiture of the claim, and the survey theretofore made shall be canceled.

Sec. 178. That on or before —, 1880, tbe Commissioner of the General Land Office shall divide the territory west of the 100th meridian into mineral districts, so that eech Surveyor-General's district shall bs made up of one or more mineral districts, having dne regard to the number of survsys of mineral claims and applications for the same.

Sec. 179. That the Surveyor-General shall:

First—Cause to be established in all mining neighborhoods or districts permanent neighborhood or district initial mineral monuments, whicb shall servs as initial refersnce points for mining-claim surveys, and which shall bs connected by trigonometrical measurement with mineral base lines, to be established and meesured by snch methods as may bs prescribed by law.

Second—Hs shall cause to bs determined by trigonometrical measurement the exect course and distsnce bstween said initial district mineral monuments and the hereinbefore-described initial claim monuments.

Third—He shall receive, place on file, and record, in a book kept in his office for that purpose, every application for the survey of a mining claim, together with ths original location notice of the claimant.

Fourth—When two or more locators make application to a Surveyor-General for the survey of the same tract, either in whole or in part, and neither survey has heretofore been epproved, the right to approval shall be in him who mede the first location on the ground; and such priority of location shall, in the first instance, be determined by the officer in the field, and any party aggrieved thereby may, within ninety days after such determination, appeal to the United Stetes Surveyor-General, by whom the question mey be reviewed, upon notice to ths appellee, and after reasonable opportunity for the introduction of proof by both parties.

Fifth—He shall cause some duly appointed deputy mineral surveyor, chosen by the applicant for survey, to execute a survey of each claim for which an application is filed in his office, and to return the plat and field-notes of seid survey to his office.

Sixth—He shall keep in his office connected maps of all mining neighborhoods in his district, upon which shall be shown ths positions of all mineral monuments and the relations to leading topographical features in their immediate vicinity, and the positions of all snrveyed claims which do not overlap previously snrveyed claims, numbering said surveys consecutively in the order of the return of plats and field notes by deputy mineral surveyors. Hs shall ascertain in whatever mode he shall deem most practicable the location of all mining cleims hsretofore surveyed or patented and shall delineete the same upon the connected district maps as accurately as possible. On the return of the said plats and field notes by the deputy mineral surveyor, the Surveyor-General, having cansed the trigonometrical measurement as hereinbefore provided to be made between the nearest initial district mineral monument and the initial monument of the mining claim, shall apply said mineral-claim survey to his district map, and, provided said claim or any part thereof does not overlap any previously applied plat and is otherwise correct, he shall approve said survey and within ten days thereafter shall delineate it upon said district map and make two full copies of said plat and field notes, forwarding one to the Commissioner of tlie General Land Office and the other to the Register of the proper land office. Said district map shall be open to examination by ths public. Copies of all approved surveys shall be furnished to interested parties on payment of costs as fixed by the Commissioner of the General Land Office. If the said Surveyor-General applies any duly returned plat to said district maps, and said plat is found to conflict with or overlap a previously approved survey, said Surveyor-General shall withhold approval thereof, and no legal effect shall attach to the same by reason of its having been made in the field, nor by reason of any approval thereof if the same should inadvertently or accidentally be approved in conflict with prior approval.

Sec. 180. That it shall be ths duty of each Surveyor-General within whose surveying district any minsral survsys have been or shall be made, and within 30 days after sxpiration of ths 10 daye abovs msntioned, to furnish frss of cost, to each district land office and to the Recorder of each county, certified copies of such of said connecting maps as may embracs lands within the limits of said land district or within seid counties, respectively; and copies shall also bs furnished to deputy mineral surveyors at the discretion of the said Surveyor-General.

Sec. 181. That within 30 days after approval of any subsequent survey it shall be ths duty of each Surveyor-General to furnish to each district land offics and to the several County Recordsrs a certified copy of sucb of said subsequent surveys as may fall within said land district and counties, respectively; and the district land offices shall forthwith cause said survey to be immediately delineated in its proper position upon the connecting maps theretofors furnished them.

Sec. 182. That each of said connecting maps shall show in a merginal table the date of approval of the several surveys delineated thereon, and said marginal table shall be regularly continued as subsequent snrveys are added to said connecting maps. Each copy hereinbefore provided for shell also exhibit ths exact date of such approval or approvals.

Sec. 183. Thet in the event that proof of bona fide development and payment of purchasemoney shall not be made or tendered within the year heretofore prescribed, it shall be the duty of the Register of the proper land office to notify the Commissioner of the General Land Offics, who shall forwith cause said survsy to be canceled in all the offices nnder his control, and shall cause notice thereof to be sent to the Recorder of the county wherein the canceled survey was situate. After said cancellation no right or claim of any character shall survive in any party by reason of said survey, and the land embraced therein shall be subject to the claim of any intervening or subsequsnt party, as if no such survey bad ever been mads or applied for.

Sec. 184. That copies of seid connecting meps shall also be furnished to the Commissioner of the General Lend Office, who shall cause the same to be continuously perfected, as hereinbefore prescribed as to other offices.

Sec. 185. That if any Surveyor-Gensral willfully or negligently omits to promptly perform the duties prescribed in this chapter, it shall bs considersd sufficisnt cause for his dismissal from office.

Sec. 186. That if at any time after application for survey, and prior to application for patent, it shall be proved, after personal notice to the mineral claiment, to the satisfaction of the Register of tbe propsr land district, tbat said claimant hes left his surveyed claim with intention of not complying with the provisions of this chapter, the right of said claimant shall cease and determine, after notice in the usual form, to the claimant of said decision by the District Register; and in the absence of appeal to the Commissioner of the General Land Office, the latter officer shall canse the cancellation of ths said survey, as hereinbefore provided.

Sec. 187. That the Surveyor-Generals of the United States may appoint in their respective districts as meny competent snrveyors, furnishing satisfactory evidence of professional capecity, and giving bond in the penal sum of $10,000, as shall apply for appointment to survey mineral cleims. The expense of surveying claims shall be paid by the epplicants, and they shall he at liberty to obtain the seme at the most reasoneble rates; and they shall also be at liberty to employ any United States Deputy Surveyor to make the snrvey.

Sec. 188. That the Commissioner of the General Land Office ehall also have power to establish the maximnm of charges for surveying, and any deputy surveyor proved to have exceeded this maximum shall forfeit his commission, and shall not thereafter be eligible for appointment.

Sec. 189. That all affidavits rsquired to be meds under this chapter may be verified before any jndge or clerk of a court of record, or bsfore any officer authorized to administer oaths, whose official capacity shall be properly verified; and all testimony and proofs may be taken before any such officer, and when duly certified by the officer taking the seme shall have the same force and effect as if taken before the Register of the land office. In cases of contest as to the mineral or agricultural character of the land, the testimony and proofs may be taken as herein provided, on personal notice of at least 10 days to the opposing party, or if sucb party cannot be found, then by the publication of at least once a week for 30 days in a newspaper to be designated by the Register of the land office as published nearest to the location of sucb land, and the Register shall require proof that such notice has been given.

Sec. 190. That all rights wbich have attached to mining claims under previous acts of Congress, shall not be affected by the operations of this chapter: Provided, That where such claims have not been or shall not within one year thereafter be consummated by ths required payment of purchase money, snch unconsummated claims shall lapse, and the land embraced tberein shall thereafter he subject only to the operations of this chapter.

Sec. 191. That where land is used or occupied by the proprietor of a mining claim for mining or mill purposes, such land may be embraced and included in an application for a patsnt for such mining claim, and ths same may be patented therewith, subject to the same preliminary requirements as to survey and notice as are applicable to mineral claims; but no location hereafter made of such mill site shall exceed five acres, and the same mnst be paid for at the same rate as fixed by this chapter for ths superficies of the minsral claim. The owner of reduction works, not owning a mins in connection therewith, may also receive a patsnt for his mill site as provided in this section.

Sec. 192. That as a condition of sale, in tbs absence of necessary legisletion by Congress, the local Legislature of any Stete or Territory may provide rules for working mines, involving easements, drainage and other necessary meens to their complete development; and this condition shall be fully expressed in the patent.

Sec. 193. That whenever, by priority of possession, rights to ths use of water for mining, agricultural, manufacturing, or other purposes, have vested and accrued, and the same are recognized and acknowledged by the local customs, laws and ths decisions of courts, the possessors and owners of such vested rights shall be maintained and protected in the same, and the right of way for the construction of ditches and canals for the purposes herein specified is acknowledge and confirmed: but whenever any person, in the construction of any ditch or canal, injures or damages the possession of any settler on the public domain, the party committing such injury or damage shall be liable to the party injured for such injury or damage.

Sec. 194. That all patents granted, or prsemption or homesteads allowed, shall be subject to any vested and accrued water rights, or rights to ditches and reservoirs used in connection with such water rights, as may have been acquired under or recognized by the preceding section.

Sec. 195. That wherever, upon ths lands heretofore improperly designated as mineral lands, which have been excluded from survey or sale, thers bave been homesteads made by citizens of the United States, or persons who havs declared their intention to become citizens, whicb homesteads have been made, improvsd, and used for agricultural purposes, and upon which thers bave been no valuable mines of gold, silver, cinnabar, lead, coppsr, coal, iron, or other valuable deposit discovered, and which are properly agricultural lends, the settlers or owners of such homesteeds shall have a right to avail themselves of the provisions of chapter sixth of this title, relating to homesteads.

Sec. 196. Upon the survey of the lands described in the prsceding section, the Secretary of the Interior may designate and sst apart such portions of the seme as are clearly agricultural lands, whicb lands shall thereafter be subject to homestead and sale as other publio lands, and be subject to all the laws and regulations applicable to tbs same.

Sec. 197. That the President is autborizsd to establish additional land districts, and to appoint the necessery officers under existing laws, wherever he may deem the same necessary for tbe public convenience in executing the provisions of this chepter.

Sec. 198. That the provisions of the precsding sections of this chapter shall not apply to the minsral lands situated in the States of Michigan, Wisconsin and Minnesota, which are declared free and opsn to exploration and purchase, according to legal subdivision, in liks manner as before the 10th day of May, 1872. And any bona fide entries of such lands within the Stetes named, since the 10th day of May, 1872, may be patented without reference to any of the foregoing provisions of this chapter. Such lands shall be offered for public sale, in the same manner, at the same minimum price, and under the same rights of pre-emption as other publio lands.

Sec. 199. Thet no act passed by Congress, granting lands to States or corporations to aid in the construction of roads or for other purposes, or to extend the time of such grants, shall be so construed as to embrace mineral lands, which, in all cases, are reserved exclusively to the United States, unless otherwise specially provided in the act or acts making the grant.

Sec. 200. That Section 2323 of the Revissd Statutes of the United States, relating to tunnel rights, is hereby repealed.

Sec. 201. That every person above the age of 21 years, who is a citizen of the United States, or who has declared his intention to become such, or any association of persons severally qnalified as above, shall, upon application to the Register of the proper land office, have the right to snter, hy legal subdivisions in a compact body, any quantity of vacant public lands of the United States containing coal and iron valuable for domestic or commercial purposes, not exceeding 320 acres, and not otherwiae appropriated or reserved by competent authority, upon payment to tbe Register of not less than $10 per acre for snch lands.

Sec. 202. That where any snch person or association of persons shall have opened or improved any coal or iron mine upon nnsurvsyed public lands, and shall be in actual possession of the same, such person or association shall bs entitlsd, after snrvey, to a preference right of entry of such lands: Provided, that said entry shall be effected within 60 days after publication of notice of return of the towuship plat to the district land office.

Sec. 203. That the two preceding sections shall be held to authorize only one entry by the same person or association of persons; and no association of persons, any member of which shall have taken the benefit of such sections either as an individual or as a member of any other association, shall hold or enter any other lands nnder the provisions thereof; and no member of any association wbich shall have taken the benefit of such sectione shall enter or hold any other lands under their provisions.

Sec. 204. That in cass of conflicting claims

for the purchase of coal or iron lands, where the right of either party was initiated when the lands were unsurveyed, priority of possession and improvement, followed by continuous and bona fide occupation, shall determine the preference right to purchase; but joint purchase shall be allowable on consent of the parties, or when, in the judgment of the Commissioner of the General Land Office, the conflict was created without notice of any prior claim.

SEC. 205. That nothing in the four preceding sections shall be construed to destroy or impair any rights which may have attached prior to the passage of this act, or to authorize the sale of lands valuable for mines of gold, silver or copper. The Commissioner of the General Land Office is authorized to issue all needful rules and regulations for carrying into effect the provisions of this and the four preceding sections.

THE ENGINEER.

The Piercing of the St. Gothard.

One of the great engineering works of the present century, the piercing of a second great tunnel through the Alps, was carried to a successful issue on the 29th of February, when the workmen from the two ends of the excavations under the St. Gothard were able to shake hands with one another miles away from the surface of the earth. Modern progress in engineering science has stripped such enterprises of much of their uncertainty, and therefore the conception of works like the St. Gothard tunnel appears to us now a matter hardly deserving particular attention. When, however, between 1850 and 1860, an Italian and a Swiss engineer, Locchini and Meuller, first examined the topography of the St. Gothard, and reached the conclusion that the undertaking was practicable, their statements were received with much doubt. Their work was continued by Wetli, and later, in 1863, Dr. A. Escher, prominently connected with the Swiss railroad system, caused more extended and elaborate technical and financial examinations to be made by engineers, whose labors resulted in the recommendation of a tunnel between Airolo, on the Italian side, and Goeschenen, on the Swiss side.

Early in the spring of 1872 bids for the execution of the tunnel were called for. Seven in all were received, of which two only were seriously considered—one made on the part of an Italian company, the other coming from M. Lonis Favre, of Geneva. The latter was accepted on the 7th of August, 1872. It was somewhat modified during the years following, so that the contract price rose to $9,700,000, the time for completion being limited to eight years. The advance heading of the tunnel is all that has been cut through up to this time; the other portions of the work are still considerably behind. As in all large tunnels, the work in the St. Gothard advances in sections. Following the Belgian system, a heading near the top of the arch is driven in advance, and this is followed further back by an enlargement to both sides, bringing out the full section of the upper part of the tunnel. The lower bench is then proceeded with in a similar manner. The tunnel section was thus taken out in two levels at the Goeschenen side, while at the Airolo side three were found to be necessary. Excavation is followed by timbering, and this is succeeded by the arching, so that, entering the tunnel at one portal, each stage is successively passed through.

The dimensions of the St. Gothard tunnel are large enough to accommodate a double track of standard gauge, the width at the level of the sleepers being 24.93 feet, and the hight 19.68 feet. The total length, when completed, will be 9.26 miles—considerable more, therefore, than either the Mont Cenis, the Hoosac, or the Sntro. Although the tunnel passed through hard ground throughout, and at the Airolo end through a wet and difficult formation, its cost was considerably less than that of earlier works of the same kind, owing, to a certain extent, to improved methods of excavation, which also largely reduced the time. The Mont Cenis tunnel, which may best serve to show the advance of modern tunnel work—because cost of labor, etc., were not so widely different—cost $15,000,000, and required thirteen years, while the Hoosac cost $13,000,000, and took eleven years from the time when work was properly begun. It should not be forgotten, in the case of the latter work, that the cost of labor, machinery and materials is vastly greater that it is in the cass of the European enterprises cited.

Among the chief engineering features adopted in the construction of the St. Gothard was the use, almost from the outstart, of rock-drilling by machinery and blasting with high explosives. Experience at the St. Gothard has contributed much toward the introduction of power drills, by the aid of which a monthly advance of from 400 to 440 feet was reached, in rock composed chiefly of granitic gneiss and various granitic and micaceous schists.

The commercial importance of this great work for central Europe cannot be overestimated, while for Switzerland its completion has become a question of vital importance, the piercing of Mont Cenis having diverted much of the traffic to French roads. The St. Gothard railway forms the shortest line of transit between the Mediterranean and the valley of the Rhine, and will be one of the greatest arteries of trade of the Continent, carrying all the transportation and travel between Italy and Switzerland, northeastern France, western and central Germany and northern Europe. It will probably carry the great East India mail between Great Britain and her Eastern Empire *via* Brindisi, Italy and the Suez canal. Two of the great Alpine passes have thus been superseded by the work of modern engineering, and it is only a question of time when Austria will follow the lead of her neighbors and commence the work of piercing the Simplon.

USEFUL INFORMATION.

The Iron of Antiquity.

Soon after the arrival in New York of a specimen of the iron found under the pedestal of the obelisk of Alexandria, the specimen was forwarded to Mr. Alexander L. Holley, with a request that he would report upon the character of the metal and the probable method of its manufacture. Mr. H. who, by the way, is an engineer of very high rank, reports as follows:

The specimen was too small for any physical test whatever. A clean fracture revealed to the expert eye a tough-looking metal, not unlike what is called puddled steel.

I sent the specimen to Dr. Wendel, the able chemist of the Albany & Rensselaer Iron and Steel Works, who took such an interest in the matter that he made the following very complete analysis:

Iron	98.788
Carbon	0.521
Sulphur	0.009
Silicon	0.017
Phosphorus	0.048
Manganese	0.110
Nickel } Cobalt }	0.079
Copper	0.102
Calcium	0.218
Magnesium	0.028
Aluminium	0.070
Slag	0.150
Total	100.090

If we had not known from the general history of the iron manufacture that the specimen must have been made by the Catalan process, the analysis would have so indicated. The notable facts are: About half a per cent. of carbon, giving the hardness of ordinary rail steel; very low silicon and phosphorus, due to the method of manufacture, and a remarkably large amount of calcium, indicating the plentiful use of lime as a flux in the process. The small amount of slag (for a Catalan product), as well as the fine fracture, indicate frequent reworking.

The Catalan process is simply subjecting to a high red heat pulverized iron ore mixed with charcoal, enough to combine with its oxygen. The product is a pasty mass of iron which is substantially pure chemically, excepting the little carbon it has got out of the fuel, but which is mechanically mixed with silica, phosphate of lime, alumina and other impurities the ore had. By repeatedly beating the mass to a plastic condition and hammering it, this dirt is pretty well expelled, and the product, although costly, is excellent wrought iron. This process is still in use where ore and charcoal are very cheap, but the modern soft steels have almost displaced it as a material for boiler plate and other fine products. Yet, curiously enough, as Catalan iron is supplanted by steel, the Catalan process is coming into still greater use to furnish material for open-hearth steel. The pasty mass above described quickly melts in the cast-iron bath of the open-hearth furnace, and mechanical impurities float off as slag. Dr. Siemens' modern improvement of the Catalan process—performing it in a steam-rotated regenerative gas furnace, and on a very large scale—produces so cheaply that it is likely to furnish most of the material for fine open-hearth steel. Thus, the prehistoric method, facilitated by modern engineering, is coming again to the front.

Changes of Flour in Becoming Bread.

In popular use we employ the word "bread" to qualify loaves which are served in slices. The rolls are much smaller. Both consist alike of crumb and crust. The crumb is made up of a multitude of cells of thin walls containing carbonic acid gas, the product of fermentation in the dough. These walls of the cells contain both gluten and starch, and traces of dextrine and sugar. As a consequence of the treatment of water and the application of heat, the starch grains, which, in their normal condition, are little sacks filled with minute granules of starch proper, have been swollen and burst. Starch similarly treated by itself, as in the preparation for stiffening linen in the laundry, when dried in a thin layer upon glass plate, for example, is transparent, and presents a glazed surface. When this glazed material is removed with a knife blade, it is seen to be stiff and horny. The gluten, which is mixed with it in the crumb of bread, and which may be conceived to be continuous, however thin throughout the wall of the cell, has been, by the process of baking, dehydrated; that is, the heat to which it has been subjected has driven out a certain amount of water, which chemically sustains something like the same relation to the gluten from which it has been expelled that the water expelled by heat from alum-crystals sustains to the original body of alum. This is the condition of the gluten from the crumb in the interior of the loaf at the instant of its removal from the oven. On drying, it abstracts the water from the starch with which it is coated, or intimately mixed, as the roasted alum absorbs the water that is sprinkled upon it. The starch, by this process, being dried and stiffened, gives its support to the walls of the cell, and renders the texture of the staff loaf more firm than that of the fresh loaf.—*Prof. Horsford.*

Zincography for Amateurs.

In a recent paper read before the London Society of Arts, Mr. Thomas Bolas, F. C. S., described zincography as a simple and easy mode of printing in the following fashion: Zincography, he said, is similar to lithography, except that a zinc plate is employed in the place of the lithographic stone. The so-called transfer paper is merely a moderately fine paper which has been brushed over, on one side, with a mucilaginous mixture, prepared by boiling together the following: Water, 1,000 parts; starch, 100 parts; gamboge, 6 parts; glue 1 part. This paper is written upon with the ordinary commercial lithographic writing ink, which has been rubbed up with water like an artist's water color. The writing being dry, it is necessary to moisten somewhat the back of the transfer by means of a damp sponge; after which it is laid face downward on a sheet of ordinary roofing zinc, which has been previously cleaned by means of emery cloth. Both being now passed together under the roller of a small press, the transfer adheres to the metal plate; but on damping the back of the paper it becomes easily removable, leaving the writing on the zinc. The face of the zinc plate is now gently rubbed over with mucilage of gum arabic, which is all the better for being slightly sour, and the excess of gum having been sponged off, an India rubber inking roller charged with ordinary printer's ink, is passed over the still damp zinc plate a few times. The ink takes only on the lines of the transferred writing, and it is merely necessary to lay a sheet of white paper on the plate and to pass both through the press to obtain an impression—an exact reproduction of the original writing. Any number of copies can be printed by repeating the operations of damping and inking. The zincographic process, thus simplified, is rapid, economical and within the reach of every one.

KEEP THE FARM TOOLS SHARP.—The *Germantown Telegraph* gives the following seasonable and sensible hints on the sharpening of tools: "Too often these things are not thought of until the articles are wanted, when much valuable time is lost in putting in order what might as well have been done during the dull winter days. It has been computed that the same man can do as much in two days with a sharp scythe as in three days with one comparatively dull and the same expenditure in force. And it is just the same in regard to all other tools or implements, whether operated by hand, steam or horse power. The engineer continually oils the machinery, and a good saw or file is oil to hand implements. We know one who has a great deal of hand heeing to do by hired labor, and he believes that the continued use of the file on the hoes makes a difference of nearly one-half in the labor. His calculation is that every 10-cent file he buys saves him $10 in his laborers' hills. A good grindstone and a set of files are among the best of farm investments. The best of all forehandedness is that which prepares in advance a full set of good and well-repaired tools to work with.

PRESERVING FLOWERS.—The flowers must be carefully surrounded by perfectly dry, fine sand, in such a manner that they will hold their form, the pressure of the sand upon all surfaces being alike. Any fine clean sand will answer; it should be sifted to remove all coarse particles, and then washed in successive waters until dust and all earthy and clayey matters are washed away, and the last waters when poured off are perfectly clear. The sand is then to be dried and then to be placed over a fire in a proper vessel, until quite hot, hotter than the hand can bear, and when cool it will be fit to use. After heating, it should be used at once, before it can absorb moisture from the air. Good results have been obtained by taking a clean, thoroughly dry flower-pot, the hole in the bottom of which was stopped by a cork. This was filled a third full of the dry sand, the flowers set carefully in the sand, and then more sand slowly added, so as to surround and cover the flowers inside and out, and set in a warm place. At the end of 24 hours, the cork was removed from the hole in the flower-pot, and the sand allowed to run out in a small and gentle stream. The flowers were left in the pot, perfectly dry.

TRIANGLES.—We do not recollect of having ever seen any rule for obtaining the length of side of an equilateral triangle of known area. Although a simple problem, and perhaps of but occasional use, we have arranged a convenient rule for its solution. To obtain the length of side of an equilateral triangle, the area being given, multiply the area by .57735, and take twice the square root of the product for the length of side. A line bisecting an angle and equally dividing the area of an equilateral triangle, in other words, a perpendicular raised midway of the base, is .866025 of a side.—*Exchange.*

GOOD HEALTH.

Why Teeth Decay.

Upon a careful review of the opinion and experiments of our best investigators, says Doctor S. M. Prothro, in a paper read before the Tennessee Dental Association, it is conclusive that there are but two active agents in the process of dental caries, namely the action of acids and the development of a vegetable parasite, *Leptothrix buccalis*. By actual experiments it is demonstrated that it does not require strong acids to separate the phosphoric and carbonic acids from the lime contained in the tooth substances. Even water that contains carbonic acid will dissolve the calcareous salts. And it seems from a circumstance that transpired under the eye of Mr. Spence Bats, that water alone can dissolve the teeth.

A lady having two sets of artificial human teeth, placed one set in water to preserve it till she had worn out the other. At the expiration of seven years, the set that she had kept in the water was as much corroded as the one she had worn in her mouth. This case corroborates a statement made by Wedl and Heider, that at the end of ten days fungi had attacked the enamel and dentine of the teeth that had been kept in pure water, and that in a few weeks the tissues were pierced with holes like a sieve.

All mineral, as well as vegetable acids, act promptly upon the teeth. "In forty-eight hours acetic, citric and malic acids will corrode the enamel so that you may scrape a great portion of it away with the finger-nail." Acid tartrate of lime, having a greater affinity for the lime of the tooth than for its own base, will rapidly destroy the enamel.

Grapes in forty-eight hours, will render the enamel of a chalky consistence. Vegetable substances are inert till fermentation takes place and acetic acid is formed. Sugar has no deleterious effect, only in the state of acetous fermentation. Animal substances exert no injurious effect until putrefaction is far advanced.

Novel Mode of Preserving a Man's Reason.

A curious story is going the rounds of the English newspapers of an exhibition in the show windows of one of the leading jewelers of Vienna. The object of attraction is a brooch magnificently studded with gems, in the middle of whose chasing is inclosed the most singular of centers—four common, old, bent and corroded pins. This brooch is the property of the Countess Lavetskofy. The pins have a history, of course. Seven years ago Count Robert Lavetskofy, as the story runs, was arrested at Warsaw for an alleged insult to the Russian Government. The real author of the insult, which consisted of some careless words spoken at a social gathering, was his wife. He accepted the accusation, however, and was sent to prison.

In one of these lightless dungeons in which the Czar is said to be fond of confining his Polish subjects, the unfortunate martyr for his wife's loose tongue spent six years. He had only one amusement. After he had been searched and thrown into a cell, he had found in his coat four pins. These he pulled out and threw on the floor; then in the darkness he hunted for them. Having found them, perhaps after hours and even days, he scattered them again. And so the game went on for six weary years. "But for them," he writes in his memoirs, "I would have gone mad. They provided me with a purpose. So long as I had them to search for, I had something to do. When the decree for my liberation as an exile was brought to me, the jailer found me on my knees hunting for one which had escaped me for two days. They saved my wife's husband from lunacy. My wife, therefore, could not desire a prouder ornament."

THE TRANSMISSION OF SCARLET FEVER BY MILK.—A report has been issued by the Local Government Board on a sudden outbreak of scarlet fever at Fallowfield, near Manchester, England. The outbreak included 35 persons, belonging to 18 families, and of the individuals who suffered, not less than 24 were attacked within 36 hours, between Sunday morning and Monday evening. Dr. Airy was directed by the Local Government Board to investigate this outbreak, and the results of his investigation are, says the *Lancet*, given in the report now before us. The outbreak was quite local, and the different details elicited tended to the general result that the infection had been distributed to the families through the agency of a particular milk supply. The facts bearing on this point do not well admit of any other interpretation. The question of the mode in which the milk could have become infected was not so fully cleared up, but it is shown that one of the milkers on the dairy-farm lodged in a farm house where scarlet fever was present at the time when the milk presumably became infected, and it is suggested that the infection was communicated to the milk, in some way undetermined but not inconceivable, through his agency. The report throughout is of very considerable interest, and forms an important contribution to our knowledge of the *mechanism*, if we may so write, of certain of the observed phenomena marking the progress of infectious diseases.

The Week.

We are in the midst of another rain storm, which gives certainty to the fullness of the approaching harvest, and awakens hopes to the miners of a plentiful supply of water for the advancement of their operations. Our merchants and manufacturers are anticipating a prosperous season, and confidence is being rapidly restored. A more healthy tone already exists in business circles, and the near future is replete with promise of brighter and better times. It does appear as if the gloom and despondency which has for so long a period clouded all classes of the community is passing away. The San Francisco *Journal of Commerce* publishes interviews with over 100 merchants in every line of trade in the city, and all express a hopeful feeling that the hardest of the times are past, and that the prospects for business of the year are good.

A matter of considerable importance to California interests has transpired in Washington this week, in the appointment of a commission to China to amend the treaty or make a new one. This is referred to more at length in another column.

One of the great events of the week in industrial circles was the coming of De Lesseps in the interest of his Panama canal enterprise. He promises the speedy realization of his project. One thing seems assured, his brisk promotion of the idea will lead to carrying through a ditch some where down there, whether it be on his line or not, and that will bring us many weeks nearer to the great markets of the Atlantic coasts.

MINING DEBRIS IN CONGRESS.—The telegrams from Washington inform us that the House Committee on Mines and Mining have authorized Barry to report, with a recommendation for passage, a bill appropriating $250,000, to be forthwith expended, under direction of the Secretary of War, in the most efficacious manner, to preserve the navigable waters of California from injury from deposits of mining debris, and also to defray the expenses of further investigation of the whole subject by a commission, to consist of two Army engineers and one officer of the Coast Survey. This is in accordance with the recommendation of Col. Mendell, whose report we published in our last issue.

Hydraulic Mining in California.

The incoming season bids fair to be a very busy one with the placer miners of California, especially with those engaged in the hydraulic branch of the business. In the first place there is likely to be an abundance of water, while there is almost sure to ensue a considerable expansion of this class of operations. In the more central mining counties several of the older companies will, through the construction of deep drain tunnels, obtain an increase of their water supply or, of their other aids of production, materially enlarge the yield of their mines, while a number of new companies will here for the first time get to work. But it is in the more northwesterly counties of the State that this industry will the coming year show the greatest activity as well as the largest gains, for the reason that the field there is extensive and the business comparatively new, while the facilities for prosecuting it to advantage are of a superior kind. The deposits of hydraulic gravel in that section of the State are large, and apt to be of high grade. Water is in good supply, and can be a general thing be introduced upon the mines at small cost. There is little trouble there about outlet and none as regards the disposition of the tailings, from which there is no interest exposed to be harmed. Encouraged by these favorable conditions, a good deal of capital has been invested in the hydraulic mines of Trinity county within the past few years, and latterly some little also in Siskiyou and Del Norte counties.

Some of the enterprises inaugurated in Trinity county have been on an extended scale, the quantity of water and the extent of ground secured by most of the companies who have lately started in there having been large beyond precedent. The landed possessions of the Buckeye company, located on the high ridge bearing that name, embraces something like a thousand acres of ground; the amount of water claimed by them being also very large. The gold-bearing gravel lands of the Trinity, formerly the Weaverville Ditch and Hydraulic mining company, comprise 2,872 acres, their water rights covering somewhere about 20,000 miners' inches of water. A portion of this water has already been introduced upon their claims, which are well outfitted and being operated in an efficient way. Notwithstanding the extent of their ground, much the larger portion of it is rich in gold. The Taylor Flat property, now nearly ready for active operations, crosses some exceedingly rich gravel deposits, with a first right to the entire flow of French creek, which carries never less than three thousand, and for two-thirds of the year as much as six or seven thousand inches of water; while of the Dutton creek property very nearly the same may be said, the quantity of water being here somewhat less. The ditch projected for bringing the waters of the North Fork of the Trinity upon the mines lying along the main river, will carry not less than 5,000 inches of water. Messrs. Watson, La Grange and Gibson, who are already largely interested in a number of valuable properties on Trinity river, are moving in the matter of conveying the entire flow of New River—a large tributary of the Lower Trinity—upon Hawkin's Bar, a rich and extensive deposit of gravel, situate near the junction of these two streams. As coadjutor in this enterprise, these gentlemen have Walter Scranton, of the great iron manufacturing family of Scranton, Pa. The same parties having purchased the Willehire gravel mine on Trinity river, with accompanying water-rights, will, through the enlargement of the present ditches and washing apparatus, increase the productive capacity of the property many fold.

In point of magnitude, however, the properties and franchises of the Trinity River Canal and Hydraulic mining company overshadow those belonging to any other company in Trinity county, or perhaps in the State, the landed possessions going with this one ownership comprising 36 separate mining locations, the whole aggregating 3,707 acres, while the water franchises appurtenant thereto cover a first right to the entire flow of Coffee creek, the main Trinity and its East Fork, Eagle creek and several other streams in the vicinity, the aggregate flow of which is never less than 20,000 and for seven or eight months in the year amounts to as much as 60,000 inches of water. The whole of this water it is intended shall ultimately be diverted from its present channels and be employed for mining purposes, a considerable portion of the canals necessary to that end having been already constructed. The expenditures made on this property to date amount probably to $200,000, all the tools and supplies requisite for the employment of a large working force having been furnished, some of the claims having been opened and partially equipped, with some apparatus in place and more on the ground, besides much canal construction accomplished. As the auriferous lands embraced within the limits of this estate have, under very extensive workings shown themselves to be among the most prolific in Trinity county, there is little doubt but this enterprise if properly carried out will eventuate in a great success. There is hardly another mining estate in California that possesses such capabilities as this. To fully utilize its resources will, however, require some time and no inconsiderable means.

As regards extent of mineral lands there is but one company on the coast, the Mammoth Blue Gravel, on Chalk Bluff, Nevada county, that owns a larger area than this Trinity River company, the claims of the former, a large proportion of it patented, covering nearly 12,000 acres. In the matter of water supply, however, this company is much behind that in Trinity county. As their deposits consist mainly of drift diggings, this deficiency is not at all vital nor yet very important, there being here enough water for washing the gravel extracted by drifting, with some also for hydraulic operations. This is a valuable estate and requires only a small amount of working capital to insure for it an immediate, large and profitable production, as it is traversed from end to end by the old river channel that in times past enriched Red Dog and You Bet at its lower end, and several famous camps situated along it higher up. The property is to be thoroughly outfitted and vigorously worked the coming summer. Various other examples might be cited in evidence of the healthful condition of hydraulic mining in California and illustrative of its steady progress as well as its tendency to expansion.

Proposed Changes in the Mining Laws.

In view of the great interest taken by the mining community in the matter of the proposed changes by Congress in the mining laws, we have endeavored to obtain as full opinions as possible from various sources for the purpose of ventilating the subject. In pursuance of this object we propounded a series of questions to Mr. W. A. Skidmore, which we append with the answers furnished by that gentleman. Mr. Skidmore is Secretary of the California Miners' Association, and was for several years deputy in this State for the U. S. Mining Commissioner, R. W. Raymond. His acquaintance with the miners of this coast is thorough, and he is the author of a work on mining law. Nearly all the material relating to California mines in Raymond's report was written by Mr. Skidmore, who has visited nearly every camp on the coast. His familiarity with the subject renders his opinion on these proposed changes worthy of attention and respect. The questions propounded to Mr. Skidmore were as follows:

Among the first eight sections of the mining bill now before Congress, it is provided:

1. That a mining claim shall be 1,500 feet in length on the line of the ledge by 600 feet in width.

2. That the locator shall not follow the dip of his ledge beyond the point where it is intersected by the surface boundary, drawn down vertically.

3. The locator shall be allowed one year after making the location to discover minerals.

4. Requires the locator, within 90 days after making his location, to have his claim surveyed by a deputy U. S. Surveyor, and a plat of the same filed with the Surveyor-General of the State or Territory.

In consideration of the foregoing, and as a matter of information for the benefit of the class of men who do the prospecting and locating of mines, we solicit your opinion on the following questions:

1. In the boundaries of a mining claim, as fixed by this bill, what would be the average depth at which ore bodies, in their varied angles of inclination downward, would pass outside of the 300-foot boundary line?

2. How many parallel side locations would there, on an average, be required to secure the ownership of the ledge to a depth of 2,000 feet?

3. In a majority of instances, would the average depth at which the ledge would pass outside of the 300-foot boundary, be more than sufficient to determine the character and value of the mine?

4. In the event of the locator being unable to secure the continuation of his lode, in its dip down and beyond the point where it passes outside of the 300-foot boundary, would you consider the mine of any practical or permanent value, and would capital invest in expensive hoisting and reduction works on such a mine?

5. Would the average depth at which the ledge in its dip would pass outside of the 300-foot boundary line be at a point on the ledge above or below water level? and, as a general rule, does the water-level line mark a change in the permanent character and value of the mine?

6. Would not the provision allowing one year after making the location to discover mineral (vein matter) be detrimental to mining interests? and would this provision subserve any other purpose than that of blackmailing and effectually robbing the original locator of his mine?

7. Under the provision requiring a survey of a claim would it—in the case of discoveries made hundreds of miles remote from communication by water or rail—be practical, even if possible, for the locator to take a deputy U. S. Surveyor on the ground and do the work required within the allotted time of 90 days? And furthermore, what would be the per diem cost for the surveyor and assistants for the round trip, and also in view of the fact that prospectors as a class are poor men, would not this requirement be an effectual bar to all prospecting for mines in unexplored regions far distant from the confines of civilization?

8. Would you recommend vertical boundary lines in locating any class or condition of mineral deposits? If so, state the nature of such ore bodies and the nature of the formation in which they exist, whether primary or secondary.

9. Is any change in the mining law as it now stands, needed or required at this time, and would not the proposed change now sought to be made, work disaster and consequent ruin to the mining industries of the Pacific coast?

In response to the above, Mr. Skidmore sends us the following:

EDITORS PRESS:—I shall endeavor to reply briefly and concisely to your questions respecting the effect of the new mining bill now under consideration before a Congressional committee, and shall take up the questions in the sequence in which they are framed by you.

1. The depth at which ore bodies would pass outside of the 300 feet vertical line would depend on the dip of the ledge from a horizontal plane. In Amador county on the mother lode, where quartz mining has been continuously prosecuted for more than 20 years, with expensive plants, the depth attained would vary from 1,000 to 2,000 feet on the dip or incline of the ledge. By reference to statistical tables, I find that the dip of the mother lode in this county varies from 55° to 70°. Under such conditions the ledge would pass outside of the vertical lines at a depth of from 600 to 800 feet, while if we should refer to similar statistics of the leading mines of Nevada county we should find the average dip to approximate 50°. The depth attained in the leading producing mines varies from 800 to 1,600 feet, and in many of the most valuable properties in California the ledge would have passed without the exterior vertical lines at a depth of about 500 feet. It is the custom of miners to locate their ground so that the surface area shall correspond in width on either side of the supposed lode line, in order to protect themselves from the contingency of a change of dip below the surface plane, and to provide ample room for the plant, the wood pile and the ore and waste dumps, water ditches, etc. Nine claims out of ten located under the present United States mineral law cover 300 feet on each side of the lode, and in the event of the passage of the contemplated bill, mine owners under the new system would have to cease operations at some depth varying from 400 to 800 feet from the surface, or acquire by purchase all parallel locations on their front. Under these conditions, none of the leading producing quartz mines west of the Sierra Nevada would now be in operation.

2. Under the operation of the proposed law the mine owner, or company, would not be justified in erecting hoisting and pumping works and mill machinery, unless he possessed or controlled by location or purchase at least three parallel claims each of 600 feet in width by 1,500 in length. If we assume that his lode location carried 300 feet on each side of his cropping, he would require at least two more locations on his front or hanging wall side (1,200 + 300 feet = 1,500 feet) before he would be justified in the erection of pumping and hoisting machinery with capacity to explore his vein to a depth of 2,000 feet. The actual cost of such a plant, for mines in continuous operation, is frequently over $100,000, exclusive of cost of mill.

3. In many instances the depths at which the ledge would pass outside the 300 feet vertical boundary line would not be sufficient to predicate an opinion upon the value of the mine; and in a majority of cases the character and value of the ground could only be determined at this point of exploration, which is usually 100 feet below water level. The famous Eureka, Idaho and Empire ledges of Grass Valley, Nevada county, are examples in point, as also the Keystone, of Amador county; per contra, the Soulsby mine, of Tuolumne county, would not be affected, as it stands nearly perpendicular; but this is the exception.

4. No mining expert could indorse nor would any prudent business man invest in any quartz mine on the western slope of the Sierra Nevadas, if located under the proposed law, unless a frontage ground of at least 1,500 feet was secured in addition to the original location. It must be borne in mind that our profitable gold-bearing quartz ledges are of low grade—say from $10 to $20 per ton—and this grade is not sufficient inducement whereon to erect new plants and sink indefinitely through the country rock to intersect your neighbor's ledge. Such locations could only be held for purposes of extortion.

5. In the California quartz system the average depth at which the ledge, in its dip, would pass outside of the vertical line, under the 300-foot system, would be below the water level, and as a general rule the water line marks a change in the character of the ores.

6. The provision to allow one year for the discovery of ore would be detrimental to the interests of the locator and of the neighboring vein owner. It would permit valuable ground to be "tied up" in the interest of those who wished to extort and blackmail from the first locator, especially in new districts; and could be productive of no good to the capitalist, since the risk would be out of all proportion to the cost. But even if meritorious, one year's exploration would rarely be sufficient to uncover the supposed continuation on the line of dip, and the expense of sinking would be much greater through the country rock than that of the original locator, who followed his vein. Necessarily, such work would be useless, for either the mine owner must sell his plant, when he had reached his limit, or must purchase the undeveloped ground on his front, but the subsequent "locator" could prevent him from

prosecuting his mining work 300 or 400 feet below the soil.

7. The fourth provision of the proposed law would entail great and unnecessary expense upon the prospector. The fees of a U. S. Deputy Mineral Surveyor are usually $25 per day for field work (and expenses), or $10 per day for office work. The Deputy Mineral Surveyor usually has his residence either at the leading mining town of the district, or at the county seat, often from fifty to one hundred miles from the site of the prospector's discovery. The expense of a survey provided for by this act would vary from one hundred to two hundred and fifty dollars. The present act requires that the limits of the location shall be designated by metes and bounds and monuments. This should suffice as ample notice until such time as a U. S. patent is necessary, when the services of the Deputy Mineral Surveyor are called into requisition. As a matter of fact, nine out of ten locations are abandoned within the season located, and no necessity for survey exists until U. S. patents are applied for.

8. I can conceive of a condition of things wherein locations by vertical lines would be advantageous, but we have no instance of this character on this side of the Rocky mountains. The cavernous chambers of the Eureka Con. and Richmond have been judicially determined to be fissure veins, but it is probable that "bed-like deposits" of carbonate ores exist near Leadvilla, and elsewhere in Colorado, which would not be disastrously affected by the system of locations provided for in the new bill. Such deposits usually occur in the secondary formation.

9. No material change is needed in the mining laws of the United States. The theory that a vein or lode may be indefinitely explored on the line of the dip is coeval with the pursuit of mining, and under this theory all our rights of property have vested. Such an innovation as is now proposed would not only be detrimental, but fatal to the development of the mining interest of the Pacific coast.

Yours truly, W. A. SKIDMORE.

Jones' Self-Regulating Steam Trap.

In all places where steam is used, it is very desirable to catch and return the condensed steam where it can again be utilized, and the best water to put into the boiler is that which has been condensed from steam. It is in the most favorable condition for revaporizing. Where the pumps are at a distance from the boilers, there is always a liability of flooding them with water, and the steam is there less effective because of its lack of dryness. The Jones' Trap, manufactured by W. T. Garratt & Co., overcomes all such difficulties, and allows the condensed water to escape, while the steam cannot by any possibility blow out. These traps are used at the Mint, San Francisco, State University, State Capitol buildings, Mills Seminary and the California sugar refinery.

The pipe by which the steam enters is screwed in at *H*, the outlet pipe is at *G*, for steam connection, to be used only where steam is to be carried further on; the waste or outlet pipe for condensed water to pass out is at the end which is most convenient. If the steam is not to go beyond the trap, at *G*, it is plugged up. It is a steam drum as well as a trap. Dry steam can always be had; it is a valuable machine for steam engines to take the water out of the pipe before passing into the cylinder, or for taking it out of exhaust pipe after passing the engine, where the steam is wanted for heating, as it takes no power from the engine to force condensed water through the pipes. The condensed water passes through the pipes at *H* into conduct or strainer, which catches all refuse and thence into the basin in which is the float ball *A*. When the water in the trap reaches the hollow rod, *D*, it raises the float, which lifts the stem, *C*, from its seat, allowing the water to pass out. The hollow rod, *D*, opens at one end into the float, and at the other through the side into the open air; by this simple plan overcoming the objection to hollow balls, any leakage or sweating in them being evaporated into steam, and passing out, always keeping the float dry and the water at a uniform hight in the trap. It requires no attention, as it regulates itself by the flow of the water into it, and the steam cannot blow out to waste. The force of the steam makes no difference, if it is 5 lbs. or 100 lbs., it is all the same.

STATE DOCUMENTS.—We have received the following pamphlets, containing the reports of the departments or officers to which they refer, for the years 1878-79: "Transactions of the State Agricultural Society;" Report of Board of Commissioners of Sacramento Drainage District; Report of State Harbor Commissioners; Biennial Report of Secretary of State; Report of State Normal School Trustees; Report of Directors of Deaf, Dumb and Blind Asylum; Biennial Report of State Board of Equalization; Report of Fish Commissioners; Report of State Board of Examiners; Report of State Board of Health; Report of California State Prison Commission; Report of Insurance Commissioner; Report of Directors of Insane Asylum; Report of State Superintendent of Public Instruction; Report of Attorney-General; Report of Adjutant-General; Report of State Controller; Report of Commissioner of Transportation.

Legislative Matters.

Young has offered a substitute to the Sweetland substitute drainage bill. The general features of the original are preserved, except that all that part relating to district bonds was stricken out and provision made for a district tax of one-twentieth of one per cent., and an annual State tax of one-twentieth of one per cent., and a tax of one-third of one per cent. on each miners' inch of water used in the hydraulic mines. Provision was made for assessing lands benefited by the work proposed. In other respects the bill was the same as the original Crown-Parks bill.

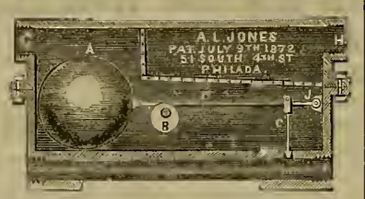
When the substitute had been read, on motion of Tyler it was ordered printed and sent to its place on the second reading file.

Pending discussion on other unimportant amendments, Sweetland introduced a resolution asking that several members, among them being one-half of the San Francisco delegation, be permitted to go to Marysville and look at the debris around there. Burns amended to have the whole Assembly take a trip to Marysville. Much confusion ensued, members asking for information and protesting against the resolution. On motion of Anthony, it was finally laid on the table.

Fraser has presented three petitions in favor of paying J. W. Marshall, discoverer of gold, $50 per month, as proposed in a bill before the House.

It is becoming questionable whether there can be any legislation on the debris question during the present session, notwithstanding its importance. There have been four bills in the Assembly on the subject. The first, that by Brown of Yuba, of which complaint was made that it was drawn too much in the mining interests, and too great powers were conferred. The second, by Carr of Yuba, drafted, as claimed by the miners, in the interest solely of the agriculturists. Then the bill filed by Chamberlain of Placer, providing for a State appropriation of $600,000 for the erection of dams in the canyons in the mountains to corral the debris. Fourth, a bill by Brooke of Butte, appropriating $30,000 for further investigation by the State Engineers' department. The Chamberlain bill has been killed. The Carr bill has been once defeated. The Brown bill has been so amended that it is claimed that it will not amount to anything. The Brooke hill is the *dernier resort*, if nothing better can be done.

Stroog efforts are making to effect a compromise upon the debris issue. Young submitted a substitute to raise funds by taxes in three districts, the first by a district tax one-twentieth of one per cent. Second, one-twentieth of one per cent. tax over the whole, and one-third of a cent tax on each miners' water running twenty-four hours. The amount which will be raised by this tax has been variously estimated from $400,000 to $600,000. It will be noticed that this substitute meets the objections which have been raised by the agricultural interests against the issue of bonds. Some of the farmers of Yuba are already objecting to the district tax, contending that they really have no more interest in the matter than the remainder of the State.



Jones' Steam Trap.

The following bill amending section 382 of the Code of Civil Procedure was introduced in the Senate by Davis of Yuba, to remedy the difficulty which arose in the recent debris suit. Of the parties to the action, those who are united in interest must be joined as plaintiffs or defendants, but if the consent of any one who should have been joined as plaintiff cannot be obtained, he may be made a defendant, the reason thereof being stated in the complaint; and when the question is one of a common or general interest of many persons, or where the parties are numerous, and it is impracticable to bring them all before the Court, one or more may sue or defend for the benefit of all. In actions to abate a nuisance or for an injunction to prevent the commission or continuance of acts creating a nuisance, all persons contributing to the creation or continuance of the nuisance complained of may be joined as defendants.

NEW MEXICO'S copper interests must in time become of even greater importance to the country than those of Lake Superior, for even now the Clifton district mines, near and extending over the Arizona line, pay $60 per ton for charcoal and $70 per ton for ox team transportation to the end of the track, and compete with the Lake Superior districts in the great markets of the East.

THE order to increase the police force of San Francisco was passed Monday night by the Board of Supervisors over the Mayor's veto.

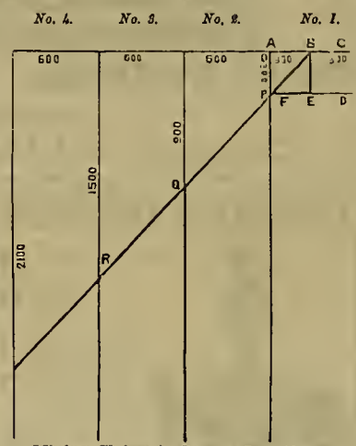
Congress and the Mining Laws.

The proposed legislation by Congress, with relation to the mining interests, is looked upon unfavorably by all the mining men with whom we have conversed on the subject. We are in receipt of a great number of letters from miners in different sections, asking us to oppose the changes and giving their opinions on the subject. Their views all agree with those expressed in an article in our last issue, and in these letters published in other columns of this number of the PRESS. The changes are universally condemned by the working miners, the prospectors and all those who expect to make a living out of mines by hard work.

We give on another page the full text of the proposed law, and also the views of a gentleman thoroughly conversant with the mining interests of this coast. We notice that on Wednesday, Representative Page made an argument before the House Mining Committee in opposition to any change in the present law authorizing ledge locations, so far as California is concerned. Berry has also, we understand, spoken against the changes.

The truth of the matter is, that if some of these propositions are adopted, poor men might as well give up trying to prospect for or locate mines. Not one of 20 new claims ever amounts to anything. The miners always call them "prospects" or "claims," not mines. They don't become mines until developed to produce ore regularly.

The provision requiring a man to have his claim surveyed within three months of date of location, coupled with that allowing a year to discover mineral, may do well enough for men of means, but not for the ordinary prospector. You cannot once in a hundred times prove the value of a claim in three months. Suppose a prospector, hard up as usual, starts in on a likely place and works a month or two; at the end of the time his "grub stake" is nearly



Mining Claims in Square Locations.

gone, but he perseveres in hopes of finding a "mine." Just then, however, he finds his three months nearly up, and must spend from $100 to $500 to bring a surveyor to the ground. He must, therefore, drop work and leave. Anybody with any money, having a year in which to find mineral, would pay for the surveyor, if he knew a claim near by was developing a good property, and he could sink down and take the ledge outside of their lines.

With reference to the square location, we append one of the many letters we have received on the subject, which will give a good idea of the injurious features of the proposed changes:

EDITORS PRESS:—If I am right in my interpretation of the proposed amendments, given in your last issue, there will be little prospecting and less mining done on this coast, should it become law.

The dimensions of a claim are fixed (as at present), 1,500 feet along the lode and 600 feet wide. Now, suppose a lode to pitch at an angle of 45°, and the croppings run along the center of the 600 feet lengthways of the 1,500, and a shaft is sunk on the croppings 300 feet from one of the side boundaries of the claim; the locator not being quite sure how his lode was going to dip, would, in all probability so locate his claim that the croppings would be in the center of the 600 feet, and sink on them. Suppose he does: At 300 feet depth he would be out of his ground, because the dip of the lode would carry him beyond the vertical of his side line, as shown in the accompanying diagram.

Thus, let *A*, *B*, *C*, *D*, *E*, *F*, represent a cross section of location No. 1, along its width to the depth of 300 feet; *B*, the line of the center of the lode; *B F*, the dip of the lode (say 45°); *B*, the point from which a shaft is to be sunk.

No sooner does the miner get down as far as *F* (300 feet), either by a vertical shaft, *B E*, or an incline on the lode, *B F*, with a crosscut, *E F*, and perhaps finds pay near *F*, none before possibly, then, being beyond the vertical line of his surface location at *A*, he is prevented from following the lode he has discovered by an anomalous piece of ill-advised legislation.

Meantime another has taken up the adjoining parallel claim, No. 2, sinks 300 feet from *O* to *P*, and reaps the benefit of No. 1's labor.

But he can only get down 900 feet when he is shut off by his end lines, at *Q*, having had only 600 feet on lode.

No. 3 sinks 900 feet in country rock, gets the lode at that point, and is shut off by his end lines at *R*, 1,500 feet deep, having only 600 feet of lode.

This system would involve a great many needless shafts to get down to the lode in unproductive ground, each one getting deeper as it gets farther away from No. 1, whereas by the law as it at present stands, one shaft would work the whole, because the owner of No. 1 is allowed to follow his lode on its dip *usque ad infinitum*. It would not mend matters much were it allowed by this proposed amendment of the law, to take the 1,500 feet across in place of lengthways of the lode. No. 3, for instance, being already down 900 feet would work his lode to the 1,500 at *R;* but to get to that depth, No. 4, would have to commence on top and sink another shaft 1,500 feet deep to get as low as No. 3.

Yours truly, LEWIS CHALMERS.

The Vulture Mine.

This well-known mine is located 15 miles from Wickenburg, in Arizona. It was discovered in 1862, and came into the possession of the Central Arizona mining company, of New York, about seven months ago. The property is three and a half days distant from San Francisco by railway and stage, of which latter method of conveyance there is a daily line each way. The telegraph is 15 miles distant. The company was incorporated in New York, with a capital of $10,000,000, and the stock is listed there.

The reputation of the mine has long been favorably established. From the date of its discovery until it passed into the hands of its present owners, the records of its operations show that 200,000 tons of ore were extracted, and the yield of bullion therefrom amounted to about $3,000,000. The present company intend to fully equip and develop the mine and to improve the entire property. For this purpose they will, if necessary, expend $200,000, or more. Water being scarce, their first movement has been to procure a sufficient supply, not only for milling purposes but also to supply the town which is expected to grow up on the town site included in the property. To accomplish this they have purchased 15 miles of pipe of sufficient capacity to deliver 18,000 gallons per hour. The ground has been surveyed, and the pipe will be laid as soon as it reaches the mine.

The present mill capacity being only sufficient to crush 50 tons per day, a new mill has been purchased with the capacity of reducing 240 tons every 24 hours. When fully completed it will not be surpassed by any mill in the Territory. The rock is readily crushed, and it is calculated that each stamp will pulverize three tons per day. The mill will run 80 stamps. There is sufficient fuel to last from 15 to 20 years. The mill machinery is being made in this city by the Golden Gate and Miners' Iron Works, and the mining outfit by the Risdon Iron Works.

The surrounding country is rolling, with a general slope toward the Gila river. The vein walls are mica slate. There is no water of any account to contend with in the mine thus far. The length of the lode is 2,000 feet. It has been explored over that extent to a depth of 600 feet, showing a body of ore estimated at 600,000 tons, which can be taken out without the necessity of deeper work. This estimate, as to quantity, will be considered moderate when the size of the lode is taken into account. The vein is 60 feet wide; it dips at an angle of 37 degrees. The ore is expected to pay for working from wall to wall. Selected ore will yield from $50 to $60 per ton in gold. The average through the whole vein is from $7 to $30. The lode carries free gold, and consequently it is an easy ore to work. Some of the threads or narrow seams in the vein are very rich.

Two double compartment shafts are being sunk, and will be carried down to the 600 level. Hoisting works will be used at both of them. The ground in the mine stands well, and so far, has required no timbering; it is firm and tenacious. There have been several chambers opened in the hulk of the vein upon rich bodies of ore; some of them are from 150 to 200 feet in length and from 20 to 30 feet high; and they stand well without having been timbered.

The Southern Pacific railroad now runs within 45 miles of the mine.

ANOTHER "PROCESS."—The telegraph informs us that Colonel A. C. Tichenor, inventor of "the electric process" of reducing gold and silver ores, which will revolutionize old methods, has passed through Omaha on his way to this city. It tells us, moreover, that "he has already realized over $200,000 from his invention, which has not been hardly introduced to the mining public." This revolutionizing of old processes, which has been going on for some twenty years or so, is like the revolutions in Mexico—no results. There have been several dozen electric processes tried in this State so far, none of them successfully. What the new one is, we do not know, but are somewhat curious to learn.

Something New in Sewage Disposal.

One of the most pressing of problems in great cities nowadays is how to get rid of their vast accumulations of sewage. Discharging it into rivers and harbors is only to exchange one kind of nuisance for another of rapidly increasing sort. To carry it hy any system of pipes or sewers far enough away to obviate this difficulty is a task of enormous labor and expense. Even in the case of seaports it is often an immense undertaking to throw it into the sea at a point where the tides will disperse it instead of bringing it back, like the proverbial home-returning curses. The city of Boston is now entering upon an expenditure of several millions of dollars for this purpose, and it is still a mooted question whether the system will he perfectly successful.

A new plan is about to be tried in England, which may prove, at least in some cases, both effectual and economical. For several years certain parties there have advocated the use of specially adapted vessels for depositing the sewage and refuse of large towns in deep sea-water, and it is believed the municipal authorities of Liverpool will possess the first of a fleet of vessels that will materially assist in the disposal of sewage. At present the refuse of Liverpool is removed from the city in carts, but hy the use of steamers specially designed for the purpose a considerahle amount of money will be saved. The new vessel resemhles externally an ordinary steamer. The hull and the deck are huilt of iron, hut in the construction of the hopper cavities steel is used. The vessel has heen designed to carry a dead weight of 350 tons, and her speed will he nine knots an hour. Instead of one large hold, she has ten compartments or cavities, and these are perpendicular in shape, so as to admit of the contents falling readily into the water. Along the center of the line of cavities is a set of gearing hy which the doors at the hottom are opened and shut, and by means of strong iron rods the doors are kept open until all the refuse has been emptied, while hy reversing the action of the gearing the compartments are closed again. The arrangements seem well calculated to attain the ohject in view, and the experiment will be watched with interest hy the municipal authorities of other large cities.

JOHN TAYLOR & CO.,

Importers of and Dealers in

ASSAYERS' MATERIALS,

CHEMICAL APPARATUS AND CHEMICALS, DRUGGISTS' GLASSWARE AND SUNDRIES, Etc.

118 and 120 Market Street, and 15 and 17 California St., San Francisco.

We would call the special attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our stock of Clay Crucibles, Muffles, Dry Cups, etc., manufactured by the Patent Plumbago Crucible Co., of London, England, for which we have been made *Sole Agents for the Pacific Coast.* Circulars with prices will be sent upon application.
Also, to our large and well adapted stock of

Assayers' Materials & Chemical Apparatus,

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast.
☞ Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application.

JOHN TAYLOR & CO.

W. BRUCKNER'S
ROASTING FURNACE
AND
Ore Pulverizers.

(Awarded the Premium Gold Medal at Naples, Italy.)

The furnace is especially adapted for roasting rebellious ores; there are more than fifty in use in Colorado, giving perfect satisfaction.
The Ore Pulverizer is built in different sizes. It is preferable to Stamp Mills because it requires less power and less repairs than Stamps. No extra expense for setting up, and no foundation. Less weight and less cost than stamps.
Furnished also in sections for packing.
For circulars and prices apply to

W. BRUCKNER,
Mining Engineer,
323 Montgomery St., room 16

Ingersoll Rock Drills.

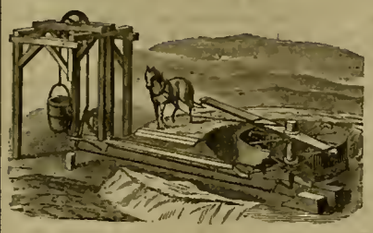
In use in the largest and best Mines of the Coast.

HAS AUTOMATIC FEED.

Has less Repairs.

Is Lighter and more Easily Adjusted than any other Drill.

Our DRY AIR COMPRESSORS are the most Economical Compressors in the Market.



MINERS' HORSE-POWER.

This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.
The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing

REYNOLDS & RIX, 49 Fremont Street, San Francisco.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from Hercules, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.

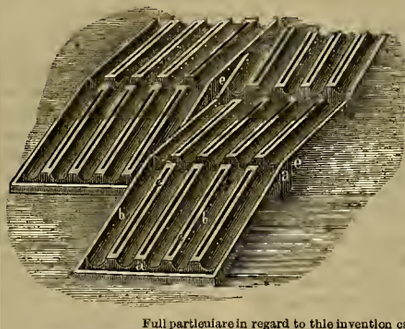
PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street, - - San Francisco, Cal.

Howland's Under-current, Mill and Sluice Riffle.



This invention meets a want which has long been felt by Gravel Miners and Millmen, viz.: that of a simple, cheap Riffle which will save the largest possible amount of gold or sulphurets, with the least possible waste of quicksilver. That this Riffle answers all these conditions will be apparent to any practical man who takes the trouble to examine it. The arrangement of this Riffle is such that there is a strong, unobstructed upper-current to carry off and break up the gravel or cement, and a slow under-current, checked by numerous riffles, which give gold or sulphurets a better opportunity of settling than if they were exposed to the force of the main current.

In this Riffle there are cast troughs for the quicksilver, which extend entirely across the sluice, and while they are so placed that the current will naturally pitch towards them, and give every opportunity for amalgamation, the quicksilver is fully protected from flouring or leakage. There is no mechanical skill required in taking out or replacing the sections.

Full particulars in regard to this invention can be obtained by applying to

STEIGER & KERR, of the Occidental Foundry, 137 First St., S. F.,

Who have the sole right of manufacturing this Riffle, and who will receive and attend to all orders.

In consequence of spurious imitations of

LEA AND PERRINS' SAUCE,

which are calculated to deceive the Public, Lea and Perrins have adopted A NEW LABEL, bearing their Signature thus,

Lea & Perrins

which is placed on every bottle of WORCESTERSHIRE SAUCE, and without which none is genuine.

Ask for LEA & PERRINS' Sauce, and see Name on Wrapper, Label, Bottle and Stopper. Wholesale and for Export by the Proprietors, Worcester; Crosse and Blackwell, London, &c., &c.; and by Grocers and Oilmen throughout the World.

To be obtained of CROSS & CO., San Francisco.

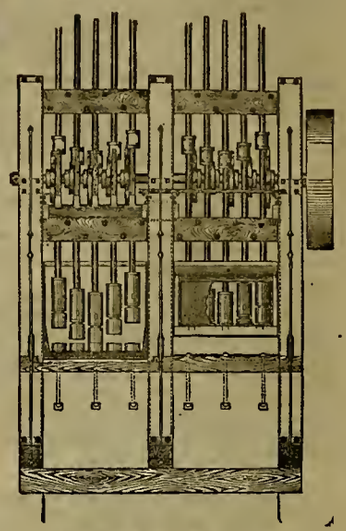
Machinery.

GOLD AND SILVER
Grinding and Amalgamating MACHINERY.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies.



SPERRY'S
Wrought-Iron Frame
FOR STAMP MILLS.

Great saving in time and money over the wood frame. Is made complete with wrought-iron frame ready to put upon the foundation, requiring no skilled millwright. These mills are unsurpassed in excellence in every particular.
We are furnishing all the Machinery for a 10-Stamp Gold Mill, including Crucible, Steel Shoes and Dies, Boiler and Engine, Counter Shafting, Pulleys, etc., Stamps weighing 450 lbs. each, with Copper Plate inside of the Mortars, and for tables outside, making all the Machinery complete for a 10-Stamp Mill for the sum of

$2,550.

We construct Mills with Stamps weighing from 350 to 900 lbs. for gold or Silver Ores. Wet or dry Crushing Mortars. Will contract to erect complete Gold and Silver Mills on the most improved plans. We have 30 years' experience in mining and milling Gold and Silver Ores, and can compete with the world. Send for a circular. Address

A Card from Architects.

The California Architect and Building Review.

Office, No. 240 Montgomery Street, San Francisco, Cal.

It is with pleasure that we publish the following from prominent Architects in this city:
Believing that a journal of its kind is a necessity on this coast, and judging from what has appeared in the "Quarterly Architectural Review," we are led to believe that the CALIFORNIA ARCHITECT AND BUILDING REVIEW will be worthy of generous support and encouragement. We therefore pledge our cordial sympathies, personally, and hope that the enterprise will receive kindly recognition and liberal support from all Architects and Builders and the public generally. (Signed) David Farquharson, Wright & Sanders, S. H. Williams, Thos. J. Welsh, P. Hueme, John Marquis, B. McDougal & Son, Wm. Mooser, Wm. Curlett, Meeker & Banks, W. C. Hoagland, S. & J. Newsom, B. Henrickson.

How to Stop this Paper.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by *letter.*

CONTINUED FROM PAGE 197.

claims have been discovered in the Sierritas. The rock assays from 15% to 40% of copper and $30 per ton in silver. Large quantities of virgin copper may be seen in the ledge.

COLORADO.

TOPEKA.—*Register-Call*, Mar. 5: The mill ore crushed gave a yield of over eight ounces gold per cord.

JENNIE BLANCHE.—This mine has been developed by a line of shafts its entire length, which vary in depth from 20 to 110 ft. Present exploitations are made through shaft No. 1, down 110 ft. Two men in sinking the last 25 ft have taken out 12 tons of smelting material, besides quite an amount of mill dirt. The ore assays from $60 to $240 per ton. The crevice pitches to the north at an angle of 35°, the principal part of the pay matter being found on the hanging wall.

CALIFORNIA.—The daily output of ore is fully 50 tons. This production of the mine could very easily be doubled should the management desire it. Forty-five stamps find constant employment on the ore now being raised, to say nothing of the smelting ore being assorted.

TRIO.—Gold retorts amounted to 46 ounces. The average of the mill ore treated was a trifle over four and a half ounces gold per cord.

HAZELTINE.—The Hazeltine mining company has uncovered a large body of pay in both the east and the west 100 levels. The latter level has a large amount in the back of the level, the first quality of which brings over $700 per ton.

ANGLO-CELT.—In this mine they have struck gray copper in the bottom of the shaft which is being sunk upon the vein. Ore assaying as high as 2,200 ounces of silver per ton has been found.

MONARCH.—Silver Cliff *Prospector*, Mar. 7: This mine has a vein between three and four ft wide, composed of carbonates with some galena, assays from which run from 100 to 2,000 ounces silver. One hundred tons of this ore averaged over 100 ounces silver per ton.

MOUNTAIN CHIEF.—The shaft in this mine is 150 ft in depth, two levels running north on the vein, respectively 50 and 35 ft in length. The vein matter is composed of carbonates and galena enriched with chloride and sulphurets. The pay streak is from one to three ft in thickness and assays from 100 to 3,950 ounces silver. They shipped 15 tons of ore, the lowest mill run from which was 67, and the highest 575 ounces silver and 50% lead.

HUNKIDORI.—This claim has, by way of development, an adit 20 ft long at the end of which is a shaft 20 ft in depth, containing a vein six ft in width, with a streak of galena and carbonates three ft in width, running from 30 to 105 ounces silver.

IDAHO.

RAMSHORN.—*Enterprise*, Mar. 18: This was the first mine discovered in the vicinity of Challis; it was struck in 1877. In 1878 there were shipped 30 tons to Salt Lake, which averaged $800 per ton. In 1879 75 tons of ore were shipped, averaging $900 per ton. The vein is six ft wide. The ore shipped last season brought $32,000, running from 450 ounces silver and 55% lead to 1,105 ounces of silver. There are 500 tons on the dump of high-grade ore.

UTAH BOY.—Is a chloride ore, and assays from 450 to 1,000 ounces of silver, and is an extension of the Ramshorn. It has a shaft 40 ft and a tunnel on the vein 75 ft, and a vein of 7 ft of ore.

BEARDSLEY AND HOOD.—The ore is a carbonate-galena, and averages 100 ounces of silver to the ton. The Beardsley has a three-ft vein and an incline 70 ft; has ore on the dump and is improving as the incline advances. The Hood is in chimneys from 2 to 20 ft in thickness. These two mines shipped to Salt Lake last season 44,000 pounds of good ore. The Hood has a tunnel run on the vein 140 ft, and a large amount of ore on the dump ready for smelting.

EXCELSIOR.—It is a carbonate-galena ore. The vein is 18 inches wide. There are 100 tons of ore on the dump, which assays from 50 to 200 ounces of silver.

POVERTY FLAT.—They have a vein of three ft of chloride ore. Have run an incline upon the vein 50 ft, and have dumped a large quantity of ore.

VERMONT.—Is a chloride vein assaying $900 to the ton, the vein matter averaging 10 ft in width. Has shipped over 10,000 pounds the past season. They have run one incline 90 ft, and have good rich ore along the vein 500 ft.

BROADWAY.—Are sinking a shaft, and are down 60 ft on an average four-ft ledge of chloride ore, assaying from 700 to 1,000 ounces of silver across the vein, and a galena vein adjoining, assaying from 200 to 300 ounces of silver, while alongside they have a vein of copper glance, which they are shipping to Salt Lake.

IXO AND UNO.—Have veins averaging four ft at a depth of 50 ft.

EMMA.—It shows, at the bottom of an incline of 50 ft, a vein of chloride ore, which assays from 150 to 900 ounces of silver.

BUFFALO & ATLANTA.—*Statesman*, Mar. 11: The tunnel will cut the vein at a depth of 900 ft and extended to the eastern boundary, where it will be 1,800 ft below the surface. It has a double track high enough to work horses or mules in hauling the cars out to the dump and return. It is in 1,400 ft. The south wall of the lode has been cut and the tunnel run diagonally across the vein for 100 ft. The north wall has not been reached. The ledge where the tunnel has cut into it assays from $25 to $300 per ton in gold and silver.

MONARCH.—Has been worked for 10 years and produced in gold and silver over $600,000. It consists of 1,600 ft on the vein, and has been opened to the depth of 300 ft. Drifts and crosscuts run for almost the entire distance of the claim. The ore from which the above money was taken was of high grade, giving by fire assay from $500 to $6 000 per ton, and there is in the mine in sight over 25,000 tons of ore, which will assay from $50 to $100 per ton in gold and silver.

OLD CHUNK.—There are three tunnels, one near the surface 400 ft long, in which was found rock, mostly gold bearing, worth $20 per ton. The second tunnel was run 40 ft below the first for 175 ft, and the same character of ore met with. There is an immense body of ore of this grade in sight. The third or lower tunnel is run 500 ft. At 400 ft from the entrance the ledge was found to be 25 ft wide. An average of the whole ledge shows, by fire assay, $55.55 per ton, 40% of which is gold and the balance silver.

MONTANA.

BELL.—Butte *Miner*, Mar. 9: The work of development is being mainly prosecuted through the middle one of the three shafts. A great deal of free ore has been taken out of the first level, which, at a depth of 40 ft from the surface, extends east 40 ft and west 100 ft, and operations are now chiefly conducted on the second level 70 ft below, which is being pushed both east and west. In the west level the ore body is five ft wide, and has been stoped out almost to the upper level. The ore now being mined is exceedingly rich in both silver and copper, carrying 80 ounces of the former and 35% of the latter. The ore vein along the entire length of this level, with the exception of a few ft, is strong, and has every indication of permanence. Is being close to the west line, downward development awaits the erection of pumping machinery. In the west or main shaft, which has attained a depth of 145 ft, a crosscut will be run to the vein, which carries a high percentage of copper, as well as assaying well in silver. Before the ledge pitched from the shaft, 30 tons of ore were extracted and sacked for shipment, which contained 47% copper and 40 ounces in silver, some of the second-class ore extracted carrying a little less. Operations on the Bell have always been profitable, 1,500 tons of ore having been taken out, the average value of which was not less than $00.

OREGON.

MINING ITEMS.—Jacksonville *Sentinel*, Mar. 17: Two Indians prospecting on Scott river found a nugget weighing four and one-half ounces. The Squaw Lake company has ample water, and is piping dirt through their flume very fast. Piping at McCall & Anderson's diggings, near the Eagle mills, is going on. These claims have always yielded handsomely. The Sterling company is working with a very light head of water, their ditch being only one-third full, owing to the exceedingly cold nights. Cleaning up has commenced at the Centennial, in the Willow Springs district, on account of the failure of water. Keaton, Klippel & Co., on Poorman's creek, are still working with a full head of water in good paying ground. They have already moved twice as much ground as was moved the whole of last season. At the Star Gulch mine a partial clean-up was made, amounting to 60 ounces of dust valued at $1,122. W. G. Kenny, just returned from Josephine county, tells us that the Messrs. Wimer have struck it rich in their hydraulic claim near Waldo. The claim is now well opened, and a stratum of gravel, several ft in thickness, that prospects a bit to the pan, or over $3 to the cubic yard, has been developed.

UTAH.

HIGHLAND CHIEF.—Salt Lake *Tribune*, Mar. 21: This mine is located in Little Cottonwood canyon, $00 ft from and above the Emma, in a northwestern direction. The discovery shaft is an incline of 250 ft, which is intersected by a tunnel 640 ft in length. An incline 350 ft in length extends below the tunnel level, cutting the vein the entire distance, which is from one to six ft in width. It has produced over 1,900 tons of ore, average value per ton 28% lead and 34 ounces silver, yielding about $65,000.

OREGON.—Is in the Big Cottonwood district; at a depth of 350 ft an ore body of fair grade has been found, which is supposed to be the main chimney of ore found at the west end of the shaft and dipping east. The first west winze is in fine ore with walls as smooth as a mirror. They are sinking the main shaft rapidly, and will soon have it 100 ft deeper.

YESORA.—Is in Tintic district, and has produced $35,000 worth of ore. The ore goes from $50 to $60 per ton, and carries gold, silver and copper.

INDIANA.—Is at Bingham. A tunnel has been run on the vein 145 ft, showing an average of four ft of free milling ore.

DIAL.—The tunnel is being driven on the vein, which shows at the face a fine body of carbonate ore of 35% lead and from 10 to 135 ounces silver and $5 gold. A shaft is down 160 ft. Forty ft from the bottom ore was struck carrying 140 ounces silver. The mine is situated opposite the Winnamuck and close to the Bingham Canyon railroad.

HAP HAZARD.—A tunnel of 80 ft has been run on the vein, showing an average of four ft of ore. The pay streak shows gold, silver and lead, and brings in the market $50 per ton. A new tunnel is being started to tap the ledge, which will cut it at about 220 ft deep.

THOR.—Is on the west side of South Fork, 3,000 ft south of Kesler's peak. The ore assays over 80 ounces silver and 40% lead.

News in Brief.

THE Chinese exodus to the East still continues.

THE negro laborers are on a strike in St. Charles parish, La.

THE distress in the famine districts of Ireland is deepening daily.

THE Assembly is still wrestling with the Parks Drainage bill.

A SHARP shock of earthquake occurred at Los Angeles March 21st.

THE President has nominated Bret Harte to be Consul at Glasgow.

ANOTHER plan is out for a ship railway across the Isthmus of Darien.

BREAKS in the levees between Memphis and Vicksburg are reported.

THE Legislature is still industriously at work on the McClure charter.

THE cigarmakers' strike at Cincinnati has ended, after lasting four weeks.

The Duchess of Marlborough says there is now no fear of famine in Ireland.

THE Rhode Island Democrats have nominated Horace M. Kimball for Governor.

THE Kamloops outlaws have been sentenced to death at New Westminster, B. C.

MISS LOU M. JAMES, aged 17 years, committed suicide at San Jose Saturday night.

THE workmen at the Mare Island Navy Yard will have to labor ten hours a day hereafter.

IN San Francisco half dollars are quoted at par; Mexican dollars, 91 buying, 91½ selling.

A RAILROAD is to be built from Bismarck, D. T., to the Black Hills, a distance of 250 miles.

THE Secretary of the Territory of Arizona has been arrested for violating the revenue law.

A NUMBER of the bondsmen of Shaher, Treasurer of San Francisco, have withdrawn from his bond.

Two grain-laden propellers have arrived at Toledo, O., the earliest grain arrivals known at that port.

SILVER in London March 22d, 52⅞d; consols, 97 15-16; 5% United States bonds, 105; 4s, 108½; 4½s, 110¼.

DANIEL CONWAY, of Erie, Pa., has become violently insane in attempting to solve the "fifteen puzzle."

IMMENSE numbers of guns have been made in England and shipped to China for use against the Russians.

THE United States Circuit Court at San Francisco has decided that the law prohibiting the employment of Chinese by corporations is unconstitutional.

Liverpool Metal Market.

We are indebted to James Lewis & Son's Monthly Report of March 1st for the following items :

Copper—The quotations were for bars, good ordinary brands, £70 10s to £71 per ton; best brands, £71 to £71 10s, and £71 10s to £72 for G. O. B.'s with forward delivery. Ore, 14s 9d to 15s; regulus, 15s to 15s 3d per unit. Sales, regulus, 613 tons at 15s; ore, 5,166 tons at 13s 0½d to 15s 3d; precipitate, 358 tons at 14s 7½d to 15s 3d, all per unit. Stock on hand equal to 29,953 tons fine against 30,506 tons on February 1st.

Lead has declined to £18 15s to £19 5s per ton for ordinary shipping brands, and £18 2s 6d to £18 7s 6d per ton for Spanish soft silver.

Antimony unchanged, £71 to £73 per ton for French Star regulus.

Tin has fallen £6 per ton to £92 10s to £93 for Straits and Australian, and £97 to £99 per ton for English.

Manufacture of Leather Belting.

Much of the belting that has heretofore been used on this coast has been brought here from the East. The greatest portion now used here is manufactured in this city. It possesses the great advantage over Eastern belting in being made of oak-tanned leather. The oak bark being so much more plentiful here, and consequently cheaper, the Eastern manufacturers cannot compete with our own for this class of leather. The most of the Eastern belting leather is tanned by chemical process, which, while it expedites the manipulation, has a tendency to detract from the tensile power. It occupies over three months to perfectly oak-tan belting leather. Sole leather is simply tanned. The work upon belt leather is more complete.

In all positions where the belting can be kept dry, leather belting will outlast any other kind. India rubber belting will not stretch as much as leather where it is brought in contact with water; but it wears out sooner than leather, even in those positions. When they begin to wear, it is very difficult to repair them; and there is no limit to their stretching, as there is in the case of leather.

The average strain which leather will bear is 3,200 lbs. per square inch of cross section. A very superior quality will sustain a greater strain. Belts should not be subjected to a strain of more than 1-11th of their tensile strength, or 290 lbs. to the square inch of cross section. The strain is in direct proportion to their thickness. The working adhesion is in proportion to the belt contact with surface of pulley. They should always be worked with the grain side to the pulley, and a much greater effect will be produced by having the pulley covered with leather.

The manufactory of L. P. Degen, at No. 10 Fremont street, in this city, uses over 500 sides of superior belting leather per month. He has it tanned under his supervision and directions expressly for his own use. His factory has been in operation four years, and his business is constantly increasing. He produces belts of all sizes, from the very narrowest to the widest. He can turn out belts 60 inches wide, although the widest in general use is 32 inches. He uses none but the oak-tanned leather, and the larger belts are always cut from the center of whole hides, as that portion of the leather is the firmest and most durable. Belts are made of double or single thickness. The double belts are firmly and compactly riveted. All the belts of his make pass under his personal inspection, and are soaped, scoured and stretched by the latest improved machinery. The belting is subjected to a stretching process which, while it does not deteriorate from its tensile power, prevents that tendency to stretching when in use that causes so much annoyance to those whose machinery it keeps in motion.

Those who wish to obtain as good an article of belting as can be found in San Francisco, would find it to their advantage to examine the belting which he manufactures and offers for sale.

Pacific Iron Works' Circular.

We have received this week the "Circular and Pattern List" of the Pacific Iron Works, of this city, a handsomely illustrated and printed pamphlet, of some 120 pages. The engravings represent the different forms of pumping and hoisting machinery, mills, furnaces, sugar machinery, etc., etc., of which the Works make a specialty. The circular also contains a good deal of material of value to mining men, such as water-tables, water required for pans, for settlers, stamps, boiler, dry and wet crushing mills, etc., etc.

The Pacific Iron Works have now been in successful operation for the past thirty years, and have been intimately connected with the mining developments and industrial progress of the States and Territories of the Pacific coast during that time. From a comparatively small beginning in 1850, its increasing patronage has continually demanded enlarged facilities, until the establishment will now compare favorably in all its appointments with any similar one in the country. The several departments are well equipped with the most efficient tools and appliances, enabling the Works to execute orders of any magnitude required, in a superior manner and in a short time.

The illustrations and descriptions contained in the circular give a fair idea of our progress in everything relating to mining machinery and the various mechanical interests of the coast. Carefully prepared plans and specifications relating to all branches of work are furnished, with estimate of cost when desired. The Works make a specialty of mining machinery of all kinds, and particularly mills and furnaces. The circular is tastily printed, and is worthy of preservation for reference for the information it contains.

A DISPATCH from Paris, under date of March 6, says: M Dauhourg, a French engineer, claims that he has devised means for transporting large vessels over isthmuses, however steep, and an experiment is shortly to be made at Argenteuil by lifting a ship of 2,000 tons from the River Seine and taking it on rails to another point on the river.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

[From Official Reports for the "Mining and Scientific Press," Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

FOR THE WEEK ENDING MARCH 16, 1880.

235,518.—PRESERVING EGGS—A. Good, S. F.

225,608.—SIEVE PROTECTOR FOR THRESHING MACHINES—T. J. Hubbell, Pescadero, Cal.

225,653.—SAFE FOR PROVISIONS—D.N. Smith, San Bernardino, Cal.

225,671.—GEARING MECHANISM FOR STRAW CUTTERS—J. Weichhart, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention :

SIEVE PROTECTOR FOR THRESHING MACHINES. Thomas J. Hubbell, Pescadero, Cal. Patented March 16, 1880. No. 225,608. This invention relates to a novel attachment for threshing machines, which enables a greater increase in the capacity and efficiency of the cleaning sieves; and it consists in the employment of a peculiar guard or protector, which is suspended directly above the shoe, so as to receive the grain, chaff and what straw may fall from the carrying-belt, and which usually falls directly upon the sieves. In ordinary machines the greater bulk of the long straw is carried away over the tail of the machine by the straw-carrier; but the great majority of the chaff and some of the straw will pass down upon the sieves with the grain, and it falls in such a quantity that it is very difficult for the best cleaning shoes to properly dispose of the amount of grain which the machine is capable of threshing. This guard or protector is intended to receive the mass as it falls from the draper or carrying-belt and distribute it, cleaning away also the most of the straw and chaff by an independent shaking device, so that the sieves in the shoe can act much more perfectly.

New Railroad Developments.

The following correspondence of the S. F. *Bulletin*, from Centerville, Alameda county, Mar. 21st, contains information of general interest and importance:

In an interview with Thomas Carter, Superintendent of the South Pacific Coast railroad, he said that the trains would run through to Santa Cruz about the middle of next month, and on May 1st there will be a new time-table used and a formal opening of the road for business to Santa Cruz. The first through train on the new table leaves San Francisco at 6:30 A. M., and the last at 4:30 P. M.; returning trains leave Santa Cruz at 4:45 A. M.; the last at 2:50 P. M. There will be three through passenger trains and one freight each way, also hourly communication with Alameda, commencing at 6:30 A. M. and ending at 8:30 P. M. In going through the tunnel at Wright's on Saturday we found the timbers all up, and, as W. H. Martin (one of the contractors) said, practically finished, there remaining some sills to be changed where the ground has swollen and broken the old ones; and the removal of rock which has dropped from the cars in carrying the dirt out. The tunnel has an elevation of 10 feet in the center to allow a good drainage of the water which drips through in some parts. The locating of this tunnel was done about three years ago by E. H. Mix, Chief Engineer of the road, and came out exactly. There is a good circulation of air through it, and sometimes during the day there is breeze enough to blow out a candle. There is no more danger of explosions from gas. Mr. Martin said the people generally did not understand how the gas occurred that caused the explosions. It lay in seams, and when broken open would burst out suddenly, the heavy pressure behind forcing the tunnel full in a few moments. Until they found how it was, the engineers could not avert the explosions. Since then they have used the blower. To give his words: "We have struck a seam that if it was exploded would have blown up the whole mountain. The whole place for a mile or so smelt of gas for a week, but when mixed with the outside air it became too weak to ignite."

This road has just received two new freight engines from the Baldwin Locomotive Works. They are the largest on the road. No. 3, 9 and 10. They are being put together at the San Jose round-house. They will be completed by Wednesday, and are designed for the heavy work between San Jose and Santa Cruz.

Our Newspaper Binder.

We now offer our subscribers a durable and handy self-binder for this paper. It is made of stiff cloth sides with adjustable, elastic fastenings. It is simple and cheap. Price, $1. To our subscribers, 75 cents. Sent postpaid to any address in the United States. If not satisfactory on examination, return it and we will refund the cash.

REMOVAL.—We call attention to the removal of the Vulcan Powder Company's offices to 218 California street. See notice in another column.

A VETERAN PIONEER GONE.—Mr. John A. T. Overend, a well-known pressman and inventor of this city, died on Sunday last of paralysis. He has been a resident of California since 1850, and was at various times head pressman on the *Times*, *Transcript*, *Alta*, *Bulletin* and *Call*. For the past seven or eight years he has been proprietor of the steam power works on Commercial street, from which power was furnished to many offices in the vicinity. Mr. Overend was an ingenious inventor in his special line. He was the patentee of a device for cutting printers' leads, a type-casting and finishing machine, and a combined pump condenser and heater. Most of his inventions were successfully introduced. He was still perfecting other, and as he believed more important inventions. A man of quiet, industrious habits, he was almost universally respected by those who knew him.

THE Workingmen of this city have nominated J. Richard Freud as Senator in place of Desty, disqualified. He has been endorsed by the Democrats, and will vote for a Democrat for U. S. Senator. The Republicans have renominated J. M. Byrnes.

RAINFALL IN TWENTY-FOUR HOURS.

.38						

Total rain during the season, from July 1, 1879, 14.45 in.

Various Causes—

Advancing years, care, sickness, disappointment, and hereditary predisposition—all operate to turn the hair gray, and either of them inclines it to shed prematurely. AYER'S HAIR VIGOR will restore faded or gray, light or red hair to a rich brown or deep black, as may be desired. It softens and cleanses the scalp, giving it a healthy action. It removes and cures dandruff and humors. By its use falling hair is checked, and a new growth will be produced in all cases where the follicles are not destroyed or the glands decayed. Its effects are beautifully shown on brashy, weak, or sickly hair, on which a few applications will produce the gloss and freshness of youth. Harmless and sure in its operation, it is incomparable as a dressing, and is especially valued for the soft luster and richness of one it imparts. It contains neither oil nor dye, and will not soil or color white cambric; yet it lasts long on the hair, and keeps it fresh and vigorous.

FOR SALE BY ALL DEALERS.

FRESH attractions are constantly added to **Woodward's Gardens**, among which is Prof. Gruber's great educator, the Zoographicon. Each department increases daily, and the Pavilion performances are more popular than ever. All new novelties find a place at this wonderful resort. Prices remain as usual.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription, and request that they circulate the copy sent.

EXTRA COPIES can usually be had of each issue of this paper, if ordered early. Price, 10 cents, postpaid.

Chew JACKSON'S BEST Sweet Navy Tobacco

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Atlanta Mining Company.—Location of

principal place of business, San Francisco, California. Location of works, West Tintic Mining District, Juab County, Utah.

Notice is hereby given that at a meeting of the Board of Directors, held on the Second day of January, 1880, an assessment (No. 1) of Five Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, room 7, No. 420 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Fifth (5th) day of February, 1880, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Friday, the Twenty-seventh (27th) day of February, 1880, to pay the delinquent assessment together with costs of advertising and expenses of sale. By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—Room 7, No. 420 Montgomery street, San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Thursday, February 26th, 1880, and the day of sale to Monday, the 22nd day of March, 1880. By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—Room 7, No. 420 Montgomery street, San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Wednesday, the 17th day of March, 1880, and the day of sale to Saturday, the 10th day of April, 1880. By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—room 7, No. 420 Montgomery St., San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Friday, the ninth day of April, 1880, and the day of sale to Wednesday, the fifth day of May, 1880. By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—Room 7, 420 Montgomery St., San Francisco, Cal.

Cataract and Wide West Gravel Mining

Company.—Location of principal place of business, San Francisco, California. Location of works, Eho Mining District, Calaveras County, California.

NOTICE.—There are delinquent upon the following described stock on account of assessment levied on the 2nd day of February, 1880, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law and an order of the Board of Directors made on the 2nd day of February, 1880, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the Company, No. 20½ Kearny street, San Francisco, California, on Monday, the 20th day of March, 1880, at the hour of 10 o'clock A. M. of said day, together with costs of advertising and expenses of sale.

WM. B. LAKE, Secretary.

Office, 20½ Kearny street, San Francisco, California.

Consolidated Pacific Mining Company.—

Location of principal place of business, San Francisco, California. Location of works, Bodie Mining District, Bodie, Mono County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the Thirteenth day of March, 1880, an assessment (No. 1), of One Dollar per share was levied upon the capital stock of the corporation, payable immediately in lawful money of the United States, to the Secretary, at the office of the Company, 330 Pine St., room 5, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Sixteenth day of April, 1880, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Saturday, the Eighth day of May, 1880, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Directors.

F. E. LUTY, Secretary.

Office—No. 330 Pine street, room 5, San Francisco, Cal.

Gover Mining and Milling Company.—

Location of principal place of business, San Francisco, California. Location of works, Amador County, near Drytown, California.

Notice is hereby given that at a meeting of the Directors held on the Eighth day of March, 1880, an assessment (No. 41) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, No. 402 Front street, room 8, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Twelfth day of April, 1880, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the Third day of May, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

W. O. WILSON, Secretary.

Office—402 Front street, room 8, San Francisco, California.

Rocky Point Mining Company.—Location

of principal place of business, San Francisco, California. Location of works, Placer County, California.

NOTICE.—There are delinquent upon the following described stock on account of assessment (No. 2) levied on the 14th day of January, 1880, the several amounts set opposite the names of the respective shareholders, as follows:

SAVE YOUR GOLD!

Highly Important to Miners and Quartz Mill Men!

SILVER PLATED AMALGAMATING PLATES.

The best process yet discovered for saving fine or float gold. Extensively used with great success in gravel and quartz mining in various parts of the Pacific Coast. Over one thousand orders have been filled, and the demand is constantly increasing. Old Mining Plates bought or taken in exchange for new Silver Plated Plates. Gold extracted from old Plates at a moderate cost. Old Plates (which often contain a surplus of gold above the cost of plating) can be re-plated.

With the most extensive facilities on the Pacific Coast, orders can be filled very promptly and satisfaction guaranteed. All kinds of metal goods plated. Send for circular.

Rotary Pulverizer,

(WHITE'S IMPROVED,)

For Disintegrating Ores and Other Substances.

GUARANTEED TO BE EQUAL IN CAPACITY TO A

HUNDRED STAMP BATTERY!

IS FITTED UP WITH

Homogeneous Steel Beater Bars.

Found to be more durable than either Hard Steel or Soft Iron. Dry-crushing the hardest rock; will last for months, and without the slightest danger of breakage.

The Pulverizer requires about one-third the power usually expended for the reduction of the same amount of Ore by Stamps.

Price List, Etc., of the White Rotary Pulverizer.

No.	Tons Per Hour.	Inches Diameter.	Revolutions Per Minute.	Horse Power Required.	Shipping Weight.	Lumber Required.	Price.
1	6	56	600	40	12	6,000 ft.	$5,000
2	10	72	470	60	15	9,000 "	8,000
3	10	84	400	75	20	12,000 "	10,000

The Repairs on the Pulverizer will not exceed those of a 10-Stamp Battery.

The Shipping Weight of the entire apparatus is not one-eighth of that of Stamp-Mortars required to do an equal amount of work. ☞ It can be placed and put running at the Mill in from fifteen to twenty days.

Address GEO. W. WHITE, Inventor.

Office and Manufactory, 130 Beale Street, San Francisco.

SHEET IRON PIPE.

SUPERIOR TO THE CORLISS!

Our New Automatic Engine.

First—The Corliss Engine cannot, as a rule, take steam beyond two-fifths the stroke—unless it takes it all the way.

We can take five-eighths or three-quarters, or even more, if needed, and at the same time work down to one-tenth or one-twelfth, and get a good engine port

Second—The Corliss cannot, without sacrificing some of this two-fifths and reducing its range of governing to a minimum, give any exhaust lead or cushion. The consequences of this is that Corliss Engines of almost every builder thump badly, and also need to be much larger than is absolutely required, so as to be ready for emergencies. It is plain that an engine that can give only two-fifths of a stroke cut-off is not to be relied on for sharp work under heavy change of load and must have a heavy fly-wheel to steady it.

We can give just what we need. Our New Automatic has trunk frame like the Corliss, but has rotary valves, both at bottom of the cylinder like the Wheelock. This is to save clearance. The valves are operated by cam motion, thus giving the most perfect opening and closing known. The valve opens full width and no further, and shuts just enough for safety. This saves wear and tear of reciprocating parts. Two eccentrics operate valve gear—one fixed, giving an invariable point of opening the steam and exhaust and closing the exhaust. The movable eccentric controlled by a rotary governor fixed on main shaft, where it can never get away, controls the closing, the valve being alternately controlled by the two eccentrics. No dash-pots nor noise, and the most exquisite adjustment.

We have two of these Engines already on the way, for parties on this coast.

NOW READY!

OF IMMENSE PRACTICAL VALUE TO EVERY SAW USER.

GRIMSHAW on SAWS!

History, Development and Action; Classification and Comparison; Manufacture, Care and Use of SAWS of all kinds. Quarto. 234 Illustrations.

By ROBERT GRIMSHAW, Ph. D., M. E.,

Member of the Jury on Wood-working Machinery at Paris Exposition of 1878.

This thorough work, impartially written in a clear, simple and practical style, treats the Saw scientifically, analyzing its action and work, and describing, under the leading classes of Reciprocating and Continuous Acting Saws, the various kinds of large and small hand, sash, Mulay, jig, drag, circular, cylinder and band Saws, as now and formerly used for crosscutting, ripping, scroll-cutting, and all other sawing operations in wood, stone and metal, ice, ivory, etc., in this country and abroad. With appendices concerning the details of manufacture, setting, swaging, gumming, filing, etc., tables of gauges, log measurements from 10 to 24 feet, and from 12 to 96 inches, lists of all U. S. Patents on Saws from 1790 to 1880, and other valuable information. Elegantly printed on extra heavy paper, wide margin, copiously indexed.

Owing to an increase of nearly 100% in number of pages and illustrations since first projected, the price is this date made $2.50, postage paid

ROBERT GRIMSHAW,

624, 626 and 628 Market Street, Philadelphia.

March 10, 1880.

Kendall's Spavin Cure

Is a sure cure for spavin, splint, curb, callous, sprains, swellings, galls, lameness and all enlargements of the joints or limbs. It will completely remove a bone spavin without blistering or causing a scar. It is also as good for man as for beast, and is used full strength at all times of the year with perfect safety. A cure which we are knowing to is a person who suffered 15 years with hip-joint lameness and was permanently cured two years ago with Kendall's Spavin Cure. Remember we claim it will cure a bone spavin and completely remove the bunch without blistering.

Office U. S. Marshal, Western Dist. of Michigan, }
Kalamazoo, April 15th, 1879. }

B. J. Kendall, Enosburgh Falls, Vt.—DEAR SIR:—I received the two bottles of your spavin cure forwarded by express in January last. I am happy to state that it performed all your advertisement called for. In three weeks after I commenced using it the spavin was entirely removed and a valuable horse restored to usefulness. Very truly yours, JOHN PARKER.

Send for illustrated circular giving positive proof. Price, $1 All Druggists have it or can get it for you.

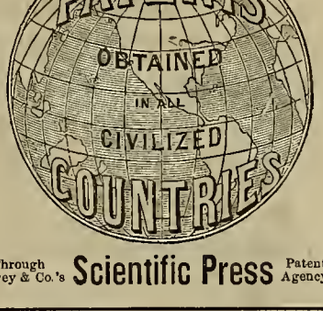
SECURE PATENTS



Through Dewey & Co.'s **Scientific Press** Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long established, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free. DEWEY & CO., PATENT AGENTS.

A. T. DEWEY. W. B. EWER. GEO. H. STRONG.

VULCAN BLASTING POWDER.

The Strongest, Safest, Most Uniform and Reliable "HIGH EXPLOSIVE" Manufactured on the Coast.

MINERS TESTIFY THAT IT IS FREE FROM OBJECTIONABLE FUMES.

We call the attention of all desiring such a Powder to our various grades, which we are prepared to sell at LOWEST RATES.

No. 1.—Equalling Liquid Nitro-Glycerine in Strength. We recommend this Grade in extremely hard rock, boulders, iron, etc.

No. 2.—Will do the work thoroughly in all but the hardest kinds of rock.

No. 3.—For bench work, pipe-clay, soft and shelly rock, outside work and quarrying.

Single and Triple Force Caps, Fuse of all Grades, Vulcan Powder Thawing Boxes, Batteries and Exploders, For Sale at the Lowest Rates.

VULCAN POWDER COMPANY,

Office, 218 California Street, - - - - - SAN FRANCISCO, CAL

A. S. HALLIDIE.

Office, No. 6 California Street,

SAN FRANCISCO.

Manufacturer and dealer in all kinds of

Iron and Steel Wire Rope,

Flat and Round, for Mining, Shipping, Hoisting and General Purposes.

Having the most complete and extensive Wire Rope Works in the United States, I am prepared to manufacture Wire Rope and Cables of any length or size at short notice, and guarantee the quality and workmanship equal to any made at home or abroad.

Iron, Steel and Galvanized Wire

Of all sizes on hand or made to order.

Barbed Fence Wire.

Sole Proprietor of

Hallidie's Endless Ropeway,

For the Transportation of Ores, Etc.

☞Send for a Circular.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers. SAN FRANCISCO, SATURDAY, APRIL 3, 1880. VOLUME XL. Number 14.

The Buckeye Engine.

The Buckeye engine has been before the public for some oight years, during which time it has, whilo retaining its original goneral plan, undergone several valuahle improvements, and is now thoroughly perfected in all its parts and functione. One of these enginee is at work in this city at tho Union Box Factory, where it has given the greatest satisfaction, doing the work required with very mncb lese fuel than was formerly nsed. It is considered in the East, where it is largely in use, as the hest of ite clase, as proved in many instances hy the indicator diagrams.

Fig. 1 of the engravings gives a front view of the engine. Fig. 2 is a horizontal eection throngh the valve and cylinder, and Fig. 4 illustrates the peculiar governor. The live steam enters at A, Fig. 2, whence it passes throngh passages *a*, *a''*, and the open pistone, *D*, *D*, into the interior of the hox slide-valve, *B*, *B*, as shown hy the arrows. From the hox-valve the steam is admitted to the cylinder through ports, *b*, *b*, in its face, as these porte are alternately hrought to coincide with the cylinder ports.

The cut-off valve, which consists of two light platce, *C*, *c*, connected by rods, *C'*, works on seats inside of the main valve, as shown, and alternately covers the ports leading to the cylinder. The cnt off valve stem, *g*, works through the hollow etem, *G*, of the main valve. The exhaust takes place at the ends of the valve (as ehown hy arrow on right), into the valve chest and into the exhaust pipe, *F*, helow.

Among the features introduced since the first introduction of the engine, are the relief chamhere, *e*, *e*, in valve seat. To understand the use of theee it must he underetood that, the steam heing *inside* of the slide valve instead of *around* it (as with the common elide-valve), the tendency of the pressure of the steam in the ports, *b*, *b*, and in the cylinder is to force the valve from its seat, hut this tendency is counteracted hy the pressure of the entering steam; this pressure heing proportioned to the area of the pistons or equilibrinm rings, *D*, *d*, *D*, *d*. These pistons are made large enough to hold the valve to its seat at the moment of admission (as at left end of valve, Fig. 3), when the tendency to leave the seat is greatest. At other times the pressure on the seat would be greater than neceesary; but to prevent euch undue pressure, live steam ie admitted to the relief chambers, *e*, *e*, through small holes, *f*, *f*, in the face of the valve just after it is exhaueted from the cylinder, as shown at the right hand end of valve Fig. 3, and in turn exhausted from them, as shown at the left, jnst before steam is admitted to the cylinder. The result is a moderate and very nearly a uniform pressure on the seats at all points of travel, and the arrangement also greatly assists in the proper distribution of luhrication.

Another recent improvement consists of placing the equilihrium rings in the back cover of the valve chest, instead of in the cover of the valve, as formerly. The value of this improvement consists mainly in its rendering the equilihrium rings accessihle without removing the valve.

The remarkahle simplicity [of the governor will he apparent on inepection of Fig. 3. Two levers, *a*, *a*, are piveted to the containing case or dise at one of their ends. as at *b*, while the movahle ends aro connected hy links *B*, *B*, to ears or flanges on the eleeve of the loose eccentric *C*, eo that their outward movement in obedience to centrifngal force (as indicated by dotted lines on right hand side) advances the eccentric forward in the direction of revolution. Springs *F*, *F*, of tempered steel wire furnish tbe centripetal force. The tension of the eprings ie adjnstahle hy screws and nuts, as shown. The proper amount of tension in any given case ie that which will confine the percentage of variation due to changes of load and preseure within as narrow limits as may he desirahle—the greater the tension the less the variation—eo that if desirable it may he reduced nntil it is imperceptihle. In fact, it ie possihle to ohtain as close regulation with it as the nature of the load and other conditions outside of the construction of the engine would permit with any known method of regulation. The proper speed is ohtained hy adding more or less weight at *A*, or, within certain limits, hy shifting the weights along the levers. As a rule, the teneion is not to he changed to effect changee of speed, though slight changes of epeed may properly enough he so effected, provided no ohjectionahle degree of change of sensitiveness rcsults.

The parts are ehown in their proper position for motion in the direction of arrow; for motion in the opposite direction, the levere are changed to *c*, *c*, and the spring attachments to *b*, *b*. All of the governore are so constructed that this change can readily he made at any time.

When the earliest cut-off that the action of the regulator can produce is no earlier than is necessary to restrain the engine nnder its lightest load and greatest eteam pressure, the latest will he at five-eighths to three-fourths of the streke, where it mcets the fixed ont-off of the main valve, due to its lap and angular advance, and this whole range of adjustment is nnder complete control of the governor. To appreciate the value of thie feature, it ebould he underetood that, with single eccentric releasing gear movements, the governor can only control the time of releaee during the opening movement of the valve, wbich necessarily terminates hefore mid stroke, so that if the release is not effected before mid stroke it will not take place at all during that stroke, thus causing extravagant expenditure of steam and epasmodic irregularities in the motion.

The governor being secured directly on the engine shaft, the danager of the cngine hecoming detached from it and destroying itself and the lives of those in its vicinty, is entirely obviated. Such danger always impende when connecting mechanism between the engine and its regulator (particularly helting) is need. Instances of disaster to the engine and driven machinery, involving in many caees the loss of life, from the accidental detachment of the governor from the engine, are numeroue.

The valve-chest contains only exhanet steam; consequently the engine can he run with the cover of the chest removed, and any leakage of the valve located and detected.

This admits of the valves heing fitted tight in the first instance, which ie done hy working them under 80 or 90 pounds steam pressnre, and repeatedly scraping them until all leakage disappears; and it enahles the engineer to inspect their condition at any subsequent time. The valve ie the most practical halanced elide-valve yet devised, with which a siding cut-off valve can be nscd. The close proximity of the valve to the hore ef tbe cylinder, and of the cut-off to the main face, reduces the clearance to from 1½% to 2% of piston displacement when the stroke is twice the hore, whicb is a very important feature, as any engineer knows. The governor is hoth in appearance and effect a part of the engine itself, instead of heing a kind of extraneous disfigurement added to the engine.

A pair of diagrams from this engine were sent to Prof. Hill, of Cincinnati, to determine borse power and water oonsnmption. He saye that if the diagrams repreeent the daily average condition of performance, the engine exhibits an economy hitherto nneqnaled hy a single cylinder etationary engine. The general facts obtained from the diagram were as follows:

Dimensions of cylinder, 22x44; revolutione per minute, 70; cnt-off in parts of stroke, .152; release in parte of stroke, .987; cushion in parte of stroke, .0948; clearance in parts of stroke, .0175; Effective vacunm, inches of mercury, 20.66; initial preesure ahsolute, 78.875 lbs.; cnt-off preesure absolute, 72.50 lbs.; terminal pressnre absolute, 12.125 lbs;. counter pressure abeolute, 3.75 lbs.; mean effective pressure, 30.119 lbs.; water per indicated horee power, 16.327 lbs.; coal per indicated horse power, 1.814.

By the foregoing etatement the economio properties of this engine can he readily understood.

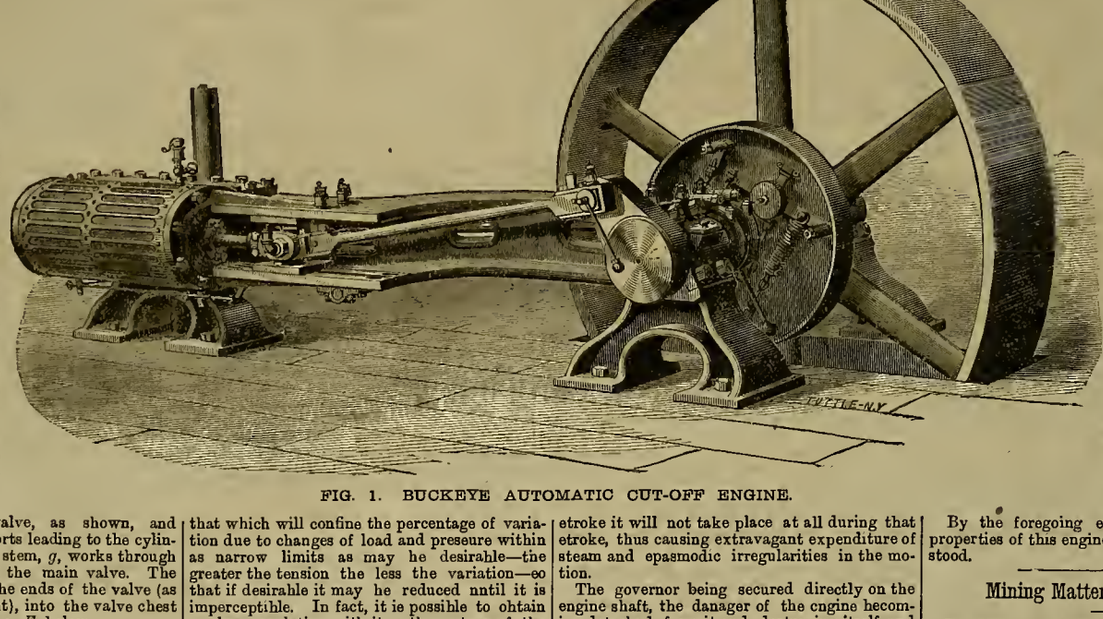

FIG. 1. BUCKEYE AUTOMATIC CUT-OFF ENGINE.

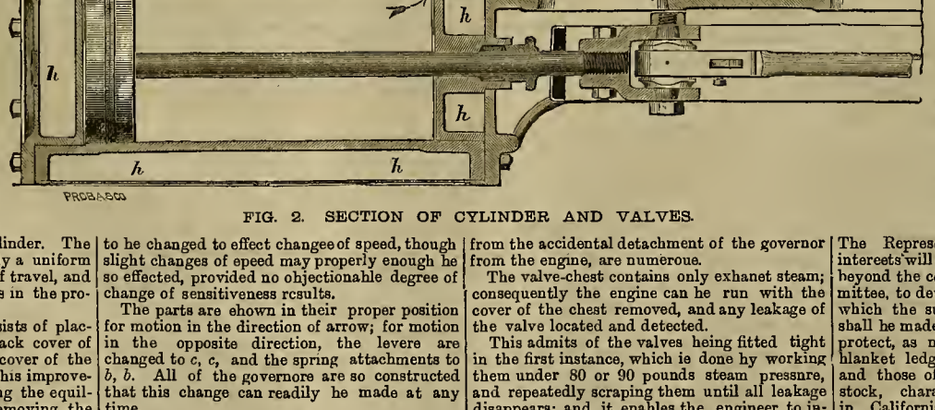

FIG. 2. SECTION OF CYLINDER AND VALVES.

Mining Matters in Congress.

It eeems, as we expected, tbat tbe cbangee proposed by the U. S. Puhlic Land Commiseion in the present mining lawe, are heing vigoronsly opposed even in Congress, especially in the matter of the contemplated aholition of the present system of ledge locations. The dispatches from Washington inform us that the Pacific Coast Senators, Representativee and delegates are in receipt of numeroue letters from conetituents interested in mining, making inquirice as to the prohahilities of favorahle action by Congress upon the recommendations of the Puhlic Land Commission, and almost uniformly proteeting against those features of the Commissioners' hill which provide for the doing away with the present eystem of ledge locations. It eeems to he practically certain, in view of the great pressure of other hueinese, and the magnitude of the qnestions involvedin a numher of the Commissioners' propositions, for radical changes in land laws, that no final action will he taken on their hill, either in the Houee or Senate during the preeent session of Congress. The Representatives of the Pacific elope intereets will endeavor, hefore the subject passes heyond the control of the House Mining Committee, to deviee eome satisfactory provision hy which the surface location of mineral claims shall he made on the pitch of the vein, and thus protect, as nearly as may he, the locator of hlanket ledges, such as are found in Colorado, and those of owners of lodes like the Comstock, characteristic of all mineral veins in California and Nevada, and most of the Territeries. In another column will he found a correspondent's views upon this subject.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds

The Public Land Commission Once More.

EDITORS PRESS:—What advantages would mining operators, or the country generally, derive from mining prospectors heing driven hy ruinous legislation from the field of mineral discovery? The men who would taks their places would be "tendsr-feet" immigrants, wholly insxperienced in respect to the value of ore, or ths promise, or lack of promise, of the lodes they might heppen to find. Ths grocer and the tradesman in Eastern cities, on ascertaining that old prospectors were to he compelled to give up their claims, would, hy their agents, try to secure some of them. With the mistaken idea prevalent on the Atlantic coast, they would suppose that the possession of a silver mine insnred wealth to its owner. They wonld gladly re-locate forfeited ground; hut when they discovered the fact that it needed lahor, skill and patience to make it productive, they would ahandon everything in disgust. A change in the law wonld not bring any more capital into mining business than is coming now. Many of the locatious held at present hy prospectors were taken np years ago, when the country was infested hy hostile Indians. Is it wise or just to roh these men of their discoveries, hecause they are poor? They are waiting in hope that the day may come when capital, turning in their direction, will insure them a homestake. What crimes have these hardy pioneers committed that the Public Land Commission shonld recommend Congress to pass snch onerous laws, as to working on and patenting their mines, that they will virtually he robbed of all they possess?

The complaint, I am aware, is that prospectors take up numerous lodes and, while doing little towards opening them, demand larger prices than investors are willing to give. There is ground for this complaint, hut the evil will speedily cure itself. And are not our legislators to hlame for encouraging thie unsatisfactory state of affairs?

It is only a month ago that a bill was rushed through Congress and hecame a law before the puhlic knew anything of its provisions, the object of which wae to extend the time for doing assessment work on mines to nearly two years, in place of one. It provides that the assessment year shall not hegin until the 1st of January after a location has heen made.

Under thie stupid law, evidently passed for the henefit of some particular district, or clique of operators, a man taking up a claim on the 2d day of January, 1880, need not do any work npon it until Decemher, 1881. After passing such an objectionahle law, will Congress stultify itself hy another enactment requiring work of the value of $500 to be done and a patent to he applied for within a year?

It was while the Public Land Commission was in the throes of lahor (bringing forth a wondrous progeny of absurdities), that Congress passed the law I have alluded to. Was it an anticipatory meaeure to balk the leaked-out designe of the commission? If so, there is some hope for the prospector.

The mining law of 1872 has given general eatiefaction to practical mining men, hut every year some ignorant upstart has attempted to change its wise provisions. The appointment of a Land Commission, to revise it and make eug-geetions ae to our land laws generally, was a hlnnder akin to a crime, inasmnch as the men conetitnting that commission show hy their report to Congress that they are wholly incapable of comprehending the firet principles of the euh-ect they were to examine into.

The hest thing that can be done with that report is to place it where it will do the most good it is capahle of—under the kindling-wood of some capacious stove in the Washington capitol. J. D. EMERSLEY.

Dos Cabezas, Arizona, March 17, 1880.

Reactions of Zanthogenate of Sodium.

EDITORS PRESS:—Since the writing of the article entitled "Tests for Nickel," hy Mr. C. H. Aaron, I have followed the reaction of this reagent etill further, with the appended resnlts:

Nickel—With dilnte solutions a reddish-yellow cloudinese, deepens upon warming, soluhle in ammonia, reprodnced hy acetic acid.

Copper—In dilute solutions, a hright yellow cloudiness, with moderately concentrated eolutione upon agitation, a heavy curdy precipitate, insoluble in ammonia.

Cohalt—A dirty greenish or greenish-yellow cloudy precipitate, insoluble in ammonia.

Magnesium—A hulky white precipitate instantly soluhle in ammonia, after etanding a few minutee reprecipitates in a light, white semi-glutinous mass, soluhle in acetic acid upon warming.

Mercury—With agitation a curdy white precipitate, hoiling, coagulates into a yellowish friahle mass, which floate on the surface of the liqnid, insoluble in ammonia.

Iron—Dirty brown cloudiness, warming with acstic acid disperses the color, leaving a white cloudiness of free sulphur, with ammonia a greenish precipitate of oxide of iron.

Platinum—Bright yellow cloudiness, unlike copper, does not curdle upon agitation, ammonia changes to a flesh red.

Silver—Light yellow precipitate, curdles upon agitation, insoluhle in ammonia.

Zinc—Heavy white cloud, cnrdles upon agitation, instantly soluhle in ammonia, not reproduced hy acetic acid.

Antimony—Whits clond, soluble in ammonia, not reproduced by acetic acid.

Barium, strontium, calcium, gold and arsenic, no precipitats.

All solutions should he nentral, or nearly so.

The aqueous solution of zanthogenate of sodium decomposes in a few honrs, hecoming cloudy. The crystals may be kept ready for use in a dark cool place and in glass-stoppered hottles to exclude the air; they ars readily soluble in water. GEO. F. BEARDSLEY.

Coal Oil Product.

We collate the following from Stowell's *Petroleum Reporter*, Mar. 15th: There were produced in February 1,668,080 harrels, being a daily average of 57,520 harrels. The total stock is 9,073,562 barrels. In snmming up the business of the year (ending Decsmher 31, 1879,) and comparing it with the business of the year preceding, (ending Decemher 31, 1878,) we find:

1. That in the producing region we have added to our stock hy excess of production over shipment, 3,845,191 barrels for the year, being a daily average of 10,535 barrels.

2. That the exporters have taken petroleum largely beyond their needs and the visihle supply of the eix principal European ports at the end of the year shows an excess of ahont 600,000 harrele of refined, equal to 800,000 barrele of crude.

3. Ignoring the fact of the excessive stocks in Europe, or rather treating the foreign ehipments as consnmption, and basing calculation only on the etocke and shipments from the region, we note that the increase in production over the preceding year was 29%, while the increase in consumption was only 16%, and the excess of production for 1879 over demand for 1879 was 23%.

MICA IN COLORADO.—We learn that the mica mine near Currant creek ie again coming to the front. A company which includes among ite numhers prominent officiale of the Atchison, Topeka & Santa Fe road, has possession and will work it with a new purpose in view, which is the manufacture of a new luhricator. Ahout eight men under the euperintendence of Sol. Teal are now opening up the vast heds of mica, the large sheets heing carefully saved for nse as translucent non-conductors of heat in the many forme that ie required, while the *debris* or emall chips and fine particles of mica will he carted to the creek, a short distance off, where a mill, tbat is expected on the ground soon, will grind it into fine powder. The latter, it has been ascertained hy practical test, answers much better, when eaturated with oil, the purpose of a lubricator for railroad car axles and other heavy machinery than cotton and not heing inflammahle the heat of the constant friction does not affect it. There are other pnrpoees to which this eubstance can be advantageously put, as in the manufacture of asbestos and other fire-proof roofing materials, and the manufactnre and packing of dynamite, and it would appear as if, where there ie a whole hill of it as at that place, it could he handled to advantage. —*Fair Play (Col.) Flume, Feb. 26th.*

PROHIBITING INFANT LABOR.—The inspectors of factories in Pruseia are working herd to put down infant lahor. At Berlin, thirty-three factoriee have ceased employing children and in the others there are only nine under fourteen years of age. The same has heen the case innearly all the provinces, notahly in the district of Frankfort-on-the-Oder, where in the 330 cloth factories, employing 14,000 hands, there are now only 1,500 minors, this heing a diminution of 23% since 1876; while in the districts of Cologne, Coblentz and Treves the total number of children employed has fallen from 5,334 to 4,237, the inspectors taking great care, also, that proper sanitary arrangemente are made, and that the masters do all they can to protect workmen from accident. One curious fact hrought ont hy the inspector in Westphalia is the wandering disposition of the workmen. He instances a manufactory, employing 2,000 hands, in which from 100 to 200 of them leave every month.

DITCH ENTERPRISE.—The Calaveras *Advertiser* eays: We understand the Cataract and Wide West Hydranlic mining company of Murphye are ahout to commence digging a new ditch from the North Fork of the Stanislaus river to Murphys, a distance of ahout twenty miles, the eurvey heing nearly completed. This is qnite an nndertaking, hut we have no douht of the Cataract and Wide Weet claim remunerating them for their investment in the end. The claim consists of 160 acres, having an average depth of 100 feet, carrying gold from the surface to the hedrock. We also understand their intention is to dispose of a great deal of water to outside partiee and new minee will he opened up that formerly could not be worked owing to the lack of water. We wish the company success in their efforts.

Recent Decisions Relating to Patents, etc.

We give below brief ahstracts of decisions* rendered upon patent cases in litigation for the henefit of our readers.

Colgate ve. The Gold and Stock Telegraph Co.

U. S. Circuit Court, Southern District of New York. Blatchford, J.:

1. Ths defendant, having been enjoined from using the patented improvements, except the identical wirss and cahles then used hy it, and from authorizing others, "either in whole or in part, or alone, or in conjunction or in connection with ths defendant," from using any such wires or cahles, an agreement, under which the defendant furnished a wire emhodying the invention, contained in a cable which has been in use hy the defendant long before, and which was in actual uss hy it at the time of the service of the injunction, was a violation of the injunction.

2. An agreement involving the furnishing of the infringing device, althongh made hsfors service of the injunction, if executed after such ssrvice, is a violation thereof.

Phillipe et al. vs. The City of Detroit.

U. S. Circuit Court, Eastern District of Michigan. Brown, J.:

1. Letters Patent No. 121,544 issned to R. C. Phillips, for improvements in wooden pavements, are void for want of novelty and invention.

2. A pavsmsnt consisting of a block of wood cnt from the trunks or hranches of trees in their natural form, the hark only heing removed, laid vertically upon a hed of gravel or sand, which is also used as e filling to keep the hlocks in position, is not patentahle.

3. While the fact that a device is useful and has superseded others previously employed for analogous purposes is proper to he considered, and in some cases is decisive, it doee not of itself estahlish the fact of patentahility.

A decree will therefore he entered dismissing the hill.

COMMISSIONER'S DECISIONS.

Ex-parte Wintherlich et al.

Paine, Commissioner. Appeal from the Primary Examiner.

1. Tbe phraseology of the claim—"The process herein described of producing drop-shot from iron hy first melting the iron, then gradually pouring the molten iron upon a revolving hroom composed of parallel fibers, that are continually wet with water, which separatee the molten iron into numeroue solid glohules, that then fall into the water, and are cooled, suhstantially as set forth"—does not necessarily make the immersion and cooling of the globules of iron a part of the process claimed; bnt euch a construction of the language is not violent nor unreasonahle.

2. When the functions of a machine constitute a process, it is as legitimate to claim the process when performed by one as when performed hy several machines; hut it is irregular to claim a process without formerly describing it.

3. Where a process is substantially, though informally, shown in the description of the operation of a machine, the irregularity may he held hy the Commissioner not to he fatal to the application.

The decision of the Examiner reversed.

ACTING COMMISSIONER'S DECISIONS.

Ex-parte Tyne.

Doolittle, Acting Commissioner. Appeal from the Primary Examiner. Decided Jan 2d, 1880. Improvement in packing brooms.

1. To sustain a claim for a mechanical process, the steps taken must he novel, and some means must he described hy which the process can be carried on.

2. It is no objection to the joinder of the claim for a mechanical procese and a claim for an apparatus in the same application, that the process can he carried on hy other meaus if the use of the particular apparatus claimed necessarily involves the operation of the process.

Decision of Examiner reversed.

Hunt vs. King.

Anti-friction hearings for shafts, etc. Doolittle, Acting Commissioner. Appeal from the Examiners-in-Chief.

Drawings made hy an applicant which indicate the invention in controversy, hnt do not show all the parte nor demonstrate its capahility of use, not sufficient to defeat a patentee who was snhsequent to conceive the invention, hut who first made and successfully operated the same.

The decision of the Examiners-in-chief is reversed, and priority awarded to King.

* More complete reports of the proceedings may be found on file in the office of the MINING AND SCIENTIFIC PRESS Patent Agency, 202 Sansome street.

ACTUAL VALUE OF NICKEL COIN.—Reckoning nickel at $2 per pound, the five-cent piece is worth a cent and a quarter. It weighs 77 graine and a fraction. The proportions in the composition of it are 75% of copper and 25% of nickel. Copper is reckoned at 43 cents per pound. If, then, a nickel five-cent piece is lost, the government cleare three and one-half cents on the issue.

A MAN at Dutch Flat, picked up a rock the other day to throw at a cow. The weight of it attracted his attention, and on examination it was found to contain over a hundred dollars in gold.

The Powers of Mining Superintendents.

In the recent case of Everett against the Hukill G. & S. M. Co., of Idaho, Judge Hallett gave soms important points in his charge to ths jury. It eppears that Mr. Cushing, supcrintendent of the company, received from the pleintiff a sum of money, which the pleintiff claimed was for the purchass of ore to he produced, but which the defendaut contends was really a loan under the guise of a sele. The question was as to ths superintendent's power to bind ths company for this money. The judge in his charge laid down the following principles:

1. The superintendent of a mining company has no authority to horrow money so as to hind his principal. That power is bsyond the scops of the ordinary authority of such an agent. It can hs his, only by an authority expressly given; never hy an authority arising hy implication from his appointment.

2. But though the loan would not be hinding primarily, an after ratification hy the principal would make the contract his own, and therefore ohligatory upon him.

3. As to the mode of making ths ratification, it is not necessary that there be an express confirmation of the act of the agent. It is sufficient that the principal, knowing all the essential circumstances, remains silsnt. Silence in such a case will be construed to he assent and ratification.

4. If, howsvsr, he is not in possession of all the facts relating to the transaction, he can, in no respect, he considered as having approvsd and ratified the same.

5. A mining superintendent may hind the company to a sale of ore, a little in advauce of present production. But as such a power is liable to ahuse, there must he limite to its legitimate exercise; and it hecomes necessary to distinguish between an extreme case, as where a sale is made hy the agent of all the ore to be produced for ten years, and the case of the sale of a reasonahle quantity. It is left to the jury to say, baving taken into consideration all the circumstances of the case—the advantages of an advance sale, the neede of the company for advances of money, the daily rate of production and the extent of the future sale—wbether it is a reasonable contract for one in the position of a mining superintendent to make.

The jury hrought in a verdict for the plaintiff.

WORK RESUMED ON THE FAMOUS DEPOSIT IN CHALCHUTL MOUNTAINS.—For the first time in two hundred years the old turquois mine in Chalchutl mountain is being reopened. In 1680 work was suspended on the mine, the cause heing the caving in of the shaft and the subsequent death of some say 25 and others say 100 Indians who were at work helow. An attempt made hy the Spanish to force the Indiaus to begin again and reopen the shaft lod to a rehellion, and probahly was one of the causes which forced the Indians to an uprising and the subsequent expulsion of their rulers from the country. However, it ie hy no means certain that the story of the caving in of the mine is true. That mioe like many others in this country, may have heen filled up hy the Indians after the Spaniards had heen driven out. It is more than prohahle that this mine had heen worked for hundreds of years previous to its ahandonment, as tho turquois wae always the favorite jewel of the western trihes, and was used extensively at the time of the conquest. The extent to which these mines have heen worked may he conjectured hy the vast amount of debrie lying around the old shaft, covering no less than fifteen acres of ground. This mine is the only turquois mine on the continent, and as the gem has always a market value, it will he ere long one of the recognized sources of wealth of this Territory, when the diamond will become as common as brass is now, and turquois, on account of ite rarity, will he in demand and will command a high price.—*New Mexican.*

MINING STATISTICS.—Mr. Clarence King, the head of the Geological Survey, makes a request of Congress which the rapid increase in mining investments throughout the country will cause to be received with general interest. Mr. King points out the fact that only a portion of our great mineral deposits are to he found on the public lands, to which the survey is restricted. An accurate and exhaustive presentation of the mineral resources and prodncts of the country cannot be made unlese the jurisdiction ie extended, as he proposes shall be done hy joint resolution, to the whole territory of the United States. Hie idea would he, he states, to issue an annual volume of statistics on the subject. It is needless to say that such a volume would he sought hy the public with greater interest than usually attaches to Government puhlications. Mr. King predicts for some time in the futnre an annual mincral yield of $1,000,000,000.—*New York Tribune.*

SISKIYOU COUNTY NOTES.—H. C. Cory writes us as followe: More hullion will be ehipped from this county this year than for many years. Fourteen quartz mills are now running; number of stamps in all 118; several new mills will he hnilt. D. B. Kingery hae a seven-foot ledge in his mine on the French Creek lead at a depth of 200 feet, which shows well in free gold; this gives new life to the French Creek mining district. The report is good all over the county; hundreds of new mines are heing opened with very flattering prospects.

MECHANICAL PROGRESS.

Then and Now.

Owing partly to the improvement in tools and shop appliances, and partly to the system of subdivision of labor, there is no parallel by which the workman of to-day can be gauged or compared with the workmen of thirty or forty years ago. Then the apprentice was taught—crudely, perhaps, but still taught—all the mysteries of his calling, from the preparation of the crude material to the finish of the completed result. The carpenter hewed his timber from the tree trunk or limb by means of chalk lins and broadax. He bored, and mortised, and cut tenons, erected the frame of the building, boarded and shingled, and clapboarded and lathed. The blacksmith shod horses and oxen, tired wheels, made bolts and nuts, chipped and filed and drilled, forged and tempered axes and chisels, and performed numberless jobs of a variety of forms and for a variety of purposes. The machinist sometimes made his own patterns and often his own tools, worked at the vise and the planer, the lathe and the forge, and was ready to undertake any job, from repairing a broken stove to building an engine.

Now, timber is sawed and not hewed; mortises and tenons are machine cut; houses are built by the shinglers, the lathers and the joiners, as well as by the carpenters; and the doors, windows, window and door frames and sashes are factory built. The horseshoer does nothing else. The forger of steel seldom works iron. The tool maker is nothing but a tool maker. The machinist is a bench man, a lathe man, a planer, a fitter, or he has a specialty in cotton machinery or woolen, or never works but on steam machinery.

It cannot be expected that the man who has worked only in a certain department will be entirely at home in others; but, on the other hand, he who has worked at all branches will not be likely to be an expert in any one branch. In versatility and in contriving makeshifts, he who learned his trade when the arts were young, and performed a portion of all the work, is better than the specialist; he may be an invaluable man in a crisis. But the latter can prepare a room for the plasterer with much greater rapidity and in better shape than the carpenter who turns from making a door to lathing a room. The tool forger can temper steel better than the blacksmith who turns from the forging of a mill crank to the tempering of a turning tool. The machinist who has worked for years on steam engines can sooner put a disabled engine to work than one who learned his trade at building cotton machinery. In the one case, the man is an expert; in the other, simply a workman.—*Scientific American.*

The Vibration and Fire Risk of High Factory Buildings.

A late article, by a Boston underwriter of textile mill risks, states that in many New England mills the vibration will, in the loftiest structures, cause water to slop over from a pail two-thirds full, if the pail be placed on one of the highest floors. Gas pendants show corresponding vibration (plainest when loosely hinged) by swaying two or three inches. Such tremor, though in less degree, has been noticed in heavily built four-story stone mills, and even in those having iron floors with brick arches. In one of the last-named kind it became necessary, before satisfactory work could be done, to put wooden blocks in the walls, upon which the iron girders might rest. This jarring is not only hard on shafting and hangers, but especially detrimental to cog-wheels and all delicately set machinery.

The *American Exchange and Review*, commenting on these facts, points out that there is another view of this subject, increasing the disadvantages of vibrations. It is in accordance with natural laws, just as iron constantly jarred becomes more granular in form and weaker in cohesive force, that walls of brick or stone subject to constant tremor shall become disintegrated and weakened. In such a case the work of the fire is partly done before ignition commences. The buildings may not fall before a fire, as in the case of the large Pemberton mills some years ago, but when fire attacks a factory whose walls have for years been shaking, as with a chronic chill, the whole building is likely to fall into one mass of ruin early in the fire, or else the fire be much more extended by the falling of some of the long-shaken walls, than if they had been able to resist the suddenly added molecular vibrations of intense heat. There is undoubtedly a difficulty in strengthening wooden girders with iron rods and trusses, for in case of fire such compound girders are weaker than one of wood only, because, trusting to the iron, they are frequently overloaded; and it is during strong heat that the weakness of iron becomes apparent.

Rectangular iron knees, to brace girders to walls are objectionable, because in a fire when the interior pillars yield, the ends of girders in the wall may so hold that the leverage of the long timber will pull the walls inward. It should be remembered that by the intense heat of a fire heavy walls are temporarily weakened, but if strong enough to stand, their strength returns after cooling, and they can often be used in case of rebuilding or restoring. Synchronous vibration is very dangerous to any structure, and for this reason platoons of soldiers are never allowed to march over even the strongest bridge; they must "break step" and walk with irregular trend.

It is a fact that in mills of ordinary construction a safe form for stability and for low rate of fire destructibility, is two stories high, extending over sufficient space to give the room required. It is safe to assume that equal cubic content, with double the base area, has but one-half the fire loss liability of the double altitude, with conditions otherwise equal. Add to the fire result of difference in hight the effect of the greater vibration of the higher structure, and the hazard of the higher structure is yet further augmented.

It is self-evident that a two-story mill, even if not properly built, would naturally shake less; and for several other reasons the walls are more likely to stand after fire, than in case of factories having many lofty stories. A one-story mill with cement floor—and especially if all the roof be iron—is the safest fire risk any manufactory can offer; but next to it comes the two-story mill, which, for many kinds of work, is far more convenient and easier to operate than the other, while always as much cheaper as a floor is cheaper than a roof; and in a city but half the amount of costly ground would be needed. If such a two-story mill had, at proper intervals, strong dividing brick walls extending several feet through the roof, and iron doors for communication, sliding into the wall, not only would each division wall brace the building so as to prevent vibration, but it is probable that in case of fire only one compartment, and perhaps only one story of that compartment, would be seriously injured.

A New Metallic Compound.

Dr. Granville Cole has drawn attention, in a paper recently read before the British Society of Arts, to a new metallic compound which, he states, possesses properties that are likely to make it valuable in many branches of the arts.

It was discovered some time since, by J. Berger Spence, that the sulphides of metals, combined with molten sulphur, form a liquid, which on cooling becomes a homogeneous mass of dark gray color and possessing great tenacity, while it is not affected by the atmosphere, and resists acids and alkalies well. It has a comparatively low melting point, 320°F., and expands in cooling so that it fills molds very accurately, so well indeed that the marks of a finger on a plate of glass are reproduced. Experiments are being made to test its adaptability for printing and stereotyping purposes, and casts from gelatine molds have been made without destroying them.

It has been tried by the South Metropolitan gas works for joining gas pipe, with such success as regards the tightness of the joint and the ease and rapidity with which it is applied, that it has been adopted by the engineer of that corporation. Over lead it has the advantage of being much cheaper and of doing away with caulking, while its property of being a bad conductor of heat suggests other important uses. For the specimens exhibited iron pyrites, containing lead and zinc, were used, the material obtained being capable of receiving a polish. Various colors, such as the patina of bronze, the dark blue of steel and the appearance of silver and gold, have been imparted to it; so that there is some promise of its being available for the reproduction of works of art.

SPEED OF LINE SHAFTS.—The tendency at the present time is to increase rather than to diminish the speed of line shafts. Good practice is to run shafts for machine shops at 120 revolutions per minute; for wood-working machinery, at 250; and for cotton and woolen mills, at from 300 to 400 revolutions. Hollow or pipe shafting has been made to run very satisfactorily at 600 revolutions per minute. This kind of shafting, however, is too costly to be generally introduced. These speeds are not too high for successful practice. Belts can be run safely at 500 to 600 feet per minute; but on say 6-inch pulleys, lose about two-fifths of their cohesion by centrifugal force, and are a little uncertain in driving action. Ordinary cast-iron pulleys are safe also at these speeds, if well made and not too large. A 4-foot pulley should not be run over 400 revolutions per minute, according to the experience of a good engineer; but with wooden rim, properly made, a higher speed may be run with safety. We mention speeds in connection with pulleys and belts, because these are more liable to be affected by high velocities than shafts are, the belting losing pulley contact, and the pulleys losing cohesion by reason of the centrifugal force developed by high speeds.—*Mechanic and Builder.*

RULE for finding the weight necessary to put on a shift valve lever, when the area of valve, pressure, etc., are known: Multiply the area of the valve by the pressure in pounds per square inch; multiply this product by the distance of the valve from the fulcrum; multiply the weight of the lever by one-half its length; then multiply the weight of the valve and stem by their distance from the fulcrum; add these last two products together, subtract their sum from the first product, and divide the remainder by the length of the lever; the quotient will be the *weight* required.

SCIENTIFIC PROGRESS.

Instinct the Result of Inherited Actions Unconsciously Performed.

Most naturalists, writes Mr. Charles Darwin in *Nature*, appear to believe that every instinct was at first consciously performed; but this seems to me an erroneous conclusion in many cases, though true in others. Birds, when variously excited, assume strange attitudes and ruffle their feathers; and if the erection of the feathers in some particular manner were advantageous to a male while courting the female, there does not seem to be any improbability in the offspring which inherited this action being favored, and we know that odd tricks and new gestures performed unconsciously are often inherited by man. We may take a different case, (which I believe has been already advanced by some one), that of young ground birds which squat and hide themselves when in danger, immediately after emerging from the egg; and here it seems hardly possible that the habit could have been consciously acquired just after birth without any experience. But if those young birds which remain motionless when frightened were oftener preserved from beasts of prey than those which tried to escape, the habit of squatting might have been acquired without any consciousness on the part of the young birds.

The reasoning applies with special force to some young wading and water birds, the old of which do not conceal themselves when in danger. Again, a ben partridge, when there is danger, flies a short distance from her young ones and leaves them closely squatted; she then flutters along the ground as if crippled, in the wonderful manner which is familiar to almost every one; but, differently from a really wounded bird, she makes herself conspicuous. Now, it is more than doubtful whether any bird ever existed with sufficient intellect to think that if she imitated the actions of an injured bird, she would draw away a dog or other enemy from her young ones; for this presupposes that she had observed such actions in an injured comrade and knew that they would tempt an enemy to pursuit.

Many naturalists now admit that, for instance, the hinge of a shell has been formed by the preservation and inheritance of successive useful variations, the individuals with a somewhat better constructed shell being preserved in greater numbers than those with a less well constructed one; and why should not beneficial variations in the inherited actions be preserved in like manner, without any thought or conscious intention on her part any more than on the part of the mollusk, the hinge of the shell of which has been modified and improved independently of consciousness.

CONCERNING carbon bisulphide, which has, for some time past, been gradually attaining to a state of importance in the useful arts, Prof. Mallet gave some interesting facts in his review recently, of the industrial applications of chemistry, published in the *American Chemical Journal*. After noticing that, in the ordinary practice of manufacture, a large quantity of free sulphur is covered over with the sulphide, which requires to be separated by means of subsequent refining, and recommending, to avoid this, the passage of the mixed vapors through a second and even a third retort containing glowing carbon, he gives a number of interesting facts respecting its industrial uses. At first, this compound was used in the arts almost solely by the manufacturers of rubber; but it has lately acquired considerably increased importance, as furnishing the means of dissolving out fats and oils from various materials which could not be treated with equal advantage in any other way. Thus, for example, from oil-seed cakes, from the marc of olive-oil pressing, from woolen rags and waste, from cotton waste used in wiping machinery and packing stuffing-boxes and the like, and from bones from which gelatine and phosphates are afterward to be made, large quantities are extracted. It has also come to be used to some extent in the manufacture of the sulpho-carbonates used for the destruction of the phylloxera.

ELECTROTYPING WITH IRON.—Herr Bottger describes a process for steeling copper plates by electrolysis. One hundred parts of ferrous-ammonia sulphate, together with 50 parts of sal-ammoniac, are dissolved in 500 parts of pure water, a few drops of sulphuric acid being added to acidulate the solution. The copper plate is connected to the negative pole of a battery of two or three Bunsen elements, an iron plate of equal size being employed as an anode. The solution is maintained at from 60° to 80°. The deposit of iron is of a hard, steel-like quality, and is very rapidly formed.

PHONOGRAPHIC MATRICES.—M. Lambrigot has invented a modification of Edison's phonographic matrices, by substituting stearine for the tin foil, and electrotyping the impressed surfaces. It has been suggested that these electrotypes, which can be made very cheaply, may render great service in the study of foreign languages, for they preserve indefinitely and repeat as often as may be desired words that are the most difficult to pronounce correctly. A true speaking dictionary might thus be made, an undertaking which the wildest fancy would not have dreamed of a few years ago.—*Nature.*

A New Distance Finder.

Mr. T. A. Matsdaira, C. E., a native of Japan, but now residing in New York, has recently invented several important improvements in surveying instruments. One of which is a new "distance finder," which consists of a finely graduated brass or steel plate, two feet in length. It has a slot in the center and a movable support, to which a telescope is attached, which may be firmly fixed by a thumb-screw. If, for instance, the distance of an object across a lake is sought, the instrument, which has five spirit levels to secure perfect accuracy, is placed in position, and the telescope is eighted upon the object and firmly attached to the support. It is then moved in a slot two feet to the other end of the plate, and another object is now noted through it. With this object in mind, the telescope is moved back to its first position, and turned until this second object is seen through it. The variation from the line of its first direction gives an angle of a triangle, at the other two angles of which are the two objects. By means of the first mentioned instrument the second angle and sides of the triangle are measured, and hence the distance of the first object is secured.

Another device for finding the distance of an object in a different way is also described by Mr. Matsdaira. The plate, two feet in length, has a fixed telescope at one end. At the other end, upon the arc of a circle, whose sections are four feet, another telescope moves, and has a pointer, which directs to a graduated scale at a tangent to the arc. When the two telescopes are both directed to the distant object, the pointer indicates a certain number on the scale, which is divided down to 1-32 of an inch. A table accurately prepared shows to what distance these numbers refer, and by looking on it the distance is ascertained.

CRYSTALLIZED CHLOROPHYL.—The following note by Mr. A. Gautier, on the method of obtaining pure crystallized chlorophyl, has been communicated to the Academy and was read at a late meeting of the French Photographic Society, in consequence of its having been shown by MM. Becquerel, Croe, and Ducos du Hauron, that that substance, when added to a sensitive film, enabled the latter to reproduce colors hitherto considered out of the reach of photography: "To obtain the chlorophyl I take the green leaves of spinach, cress, etc., and pound them in a mortar, adding to the pulp a little carbonate of soda until the liquid is neutralized, and then I submit the whole to strong pressure. The mass thus obtained I digest in alcohol of 55° C., and I again pass it through the press; then I digest it once more in alcohol of 83° C. By this process the chlorophyl is dissolved, along with all the fats, the wax and the coloring matters. To separate those, the liquid is filtered, and then placed in contact with powdered animal charcoal previously well washed and raised to a high temperature. At the end of four or five days the liquid will be found to have turned a greenish or brownish yellow, and it will contain all the impurities. It is decanted off, and the charcoal is collected in a tube plugged with cotton wool, where it is washed with alcohol at 65° C. This liquid takes up the yellow crystallizable substance which is always found to accompany chlorophyl, and which seems to have some intimate relation with it. On the charcoal thus deprived of the yellow substance, or containing mere traces of it, there is found anhydrous ether, or better still, light petroleum oil, which does not dissolve the yellow substance. These solvents take up the chlorophyl and yield a deep green liquid, from which the latter can be crystallized out by slow evaporation in the dark."

METEORIC IRON IN SNOW.—Observations of snow collected on mountain tops, and within the Arctic circle, far beyond the influence of factories and smoke, confirm the supposition that minute particles of iron float in the atmosphere, and in time fall to the earth. By some men of science these floating particles of iron are believed to bear some relation to the phenomena of the aurora. Gronemann, of Gottingen, for instance, holds that streams of the particles revolve around the sun, and that, when passing the earth, they are attracted to the poles, thence stretching forth as long filaments into space; but, as they travel with planetary velocity, they become ignited in the earth's atmosphere, and in this way produce the well-known luminous appearance characterizing auroral phenomena. Prof. Nordenskjold, who examined snow in the far north, beyond Spitzbergen, says that he found in it exceedingly minute particles of metallic iron, phosphorus and cobalt.

A NEW USE FOR THE TELEPHONE.—The telephone has been found by Herr Niemoller capable of determining very quickly and accurately the resistance of liquids. It is substituted for the galvanometer in a galvanic bridge, and an induction current is used; then, if the resistances compared are a large liquid resistance on the one hand, and a Siemens resistance box on the other, so that the electro-dynamic constants of the branches are very small; if, further, a German silver or platinum wire be used as measuring wire, it is found that in the position where the galvanometer shows no deflection, the tone in the telephone has a well-marked minimum of intensity. Supposing the liquid resistance has 2,000 units, a variation of it, even 4 units, reveals itself in a displacement of the minimum position.

undoubtedly does, answer the purposes of speculators to have this condition continued; but it does not aid in the development of the mining properties, nor in the advancement of the mining interests. It in reality has a diametrically opposite effect, and produces in the stock hoards the dullness and inertia that are now and have been so long prominent. Every day there is some little flurry, a mere ripple upon the surface of the stock pool, but ere the closing of the day's operations a lethargetic stagnation supervenes which no efforts can overcome.

Rumors and reports of bonanza discoveries and rich strikes are sent down from the mines, which, had they reached

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

ITEMS.—*Ledger*, Mar. 27: George Thomas, of Jackson Gate, has taken a contract to sink 100 ft on the Doty claim, in Hunt's gulch. Work is in progress on the contract. Jos Simsich has contracted to sink the new shaft on the Zelle mine an additional 200 ft. He has commenced the contract. D. McKay and John Eagan bonded a mining claim near the Moore mine to McLaughlin, who has started to open it up. Owen Kelly has bonded a quartz claim in Hunt's gulch for $12,000.

YELLOW JACKET.—The shaft is down 90 ft, with good ore on the bottom. Water is somewhat troublesome. The company has secured the Bonanza mill, but are unable to crush as yet, there being no water supply. Negotiations are progressing for the purchase of the pipe carrying water from the Crown Point mill, and if successful it will soon get to its work of testing the gold-bearing qualities of the quartz.

CALAVERAS.

BOSTON.—*Advertiser*, Mar. 25: Work is progressing rapidly, and in a short time the necessary machinery will be placed in position, which consists of an 80-stamp mill and 8 furnaces, by which the precious metal will be extracted. This lode is 30 ft in width; the ore is rich, bearing gold and silver.

CALAVERAS MINES.—*Chronicle*, Mar. 27: At the Eureka diggings is still the order of the day, it being impossible to pipe the bottom until water can be brought in through the Rich Gulch ditch. As the Rich Gulch conduit is dependent upon Clark's canal for water and the latter is still frozen up at the head, there is no knowing when a supply of the aqueous can be had from that quarter. Veith, of the Mammoth, has not yet finished cleaning up. It will be several figures to express the amount yielded when concludes. At the Penobscot, Emerson & Co. proprietors, piping is steadily indulged in, and at the same time a hand-power derrick is being erected. When completed a derrick will facilitate the removal of boulders and other obstructions. The Penobscot is blossoming out into a full-fledged hydraulic. At the Duryea piping has been resumed after a temporary suspension to permit of changing the direction of the discharge from the mine.

TUOLUMNE.

HOPLAND ITEM.—Ukiah *Press*: The gold is found in the same kind of location as at Capella—a detached ridge about a mile long. With flat sluices and a small head of water, 5 men cleaned up $4 per day each, or $20 for the whole per diem, for several days' run. One man cooked and tended water, 1 tended sluices and 3 picked and shoveled dirt into the sluices. Gold is found in places all the way to the Gualala. The boulders are all worn and water-washed, and at some far distant date a great river must have brought the gold down from the north.

SONORA.

BELVIDERE.—*Free Press*, Mar. 23: From top of upraise to south drift is in 85 ft, being 138 ft south of main shaft. The north drift on the 350 level is in 42 ft from the shaft, the face showing some 2 or 3 ft of ore of excellent quality. At the 300 level the new north drift is in 41 ft from the shaft. Some good ore is already making its appearance.

STANDARD CON.—The east crosscut, 500 level, is in from the shaft 200 ft. East crosscut from the south drift, 385 level, to connect with the north drift on the West Standard vein, is in 22 ft. Upraise No. 2 from this south drift is up 92 ft, showing a ledge 6 ft wide, of very rich ore. Upraise from the north drift is up 105 ft, with a vein in the top 4½ ft wide, of good milling ore. North drift on the 400 level, 300 level, incline, is in 221 ft; the ledge is 3 ft wide, of good ore. South drift from the west crosscut is in 241 ft; the ledge is 2½ ft wide. North drift, 550 level, is in 120 ft; the ledge in the face is 4 ft, of good milling ore.

JUPITER.—The 500 level, west crosscut from the main south drift, is in 173 ft. The west crosscut from south drift No. 2 is in 104 ft.

WOODSHAW.—The winze on vein No. 2, 450 level, is now down 135 ft. There are 4 ft of ledge matter and 2 ft of solid rock now in the bottom. The ledge improves in strength and quality as depth is attained. A circumstance of peculiar significance on the 450 level and in the winze is that veins Nos. 2 and 3 are only 10 ft apart, and are gradually coming together, and every indication the winze goes to show that these two ledges must come in contact and unite very soon.

BOSTON CON.—The main incline shaft has reached a depth of 64 ft below the 200 level. The north drift, 200 level, has been extended 14 ft during the week. The face of this drift is now in a large vein, mostly quartz, with improved appearance.

SOUTH NOONDAY.—Drifts north and south are now being run on the Cummins ledge, which was cut in the east crosscut on the 150 level. The north drift is in 40 ft, showing a well-defined ledge of good ore. In the face the ledge takes up the entire width of the drift, and the ore is of a better quality than any yet encountered. The south drift is in 28 ft, and the ore is of good milling quality. As the drifts are advanced, 4 tons of ore are raised daily and piled on the dump. There are 60 tons ready for shipment after milling purposes.

HOMER.—The tunnel is in 170 ft. A branch drift has been started on the Seneca vein, 154 ft from the mouth of the tunnel, running southwest toward the Nioma vein, and the face in the vein is fully 3 ft in thickness, of high-grade ore.

BODIE TUNNEL.—During the past week a ledge of good milling ore has been cut, 4 ft wide. The winze at the 60-ft station is down 18 ft, showing a strong, well-defined ledge, assaye averaging $30 in gold.

BELWER CON.—The north drift on the Ralston vein is in 25 ft; the ledge in the face is 3 ft wide. The south drift in from the tunnel 110 ft. The ledge is 2 ft wide, and looking well. The Stonewall ledge is 2 ft wide, of rich ore, and in the stopes on the Ralston vein the ledge is 4 ft wide, of good milling ore.

STANDARD.—The north drift, 530 level, is in 102 ft. The ledge is 2½ ft wide. The south drift is in 179 ft; the ledge is 3 ft wide. The upraise to connect with the east crosscut from the 450 level of the Standard mine is up 76 ft; the ledge is 3 ft wide.

DOUBLE STANDARD.—The north drift is in 20 ft. The ledge in the face is 3½ ft wide, of good ore. The winze is down 13 ft; the ledge in the bottom is 8 ft wide, and looks well.

TIOGA.—*Chronicle*, Mar. 2: Since last report the station at the 800 level has been completed, receiving tank put in place and shaft sunk and timbered 14 ft below station. Crosscutting from the 800 level, both east and west, was commenced. The east crosscut now in 9 ft, and the west 3 ft.

UNIVERSITY.—*News*, Mar. 20: The shaft is down 450 ft. During the past week an entire change of formation has come in, being of a gray porphyry with seams of bright, lively quartz, giving fair assays, continually coming in.

KING BEE.—The shaft is down 132 ft. The ground continues of the most favorable character.

NEVADA.

A NEW QUARTZ FIELD.—*Transcript*, Mar. 21: The recent quartz discoveries 5 miles north of this city, are regarded as among the richest and most important ever made in this part of the State. On the 15th of last January, W. W. Kirkham and Wm. Hitchcock located a claim a quarter of a mile from the Mt. Vernon house, where they had discovered some fair looking croppings, and now have an incline down 50 ft. In the top is a ledge of 20 inches that will pay $200 per ton, while numerous bunches found in it yield $5 a pound. The ledge in the bottom of the incline is 4 inches thick and pays from $7 to $10 a pound. The ore is all decomposed, but the walls are well defined. An arastra is run on the low-grade ore, while the picked is pounded in a hand mortar. In four days by these rude means the owners have taken out $1,500. The ledges increase in size and richness with depth. They have another ledge one-quarter of a mile southeast of the above on which they have sunk 40 ft. It is from 6 to 8 inches thick, and pays $80 per ton.

GREEN MOUNTAIN.—This mine is situated a quarter of a mile above the Murchie, near Deer creek. The surface has been worked by tunnels. A 30-ft shaft was sunk from one tunnel when the water drove the miners out. They left a 2½-ft ledge in the bottom that was paying $24 a ton. The claim has produced $7,000 or $8,000. The ore near the surface paid $17 to $24.

J. C. MURCHIE, ET AL., GRAVEL.—This property, situated 2½ miles from this city, on the Dutch Flat road, consists of 100 acres patented ground on the blue gravel lead, and 80 acres more unpatented. There are three ditches, three reservoirs, pipe, etc. The main bank has a hight of 60 ft and is 800 ft in width. There is a strata of blue gravel from the bedrock up, about 20 ft, which prospects splendidly. The claim has paid from $100 to $300 per day to the man with shovels, in early days. There are the extensions of several rich quartz lodes running through this property. There is a tunnel run on the "Never-give-it-up" quartz lode, 500 ft. The quartz has paid $8 per ton. An upraise has been made from the back end of this tunnel, tapping the blue gravel near the rimrock, which prospects splendid in fine gold.

NORTH STAR.—The ledge varies from 18 to 36 inches in thickness, is sulphureted, and paye an average of $14 per ton.

EUREKA.—This mine was partially worked to water level several years ago by Prof. Muller and others, the ore paying about $100 a ton, the ledge averaging 12 inches. The present tunnel is in 250 ft and will reach the chute within 100 ft more.

MYERS RAVINE.—One party has taken out $3,000 from a ledge he found there a short time ago, and two of the oldest gravel miners in the county are about to quit their present claims and begin work on a ledge in the same locality.

GENTLE ANNIE.—There are two tunnels and an incline, the last named running along a 5-ft ledge of good ore, and also developing a gravel deposit that prospects well.

SNEATH & CLAY.—This claim is located on Gold flat. The first crushing in 1862 paid $32 a ton. The second crushing a few months after yielded $80. Some of the ore paid $186 per ton. Hoisting works and mill were erected. When the mill was completed in 1863, there were from 800 to 1,000 tons of ore on the dump, which averaged $70 a ton. The incline was down 150 ft, with several drifts, and the bonanza chute was lost. The mine yielded over $200,000, over one-half profit, and was sold to parties who worked it for two years profitably, the rock varying from $20 to $50 to the ton. After several years work and taking out over $200,000 more, the mine was shut down.

BULLION.—This mine is situated on Wolf creek, 2½ miles south of the city. A north and south ledge, two ft thick and uniform, shows in the tunnel for a distance of 150 ft. Assays prove the ore to contain from $20 to $40 per ton in gold and silver.

COLUMBIA.—This property is located on Gold flat, about a mile south of the city. Prof. Muller worked a 10-inch ledge on this claim in 1858, and realized $20 a ton from the ore, which is rich in sulphurets.

EAST ORLEANS.—The tunnel is 727 ft long, 400 ft being between the walls. The formation is from 4 to 8 ft thick, the ore yielding from $11 to $15.50 per ton. It has been worked to water level. The present owners in running the tunnel have cut through the apex of two pay chutes, which they originally started to tap, being yet 80 ft ahead of the face of the tunnel.

YELLOW DIAMOND.—A strong ledge lying between slate and granite has been worked by two tunnels for a depth of 50 ft. The ledge carries 4% of sulphurets, mixed samples of which assayed $3,600 a ton. They have run a tunnel 100 ft and cut the ledge 75 ft below the surface, and are drifting and obtaining some very rich ore.

ILLINOIS.—The Illinois claim consists of 2,000 linear ft on the ledge. Two shafts were sunk, one 50 and the other 30 ft. The ledge was struck in both shafts and showed an average width of 2 ft.

BUCKEYE.—The ledge is a contact, from 4 to 6 ft thick. The incline is down 220 ft, and the tunnel 300 ft in length. The ore produced from $12 to $24 per ton.

ROUND MOUNTAIN.—This mine is located 4 miles north of the city and comprises 160 acres. From the west side of the claim extends a 700-ft tunnel with 800 ft of drifts. The channel averages 6 to 8 ft in hight and 100 ft across, and runs clear through the property. The gravel pays from $2 to $3 a car.

CALEDONIA CON.—Embraces the Holmes, Baker & Ashburn and other properties, including 4½ miles of ditch, reservoirs and piping. It is on the same north and south range of gravel as Blue Tent, Quaker Hill and Little York, while it has the very great advantage of being also intersected by the channel which runs east and west.

BUCLOW CON.—The shaft is down 200 ft. There is a tunnel running along the ledge which is 5 ft thick. This tunnel when completed will give 500 ft of backs. The croppings of this claim paid 0.25 a ton; below 20 ft, $18.93; below 175 ft, over $50.

PLACER.

QUARTZ ITEMS.—*Herald*, Mar. 27: Stuart, Thatcher & Low sold last week the Umatilla and Red Cloud, of 1,000 ft each, to a New York company for $2,000. They are 3 miles from Auburn. One shaft is down 52 ft; the ledge is 3½ ft thick, and the ore is worth $25 per ton. The 5-stamp mill, located on one of the claims sold, is retained by the original owners.

SAN BERNARDINO.

IVANPAH CON.—*Times*, Mar. 20: From Mr. J. B. Cook we learn that there is a large force of men at work on their mines. The mill has commenced running. Mr. Cook showed us a specimen of the ore, which is among the finest we ever saw from the district. Forty tons are on the dumps and at the mill. The mill is one of the finest in the State, and there will be a large shipment of bullion about April 1st.

ULEY.—Is turning out better ore than ever, having struck very rich ore. The mine shows that the more work that is done the more ore of a high grade can be obtained.

BULLION.—Struck it very rich, and has now shown its permanency and will become one of the regular paying mines of the district.

CAMBRIA.—This mine is situated 0 milee south from Ivanpah, and is turning out considerable quantitiee of ore of a good paying quality, and will add another permanent mine to the district.

GOLD MINES.—The discovery of gold in this camp was a surprise to a great many. Mr. Cook informs us that Mr. L. M. Wilson, who accompanies him, has some very fine ledges, the gold showing in quantities. Mr. Wilson has had some tons of ore crushed and is about putting up some arastras to amalgamate. The pulp shows that the rock goes from $40 to $100 per ton. Mr. A. McFarland has also a fine ledge of gold rock in the same vicinity, which will no doubt turn out equally well. Altogether, Ivanpah has never had a brighter future.

SHASTA.

GREAT EASTERN.—*Independent*, Mar. 25: The ledge is 4 ft in width and assays, by the mortar, from $10 to $60 per ton, taken from all parts of the ledge. It continues a distance of upwards of 400 ft. A shaft has been sunk 40 ft, which shows an improvement in the richness of the ore every foot of the way.

TUOLUMNE.

RAWHIDE.—*Independent*, March 27: The shaft is down 320 ft, at which depth the vein is 25 ft thick. There is a 20 stamp mill, on the most improved plan of any mill ever before built in the county, and together with machinery for hoisting and pumping. It is not being worked. The ore is of a fair milling quality.

CHAPARRAL.—A level has been driven in on the vein 75 ft, and shaft sunk from the level 90 ft, which makes the entire depth 120 ft. A shaft is being sunk on the hillside to connect with the works below which will serve to ventilate the mine, also as a working shaft. There is a 6-ft vein on the bottom of the shaft with a 4-inch gouge of black clay. The entire width of this vein shows free gold; the sulphurets carry a large percentage.

CONFIDENCE.—In the 1000 level plenty of ore stands ready to be taken out. In the raise, filled with loose quartz, men are at work on a 3-ft vein that shows gold freely. The whole mine is pierced with large veins running in every direction, much of it low grade ore. There are 500 tons of ore that will pay from $15 to $20 per ton in the mill.

NEVADA.

WASHOE DISTRICT.

SIERRA NEVADA.—Gold Hill *News*, Mar. 31: On the 2300 level, and from a point 600 ft north of the east shaft, a crosscut has been started west. This will be pushed till the west wall of the vein is found, when the angle of its dip will be ascertained and a raise made to the main shaft of the mine. Opposite this west crosscut another has been started east to prospect the ore vein lying in that direction. The winze from the 2400 level and 145 ft north of the incline, is in good ore, the bottom 88 ft below that level. Above the 2300 level, and back of the incline, stopes have been opened, which are yielding 25 tons per day of good milling ore.

ORIDE.—Winze No. 2 from the 2100 level is 32 ft below that level and continues in good milling ore. The raise from the south drift on the Hardy vein, on the 2200 level, has connected with the winze, and the connection has improved ventilation. The north drift, 2200 level, is in vein porphyry and 225 ft from the main southeast drift. The joint Mexican crosscut east on the 2300 level continues in favorable-looking vein material carrying low-grade quartz; total length, 250 ft. Crosscut No. 1 from the Hardy vein east is in 110 ft from the north drift, and is getting some fair-grade ore. The main north drift on the 2500 level is in a heavy vein formation carrying low-grade quartz; total distance from incline, 314 ft. The east drift on this level is in from the incline 250 ft.

BELCHER.—A diamond drill has been run in crosscut No. 2 east on the 3000 level, and has tapped the water, which is being allowed to drain off. This water is the hottest yet encountered on the Comstock, being 170° Fahr.

LEVIATHAN.—The 750 level is in 100 ft. The face is still in vein matter of a very promising character, streaks of which give assays of $10 or $15 per ton. The north crosscut is in 38 ft.

CROWN POINT.—The winze from the 2700 level has reached a depth of 278 ft on the slope below that level. In the crosscut east on the Belcher line a diamond drill was run in about 100 ft, and encountered rock giving assays of $5.

YELLOW JACKET.—Sinking in the shaft has been resumed, a diamond drill having been sent ahead and not enough water having been encountered to hinder operations. Total depth of shaft, 2,870 ft—the deepest perpendicular workings on the lode. West crosscut, 2700 level, is in 250 ft.

CALIFORNIA.—The crosscut west, 1,500 level, is in 105 ft. The raise for the north ore vein is in low-grade quartz 35 ft above the 2100 level.

CON. VIRGINIA.—The joint California east crosscut, on the 2200 level is now 214 ft in length and in a fine vein formation carrying streaks of clay and quartz. Daily ore yield, 150 tons.

CON. IMPERIAL.—The north drift on the 2800 level is in hard porphyry; total length, 260 ft. The joint Alpha winze from the 2000 level has a depth of 280 ft on the slope and is near the 2800 level. It is in quartz and porphyry.

GOULD & CURRY.—The G. & C. and B. & B. shaft has attained a depth of 994 ft. The raise from the 1700 level to meet this shaft is up 310 ft, leaving 116 ft yet to be made to connect the two.

SAVAGE.—The main incline is down on the slope below the 2200 station 250 ft. The drift for this incline from the 2400 station of the C. N. S. shaft is in 535 ft.

MEXICAN.—The crosscut east on the 2300 level, joint with Union Con., is 270 ft in length, and has 35 ft yet to run to reach the point from which the joint winze will be sunk to the 2500 level.

BELMONT DISTRICT.

BARCELONA.—*Courier*, Mar. 20: Four or five tons of high-grade ore have been extracted from the new strike in the old works, which improves in width and richness. We average 1 ton per day of first-class ore, which assays $380.15 per ton; also 4 tons of second-class ore which assays $94.25; besides which we have 1,000 tons of low-grade ore on the dump which assays from $31.42 to $62.33 per ton. We have started up the compressors and cleared the Joint tunnel of foul air, and have cut through veins which assay well.

SAN ANTONIO.—Have opened a station in the ledge at the junction of the crosscut, and run the main 450 level south 12 ft along the hanging wall. Are running this level a short distance north to put up a raise to the 350 level to give an air course, as well as an escape in case of any accident in the main incline. The ledge averages 8 ft in thickness, and the assays run over $15 per ton. It improves as it goes south towards the ore chimney.

JETT CON.—In the last 6 days have sunk the Centennial shaft 10 ft, making the total depth 90 ft. The Idlewild tunnel level is in 116 ft.

BRISTOL DISTRICT.

ITEMS.—Piocho *Record*, Mar. 27: The mining outlook of Bristol district never looked so bright as it does at present. Two companies are now operating there—the Hillside mill and mining company, of San Francisco, and the Bristol silver mining company, of Minneapolis, Minn., who have taken hold of several properties in the district, including the Cave and Mayflower, and have purchased hoisting works; are putting up a 10-stamp mill and have an improved arteeian well apparatus, capable of sinking to a depth of 3,000 ft, and intend boring for flowing water in a few days. They have machinery and sections for a water-jacket furnace. The Hillside is the oldest company and have been operating in Bristol for 2 years. They have recently made several improvements, putting up new hoisting works on the mine, building a refinery and have torn down their stone smelter, and have in process of erection a 55-ton water-jacket furnace. A great deal of work has been done on their mines, the Hilleide and the Mondha.

EUREKA DISTRICT.

DUNGERBERG.—*Sentinel*, Mar. 25: We made mention some time ago that a bonanza had been found in this property. It has been worked ever since with gratifying results. The top, bottom and sides of the drift are still in good ore. The ore was found on the 400 level, and prospecting is now being done on the 3d and 5th levels to find the extent of the ore body. From 15 to 18 tons are daily extracted and sent to the Richmond works for reduction.

RUBY CON.—The crosscut toward the Home Ticket has been advanced during the week 20 ft. The ground is more favorable for progress. Good ore continues to be extracted from the sinking in the Home Ticket. The returns of ore now being made are all the result of exploring, and are going far towards meeting the costs of the mine.

RICHMOND.—No. 11 chamber is looking very well in the southwestern end, and promisee to yield a large quantity of ore. The No. 12 chamber is not looking so well as it was. No. 10 is looking better. No. 15 chamber is looking well, and has improved since last report.

HOOSAC.—The west drift on the 200 level is in 720 ft, in very favorable ledge matter. During the last 370 ft, the drift has been run through a mixture of decomposed quartz, porphyry, solidified lime and clay, with occasional bunches of black quartz, indicating a close proximity to a body of ore. In the years 1873 and 1874 this mine produced over $700,000.

EUREKA CON.—The following work has been done in the several different levels: 2d—North drift continued 22 ft, now in 113 ft; 3d—Winze sunk 22 ft, now down 32 ft; 7th—North drift continued 17 ft, now in 221 ft; northeast drift continued 14 ft; now in 233 ft; 8th—Southeast drift continued 35 ft; now in 200 ft; 9th—South drift continued 51 ft, now in 68 ft; west drift continued 11 ft, now in 48 ft; upraise continued 17 ft, now up 17 ft; 10—East drift continued 42 ft, now in 233 ft; 11th—North drift continued 17 ft, now in 154 ft.

ESMERALDA DISTRICT.

THANKSGIVING.—*Herald*, Mar. 27: This mine is located on Last Chance hill. Assays have been made which show up in the hundreds, though we put the average of the whole 54 ft at $100. It shows a ledge of white quartz on the surface 13 ft thick, with ore running as high as $187 per ton. At the depth of 100 ft a ledge 54 ft has been run through, there not being 1 foot in the whole space that will not pay for crushing. The first 20 inches of the ledge will assay over $100. After passing through this seam, about 6 or 8 ft of clay and porphyry is encountered, then another seam of clay about 3 ft thick, carrying rock that will horn out from 75 to 100 colors of gold to 1 ounce of rock. There is some other rock among this clay in which the gold is coarser, but it is not as rich as that carrying the finest gold. Adjoining this seam of clay is 10 ft of solid white quartz, which will horn out a great many colors to an ounce of rock. The whole 10 ft will mill $30 or $40 per ton. Next is about 1 foot of porphyry and clay, then 10 ft of black and rose-colored quartz, the black carrying iron and silver, the rose-color gold. Next is a few ft of white quartz, clay and porphyry, then 10 ft of black and rose-colored quartz, carrying more gold and silver than the first 10 ft of the same kind passed through.

MOUNT ROSE DISTRICT.

PARADISE AND BULLION.—*Reporter*, Mar. 27: These 2 mines have been for more than a year advantageously worked, at a depth of 500 ft from the surface, by a tunnel extending 600 ft into the hill, and continually showing rich ore. The profitable working of both the above-mentioned mines, coupled with the recent discovery of a strong ledge, also rich in mineral, immediately north of the Bullion line (said discovery being known as the North Bullion), and the strike of a large body of rich ore in the Mayflower claim, is "confirmation strong" of the existence of untold wealth yet undiscovered. The Paradise mill commenced running exclusively by water power on the 26th, and everything works satisfactorily.

ITEMS.—The Mount Rose, conducted under the same management as the Paradise, daily gives evidence of its wealth and permanency. A shaft will shortly be sunk on the Mary Wilder to ascertain the quantity of mineral in that claim, the Salt Lake returns having settled the question of its quality.

ARIZONA.

TOMBSTONE ITEMS.—*Nugget*, Mar. 25: On the 22d the Contention mill made their first shipment of 5 bars of bullion, varying from 900 to 940 fine, and worth from $2,500 to $3,000 per bar. On the 23d they made a second of 5 bars more, worth about the same as the first. On and after this date they will ship 10 bars per day. The Corbin mill will erect 5 more stamps, making in all 20 stampe, the same number that the Contention mill runs; and with the Gird mill's 10 stamps, and the Corbin's 20, all pounding on Tough Nut ore, we may expect to see from $60,000 to $75,000 per week leaving Tombstone district, and with the Contention bullion, we may safely count on shipping $100,000 per week.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department No. 10, San Francisco:

WINDSOR M. CO.—Mar. 23d. Location: Columbus, Nevada. Capital, $10,000,000. Directors—T. L. Stanley, O. W. Randolph, Horace Webster, John Spruance and W. E. Norwood.

STEPHENS CONCENTRATOR CO.—Mar. 24th. Object: To manufacture and sell the Stephens dry ore concentrator. Capital, $100,000. Directors—W. S. Rosecrans, E. W. Stephens, C. M. Seeley, Charles E. Travers, R. C. Ames, S. E. Olmstod and W. N. Stevens.

RED JACKET G. & S. M. CO.—Mar. 24th. Capital, $1,000,000. Directors—J. M. Tosh, P. G. Vibbard, C. H. Wakelee, G. W. Spencer and S. C. Curtis.

DWELLE M. CO.—Mar. 21st. Location: Esmeralda county, Nevada. Capital, $10,000,000. Directors—R. N. Graves, A. Hayward, W. H. Sheridan, William Kohl and J. Epstein.

CASTLE DOME SMELTING & M. CO.—Location: Arizona. Capital, $1,000,000. Trustees—John M. Wells, Henry K. Southwick, John W. King, William Bond, James C. Hayes, Geo. A. Miner and Andrew H. Carghill.

CISCO G. M. CO.—Mar. 23d. Location: Placer county, Cal. Capital, $5,000,000. Directors—P. S. Van Rensselaer, E. M. Walkor, W. L. Oliver, Charles G. Fink and Charles Kaufman.

WAGE M. CO.—Mar. 23d. Location: Fresno county, Cal. Capital, $5,000,000. Directors—C. D. Keeney, U. T. Smith, Oliver Merrill, H. T. Fairbanks and W. F. Myers.

HARD MONEY CON. M. CO.—Mar. 23d. Location: Columbus, Esmeralda county, Nevada. Capital, $10,000,000. Directors—C. L. Weller, Gustave Frank, R. J. Trumbull, A. H. Lissak, Jr. and Michael Castle.

Meetings and Elections.

DANBY M. CO.—Mar. 22d. Directors—L. N. Jacobs, J. H. Tingman, B. Rich, M. W. Fox and A. D. Carvill.

JACKSON M. CO.—Mar. 23d. Directors—A. K. P. Harmon, W. E. Dean, J. Clark, C. N. Felton and George L. Ives.

EQUITABLE TUNNEL & M. CO.—Mar. 22d. Directors—D. A. Hiller, E. S. Farnsworth, Charles J. Collins, E. A. Learned, James Battersby, John Howes and F. A. Webb.

TONITE POWER CO.—Mar. 24th. Preeldent, Hamilton Smith, Jr.; Vice-Preeident, J. Baum; Secretary, R. L. Shainwald; Treasurer, Lazard Freres.

Bullion Shipments.*

Since our last issue, we have noticed the following bullion shipments:

Barbee & Walker, Mar. 22, $3,167.21; Mar. 25, $4,149.05; McCormick & Co., received, Mar. 22, $11,450; Mar. 23, $7,050; Mar. 24, $14,150; Mar. 25, $4,350; Mar. 26, $4,350; Wells, Fargo & Co., at Eureka, Mar. 23, $4,055.24; Mar. 25, $1,000; Richmond, Mar. 23, $14,209.64; Mar. 27, $24,647.62; Ontario, Mar. 23, $16,528.73; Christy, Mar. 23, $2,310.32; Mar. 25, $1,647.48; Horn Silver, in bullion, 22,373 lbs.; Mar. 27, 12 car-loads, value, $26,004.55; Northern Belle, Mar. 24, $9,016.37; Con. Virginia, Mar. 27, $28,259.20; California, Mar. 27, $28,411.80; Paradise Valley, Mar. 23, $4,194.16; Ophir, Mar. 27, $18,612.40; Tombstone, Mar. 30, $20,000; Bodie Con. Mar. 29, $6,424.

*Desiring to make our list of Bullion Shipments as complete as possible, we will be thankful to receive from mining Superintendente and Secretaries notice of all bullion shipments from their respective mines.

A DISPATCH from Cohoes, New York, says the strike in Harmony mills has become general, and 5,000 workmen are in the streets. The excitement is great. Five hundred looms are in operation.

Shellac and Lac-dye.

[By Hon. B. B. Redding.]

Mr. J. M. Stillman, of the University of California, has recently made an analysis of a resinous substance found on the creosote plant or greasewood of the deserts of Arizona. The plant is known to botanists as *Larrea Mexicana*. He read a paper on the subject before the Academy of Sciences, Feb. 2, 1880, the full text of which can be found in the *Science Record*, for February. His analysis shows the substance to contain the shellac and lac-dye of commerce, in the proportions of 61.07% of shellac and 3% of lac-dye.

Nearly all of these substances used in manufactures and in the arts are obtained from India. In that country the seed lac is found on five different plants. Insects known as *Coccus lacca* and *Coccus ficus* puncture the wood of the growth of a previous year, and deposit their eggs; the resinous matter which exudes from the wound is in some unknown manner changed by the insect, and formed into a cellular structure so as to inclose the eggs. At the same time the insect secretes and deposits a red fluid within the cellular structure, which upon evaporation is changed to a fine red powder. This is supposed to be the food of the young insects after emerging from the egg. When this work is completed the insect builds up the mass into a half globe, from the size of a half pea down to that of a pin's head, which is invariably surmounted by a small teat or nipple of the same substance. Sometimes the twigs of the plants are punctured year after year, and become so coated with lac as to be killed. Twigs thus covered are known in commerce as stick lac. The small nests, if they may be so called, when rubbed off are known as seed lac. When the twigs containing the nests are thrown into hot water, the lac is melted and floats upon the surface. It is then skimmed off and poured into narrow cotton bags, which are worked and twisted while the lac is still hot, until the lac is pressed through the interstices of the cloth upon a piece of smooth board. This is then spread by the hand into thin flakes which soon harden. It is then known as the shellac of commerce. The twigs are taken from the boiling water, which is frequently skimmed to remove dirt, leaves, etc. The water is now boiled away or allowed to evaporate, and the residue is the lac-dye of the dyer.

In Wheeler's Report, Vol. 5, of Botany, he states that Dr. Loew of his staff made an examination of the reddish brown exudate taken from the branches of the *Larrea Mexicana*, and found that it yielded a red coloring matter showing all the reactions of cochineal.

In 1867 the United States imported 784,000 lbs. of shellac. Of crude seed and stick lac there were imported into the United States in 1874, 67,536 lbs.; in 1875, 127,779 lbs.; in 1876, 10,837 lbs., the total value of which at the Custom House was $58,735, or about 28½ cents per pound. Of lac dye there was imported in 1874, 66,520 lbs.; in 1875, 42,920 lbs., and in 1876, 165,677 lbs., the Custom House value of which was $28,436, or about 10 cents per pound. This latter valuation must be an error, for the *Druggists' Circular* gives the wholesale price in New York of shellac at from 25 cents to 30 cents per pound, and lac dye at from 30 cents to 35 cents per pound.

From Mr. Stillman's analysis it is found that California and Arizona have also plants and a coccus that produce both the shellac and lac-dye, and that they are identical with the same substances imported from India.

The *Larrea Mexicana* or creosote plant is described by the botanists "as a shrub from 3 to 10 feet high, the branchlets short and very numerous; leaflets, a single pair, connate at base, two to four-tenths of an inch long, elliptic, oblong or ovate, often curved or falcate, puberulent; flowers nine-tenths of an inch in diameter, the rounded sepals silky pubescent; scale somewhat lacerate-toothed, a little shorter than the filaments."

Clarence King says it is found on all the deserts from southern California to western Texas, and from southern Utah to northern Mexico. Licut. Wheeler, in his report of "surveys west of the 100th meridian," states "that some plants depend, as the main condition of their existence, upon very dry climates is proved by the *Larrea Mexicana*, a plant that grows in considerable numbers in many parts of the Mohave desert, but not a single specimen in the coast counties;" "indeed," he adds, "standing in San Gorgonio pass, that forms a point of separation between the desert and the coast region, you may see many specimens of the plant in looking towards the east, but not a single one between this point and the coast to the westward." In the desert traversed by the Southern Pacific railroad, between San Bernardino mountains and Yuma, he found its range to extend from "about sea level up to 4,400 feet, and to be so widely spread that it may be assumed that the botanical boundaries of the desert are defined by the range of *Larrea Mexicana*." Its power to exist and thrive in deserts where the annual average rainfall does not equal four inches, he ascribes to the fact that "it is so charged with resinous matters as to make the evaporation of small particles of water quite impossible."

Mr. William Hood, Chief Assistant Engineer of the Southern Pacific railroad, in writing to me from Tucson relative to this plant, says that "probably one-half to three-quarters of all the land of Arizona west of the San Pedro river, which is not bottom land, is covered with the growth of *Larrea Mexicana*." He adds that "upon an examination of the plants he found the product of lac much larger than he expected."

The Indians of Arizona and southern California made great use of the lac obtained from this plant. With it they cemented their broken pottery and steatite bowls. They also used it to make water tight their woven grass and root baskets. Its northern limit in California appears to be Kern county, where a few specimens were found by Lieut. Wheeler. It is found abundantly in the Mohave desert.

Mr. Stillman stated, at the last meeting of the Academy of Sciences, that he had also found the lac on another plant, the *Acacia Gregii*, sent to him from Arizona.

I have procured several specimens of the creosote plant (*Larrea*) from the Mohave and Colorado deserts, and in every sample I have found evidences of the presence of the coccus. In some instances the small branches were so completely covered with lac as to prevent their further growth. Some twigs of the Larrea forwarded to me from Stanwix station, 80 miles east from Fort Yuma, are so covered with lac that this substance will weigh half as much as the dried twig to which it is attached. I send you some twigs, gathered in the Colorado and Mohave deserts, showing branches with leaves attached; also some twigs from the same bush so entirely covered with lac that it has stopped the growth of the branch.

Since the publication of Mr. Stillman's paper, an examination has been made at the various stations in Arizona between Yuma and Maricopa Wells by Mr. E. F. Gerald, traveling auditor of the Southern Pacific Railroad Company. He reports finding the plant in abundance, and everywhere covered with lac in quantities sufficient, in his opinion, to pay for gathering. At Texas Hill, a station 62 miles east of Yuma, the insects were so numerous that a large number of the plants had been killed by the complete coating of lac with which they had surrounded the branches. An examination is being made as to the presence of the insect and abundance of lac near stations in the Mohave desert. When reports are received they will be published.

There is no question as to the vast areas over which the plant grows, and that it is so abundant as to make it the prevailing characteristic flora. Possibly there may be climatic or other conditions which favor the increase of the insect in certain places on the desert and not in others. Further exploration may show that while the plant is widespread, the coccus is only local, and that consequently the shellac and dye can be obtained from the plant in some places almost without cost, while in others the cost of gathering the twigs would equal the wholesale value of the lac. I have received specimens of the plant from six different places in the deserts of California and Arizona, gathered at stations within a distance of 200 miles, and these all show the work of the insects and the presence of lac in quantities that would pay for gathering.

Assuming that the lac is to be found on the plants in the desert in the abundance that it is found in the specimens that have been forwarded to Mr. Stillman, of the University, and to me, I can see no reason why the gathering of the twigs would not afford profitable employment to hundreds of men and boys. The only capital required would be for the purchase of a tent for shelter, blankets and sufficient food to last until the first shipment of seed or stick lac could be sold. The twigs so covered with the nests of lac as to have stopped the growth of the branch are broken off, tied into a bundle and sold as stick lac. The nests of lac rubbed off the twigs and gathered in a bag are sold as seed lac. A little more capital for the purchase of a large iron pot, a smooth, hard-wood hoard or marble slab, and some narrow, coarse, cotton bags would be necessary if it was desired to make the shellac and lac-dye.

In a few weeks it will be known in what parts of the desert near the railroad the lac is to be found in abundance. Since Mr. Stillman's article on this subject was read before the Academy of Sciences, it is reported that the agents of the Chinese companies have been making an examination with a view to opening up a new and profitable industry for their people. If the lac is found in the abundance that thus far seems probable, it is to be hoped that the business of gathering it will be followed by white men and boys, for, while giving them profitable employment, it will in addition save to the country the large amounts of money now sent abroad for its purchase.

San Francisco, March 12, 1880.

The Snake River Placers.—A correspondent of the Boise *Republican* from Salmon Falls, gives an encouraging outlook for the placer mining in that district. A number of new machines have been put up this winter, and ditches are being dug for the opening of new claims in the spring. The weather was so mild in February that most of the machines were kept running a greater part of the month. Salmon Falls district hide fair to be a busy point yet, as the longer the mines are worked the more familiar the miners become with the art of saving the fine gold, and as the ground is not limited in extent the yield of dust in the near future promises to add largely to Idaho's gold yield.

The celebrated Iron mine at Leadville has been sold for $3,000,000.

How England Takes Her Census.

In Great Britain a census has been taken every ten years since 1801, and the system is now one of the most perfect in existence. Until near the close of the last century, there was no real method, and all previous estimations of the population of the United Kingdom were mere guesswork. It seems the more strange that such should have been the fact, considering that, in the American colonies, enumerations of the population had often been made by order of the home government. In 1790, a beginning was made in Scotland by Sir John Sinclair, who through his personal efforts in enlisting the co-operation of all the clergymen of the established church, collected returns which were of great value, though necessarily incomplete. After seven years he completed his compilations, and published the results in 21 volumes, probably the greatest statistical work ever undertaken and carried through by one private enterprise. Under the system adopted in 1851, the census in Great Britain is now taken in one day, the 31st of March. In 1851, 30,610 enumerators were appointed in England and Wales by the 2,190 district registrars in those countries, each enumerator having a distinctly defined district assigned to him. In Scotland the 32 sheriffs appointed the temporary registrars—generally parish schoolmasters—and 8,130 enumerators. For the smaller islands, the government appointed 257 enumerators, and in Ireland the census was taken by the constabulary. Some days before the census day, printed schedules were delivered at every house or tenement; in Wales these were printed in Welsh for the benefit of the lower classes. These schedules contained questions about the name, relation to head of family, condition, age, sex, occupation and birth-place of every person in Great Britain, and also as to the number of deaf, dumb and blind. Measures were taken to secure accurately the names of night laborers, persons out of the country, travelers, seamen, soldiers, etc. These schedules were all filled up in the night of March 30-31 and were taken up at an early hour on March 31, the collector filling up the parts that had been left blank through their negligence or inability. All unoccupied houses and buildings in course of construction were also noted. The floating population—persons who spent the nights in boats and barges, in barns, sheds, etc., were required to be estimated as nearly as possible. The enumerators were allowed one week to make their returns in, all transcribed, and the summaries and estimates completed according to detailed instructions. The district registrars had to complete their revision of the returns of their subordinates in a fortnight, paying particular attention to nine specially defined points. These revised returns were again revised by the "superintendent registrars," and then transmitted to the census office. The census was the most successful, in quickness and accuracy, accomplished in any country up to that time, and the same system has been pursued, with little variation ever since. The digestion of the census reports by the central authorities is conducted most thoroughly and scientifically, and the compilations are of the greatest value to statisticians and economists. The British system has served as a model for many other countries, where the census is now taken in one day by means of printed schedules.—*Boston Herald.*

Long American Bridges.

Since the disaster of the Tay bridge there has been some uneasiness felt as to the safety of some of the iron and suspension bridges in this country. Many of them have spans much longer than those that fell into the Firth of Tay, the destroyed spans being only 245 feet long. The bridge nearest home, and one in which Baltimore is especially interested, is that over the Susquehanna river at Havre de Grace. It has 13 spans, each over 270 feet long. It was completed in 1866 of wood, and when nearly finished a large portion of the superstructure was blown down. Since 1876 the wooden portion has been replaced with iron by the Phœnix and Edgemoor iron companies, the work being accomplished without any interference with the freight and passenger traffic of the Philadelphia, Wilmington & Baltimore railroad. The draw section of the bridge will he replaced with iron within a month or two, when it will sustain its character of being one of the longest iron railroad bridges, as it was previously one of the longest wooden bridges. The truss bridge at Cincinnati has a span of 513 feet; that over the Hudson, at Poughkeepsie, has five spans of 500 feet, and the piers are 135 feet above the high water level. The bridge across the Missouri, at Leavenworth, has three spans of 340 feet each. The span of the bridge that gave way at St. Charles, Mo., in consequence of the cars leaving the track, was 320 feet, and it has two others of 406 feet each. The bridge at St. Louis has one span of 500 feet and two of 515 feet each. The suspension bridge at Cincinnati has a clear span of 1,075 feet, while the bridge over the East river, at New York, exceeds that length, having a span of 1,595 feet. Since the Tay disaster there have been so many inquiries as to the safety of this structure when exposed to the force of a gale of wind, that the engineers interested have made reassuring statements. It is asserted that a gale of 100 miles an hour would bring a force equal to 1,506 tons, while there would be a sustaining force of 4,124 tons.—*Baltimore American.*

The Alexander Mine—A Mountain of Ore.

Isaac McConnell, of this city, recently returned from a trip to Grantville, Nye county, and is well pleased with the mining outlook in that region. The leading mine at Grantville is the Alexander, which is now producing bullion to the value of $37,000 per month. They have a regular mountain of quartz. They suppose their vein to be 200 or 300 feet in width, but have never yet been through it to either wall. The mine is opened by means of tunnels, and the ore is blasted out as stone would be taken from a quarry. The ore is extracted and delivered at the mill for eight cents per ton. All that is to be done is to blast it down, shovel it into cars, run it to the mill and dump it.

This ore averages $33 per ton, and it costs $9 per ton to mill it. The ore contains a considerable amount of iron and antimony, and after being dry-crushed is roasted with salt, when it is ready for the amalgamating pans. To ten tons of ore is used one ton of salt. The salt used is that formed in the salt fields and marshes in the vicinity, and contains a considerable amount of soda and borax; indeed it is only about 60% salt. The minerals found with the salt are supposed to improve it for the use to which it is applied. By the process in use the ore is worked to within 95% of its assay value. Recently a winze has been sunk from the lower tunnel to a point below the water level, and it is found that the ore at that depth is much richer than above, averaging $150 per ton.

In the mine they have in sight about 80,000 tons of ore with some 40,000 tons extracted and stowed away in bulkheads.

This mine is about being purchased by Alvinza Hayward and W. S. Hobart for $1,000,000. The owners—it is said—have agreed to take this price, and that all hands have gone to San Francisco to complete the trade.

The country rock is limestone and quartzite, and the mineral veins are abundant. At a point 18 miles north of Grantville are some very promising mines from which Mr. McConnell brings some rich and handsome specimens. Most of these mines are owned by men of small means.—*Territorial Enterprise.*

A Sword Forged from a Meteor.—There is now in the museum at the City of Mexico, a remarkable sword, made from an aerolite or meteor that fell in the State of Durango, Mexico. A Mexican gentleman sent to Gen. Ord, of the United States Army, a small slab or tablet, about an inch thick and six inches square, which was sawed out of the meteor. It resembled iron, and, in fact, was what is known as meteoric iron. The piece weighed two pounds. Gen. Ord sent it on to the national armory at Springfield, to be worked up into a sword for Gen. Trevino, of the Mexican Army, who has done so much to rid our border of the Indians that infested it. Considerable trouble was experienced in annealing the meteoric iron, but at last they succeeded, and, with the scabbard, it forms a very creditable specimen of American skill. The sword is a small, straight blade, and is a fancy-dress sword, the mounting representing an eagle with the olive branch and arrows, such as we see on a quarter of a dollar now and then. The grip is of silver wire, and the whole thing is very pretty. On the blade is the Spanish sentence, which, translated into English, reads: "Made of iron that fell from the skies of Mexico. Presented to G. Trevino, General of Division, by his friend, Gen. Ord, U. S. A."—*Manufacturer and Builder.*

Copper in Idaho.—As soon as the Utah & Northern railroad is completed down Snake river, copper mining will be an industry that will give employment to a great many men, and bring money into the country. There are hundreds of mines there, some of the ledges being very wide, and from 70% to 90% copper. They are near the line of the road, and in positions where they can be worked with but little expense. There are also copper mines on the Weiser, but it is not known whether they are extensive. However, those on Snake river are of sufficient extent to give Idaho a reputation abroad as a great field of this kind of mining as soon as the railroad is extended to them and they can be worked.—*Idaho World.*

The Single Track Railroad.—The test of the James single track railroad system, made recently at Antioch, is pronounced a success by all reports which have come to our notice. We are glad of it for this, if found finally to be as good as it now appears, will open to easy access many rich valleys and uplands, which now lie out of reach of the railway, and will make their products much nearer to the central markets in point of time and cost of transportation. There is a project now under way to build a single track road down the west side of the San Joaquin valley, and if this succeeds, there may be a score of cheap railway lines expected in all parts of the State.

An Old Shaft.—On the top of the Dragoon mountains northwest of Cachise Pass has been discovered an old shaft sunk upon iron croppings of the usual kind of this country. The shaft has been explored to a depth of 75 feet, but not to the bottom, nor could it be told how far it was to the bottom. The vein goes down with the shaft. An old arastra was also discovered close by, much worn, with four large drag stones. No one ever heard of it before. It appears to be very ancient as judged from the growth of shrubbery about it.

Frozen Meat from the Antipodes.

Last November a ship laden in Australian ports with fresh meat for England, which it was expected would be kept from decay by a freezing process. Our last English mails bring accounts of the arrival of this ship at London and interesting details of the voyage and its results. It may be said in a word that the effort yielded success, and that meat slaughtered in Australia in November last was served on London tables during the first week in February in good, fresh, palatable condition. This certainly is one of the most notable events of the century.

The vessel chartered for this experimeat by the Australian government was a steamer, and her course lay through the Suez canal and the Mediterranean. The work of shipping began on November 18th at Sydney. The beef was taken in at a temperature of 70° Fah., and that on this day the maximum temperature in the meat chamber in the ship was 26° and the minimum 2° Fah. On November 29th the ship left Sydney, the temperature of the sea water being 69°, the maximum in the chamber 28° and the minimum 16°. Four days were passed at Melbourne, where more sheep were taken in. Here the temperature of the sea water was 61°, the maximum in the chamber on December 4th being 32°, and the minimum 6°. Leaving Melbourne on December 6th, the temperature of the sea water rose on some days to 83°, while the highest point reached by the thermometer in the chamber was 26°, and the minimum 5°. At Aden, January 7th, the temperature of the sea water was 78°, the maximum in the chamber 21°, the minimum 5°. At Suez, January 14th, the temperature of the sea was 62°, the maximum in the chamber 23°, and the minimum 3°. At Gravesend, February 1st, the temperature of the water was 40°, the maximum in the chamber 27°, and the minimum 9°. During the voyage, however, the machine was only worked for about five hours a day. No difficulty was experienced during the voyage through the Indian ocean and by the Suez route, though naturally some had been apprehended, 23 days being spent in the tropics.

Concerning the condition of the meat when it reached the London butchers' stalls, all reports which we have received agree. It was frozen solid, and when first taken to the stalls "sawed up like so much stone." In appearance it was excellent. It sold readily, and samples cooked for the purpose of satisfying experts and reporters were pronounced very good, in some respects equal to the freshly slaughtered beef and mutton of the English butchers.

This result was gained by a process of freezing induced by the compression and expansion of air by the aid of a steam engine and air pumps. The freezing processes by the use of chemicals are regarded unfavorably by shipowners, because of the anticipated danger to vessels and its general cargo, but the compressed air process is unobjectionable.

The Victoria Regia Surpassed.

If our Golden Gate Park Commissioners propose to sustain their eminence as introducers of the majestic in floriculture, they must lay their Victoria Regia aside and open correspondence with the authorities at Florence, Italy. For we read in a European exchange that Signor E. Boccari, an Italian, has recently discovered in Sumatra a plant which he names *Conophallus titanum*, the flowers of which completely obscure the blossom of the Victoria Regia. According to the published description of this plant, the swell of the spathe is 32½ inches in diameter, and the naked portion of the sphadix measures no less than 5½ feet. The color of the spathe is a brownish purple-red, and that of the sphadix a dirty yellow, as is generally the case with flowers which, like the *Conophallus* and the *Rafflesia*, attract, by their peculiar odor, insects and animals feeding on carrion. The tuft of this plant, of which at first Beccari only succeeded in finding one specimen, was 3½ feet in circumference, and so heavy that two strong men could scarcely manage to carry it; its single leaf had a stalk 10½ feet long, and 35 inches in circumference at its base. The leaf stem is smooth, green, and thickly covered with circular white spots. The three branches into which this stem divided at its upper end were as thick as a man's leg, and by repeated subdivisions form a spread over 9 feet long, supporting a leaf whose superficial surface exceeds 15 square yards. The stalk of the fruit is about the same thickness as the leaf stem, and in the example found by Beccari the fruit-bearing portion of it was 20 inches long by 30 inches in circumference, and thickly covered with olive-shaped fruit of a reddish color. Some seeds of this plant, which Beccari sent over to Italy, have been cultivated in the hot-houses of the Villa di Seeto at Florence, and the young plants springing from them are said to be growing fast.

The oldest specimen of pure glass bearing anything like a date, is a little molded lion's head, bearing the name of an Egyptian king, of the eleventh dynasty, in the Slade collection at the British Museum. That is to say, a period which may be moderately placed as more than 2,000 years B. C.

Large deposits of black sand, said to contain platinum, have been discovered near Olympia.

Useful Information.

The Chemistry of Rust.

In a paragraph on the rusting of metals which we find in the "scientific column" of one of the city newspapers, we read that "rusting or tarnishing is always oxidation, or, in other words, the chemical union of the metal with oxygen, which it takes up from the air or water to which it is exposed."

The statement is too sweeping and comprehensive. Iron rust is what the chemist calls "a hydrated sesquioxide of iron ($2Fe_2O_3, 3H_2O$)." In its ordinary condition the metal is not affected by perfectly dry air, but if moisture is present the oxidation and hydration soon occur. The process goes on more rapidly in air containing carbonic acid. The water is then decomposed and carbonate of iron is formed; this is dissolved by the carbonic acid, the solution absorbs oxygen from the air, and the sesquioxide is deposited in a hydrated state. The succession of chemical reactions may be expressed by the following equations:

$$Fe + H_2O + O = FeO, CO_2 + H_2;$$

$$2(FeO, CO_2) + O = Fe_2O_3 + CO_2.$$

The absorption of water converts the Fe_2O_3 into $2Fe_2O_3\,3H_2O$.

When iron nails are driven into unseasoned oak timber, a black stain will be seen around the head of each nail. It is virtually an *ink* stain, caused by the formation of tannate of iron from the action of the tannic acid in the wood upon the metal, or upon a carbonate of it, which has been first formed. The "iron-mold" stains produced by the contact of wet linen or cotton cloth with iron are also due to the solution of carbonate of iron absorbed by the fibers of the cloth. A similar stain is left by ink (that is, an ordinary black ink, made by the action of tannic acid on iron), after the fabric has been washed with soap, the alkali of which removes the tannic acid. A solution of oxalic acid takes out the stain by uniting with iron to form a colorless and soluble salt, which is easily washed out.

The rust of copper, or the green film which gradually forms upon it when long exposed to moist air, is not an oxide, but a carbonate. This is often incorrectly called *verdigris*, sometimes even in books of chemistry, but that name is properly applied to the acetate of copper, which is produced by the action of acetic acid or vinegar upon the metal. When copper is exposed to the action of sea-water, as when used for covering the bottom of ships, it also acquires a green coating; but that is an oxychloride of copper, probably due to the conversion of copper into oxide by the air in the water, and the subsequent decomposition of this oxide by the salt, or chloride of sodium. The rich green tints of old bronze, or produced artificially on that which is new, are due to the rusting of the copper in the alloy.

The dark film which forms on lead by exposure to the air is probably a suboxide, but chemists are not fully satisfied as to its nature. The white coating which results from exposure to carbonic acid is the carbonate, or what is commonly known as "white lead." In water containing little or no free carbonic acid, this coating protects the metal from further corrosion; and the same is true of a coating of sulphate of lead, formed by the action of water containing sulphates or sulphuric acid. If there is much free carbonic acid in the water the deposit of carbonate is soon dissolved, leaving the surface exposed to fresh attack. The blackening of lead and of surfaces painted with white lead, by contact with sulphureted hydrogen and other sulphur compounds, is caused by the formation of a sulphide. This also forms a protective coating; it is on the whole the best preventive of corrosion in lead water-pipes. If such pipes are employed for conveying water used for domestic purposes, they should first be filled with a strong solution of sulphide of potassium (half a pound of the salt to a gallon of water), which should be allowed to remain in the pipe until the whole inside is thoroughly blackened.

Silver is another metal which rusts or tarnishes by long exposure to the air, and from various other causes, but the process is not one of oxidation. The metal has little affinity for oxygen, but a peculiar liking for sulphur, with which it is always ready to unite wherever it can find it. The amount of sulphur ordinarily present in the air, chiefly in the form of sulphureted hydrogen, is almost infinitesimal; but the silver is prompt to take the sulphur away from the hydrogen, and to veil its polished whiteness with the black compound it forms by appropriating the plunder. Coal-gas is never wholly free from sulphurous impurities, and the more rapid tarnishing of silver where gas is burned shows the presence of these in the air. Our readers are aware that eggs contain sulphur, and the blackening or browning of the silver spoons we use in eating them is the result of this affinity of silver for sulphur. The instant the spoon is thrust into the egg the chemical combination in which the sulphur exists is broken up, and a new combination, the sulphide of silver, is produced. The same happens, as is well known, with a silver spoon put into a mixture of mustard, or into a dish of boiled onions, both of these vegetables containing compounds of sulphur. We were interested, not long ago, in noticing how black a silver coin had become which had been for some time in a box with a small piece of "vulcanized" india-rubber used for erasing pencil marks. Sulphur is used in the vulcanizing process, and the silver had taken it from the rubber, or rather from the air in which a minute portion of the sulphur had been volatilized.

These familiar illustrations of the "rneting" or tarnishing of common metals show that "oxidation, or chemical union with oxygen," is far from being the full explanation of the phenomena, and that a great variety of curious and interesting reactions are involved in them.—*Boston Jour. Chemistry.*

Paper Boxes.—By a recent invention, paper boxes are made in Boston directly from paper pulp. The boxes are turned out of any size or shape perfectly seamless and of uniform thickness. After drying, the boxes are run through a second machine at the rate of 60 per minute, receiving, under a pressure of 4,000 pounds, such embossing as may be necessary. From the time the paper stock is taken from the bales until the perfect box is turned from the machine, manual labor is entirely avoided. By the use of one set of these machines 30,000 boxes can be produced per day, at less than one-third of the lowest market price of hand-made goods, and doing the work of 200 hands as the process is ordinarily conducted.

Recovery of Tin from Tin-Plate Scraps.—According to a patent by Larocque, tin scraps are mixed with finely powdered charcoal and one-half per cent of salt, and placed in a kettle that can be closed, supplied with a horizontal perforated diaphragm in the middle. The upper portion is then heated red-hot, whilst the lower is cooled with water, when the tin melts, and runs through.

A correspondent of the *Zeitg. f. Blechindustrie* states that alloys of seven to eight parts of lead and one part of zinc protect sheet iron better against rusting than pure tin or lead, and that the plate thus covered is more suitable for certain purposes than ordinary tin plate. He adds that the addition of a little antimony increases its resistance to oxidizing influences.

Good Health.

Damp Rooms, Damp Beds, Etc.—Damp rooms, as those in brick houses—in which the plastering is placed directly on the walls—are the fruitful sources of many of the acute or inflammatory diseases of our changeable climate. Rooms, also, seldom or never properly ventilated or sunned, in damp localities, with houses the cellar of which is wet for any considerable part of the time, are absolutely unfit for human residences. No families can occupy such houses, living on the north side, and ordinarily escape the rheumatism and kindred diseases. It is but little less than suicide to be subjected to such continued dampness. Of course the bedding of such rooms must be not only damp, but to a certain extent moldy, or have a musty odor—almost certain to produce colds and diseases, especially when the "spare bed" is used by those who are so unfortunate as to visit such houses. Such beds are unsafe, occupied only occasionally, even after having been thoroughly aired and supplied with fresh and dry blankets. If such localities must be occupied, it is judicious to use bedding that will absorb as little as possible of dampness and foulness—the mattress is superior in this regard to feather-beds—while almost daily airing becomes needful. Dark closets, closed trunks, bandboxes and the like, containing clothing, need often to be aired, allowing sunlight, the prince of purifiers, free access, often to be removed and placed in the direct rays of the sun, with a careful removal of all mold. Some free absorbent of moisture, freshly slaked lime, salt and ashes,' and the like, will absorb this moisture, which may be promptly removed, at least carrying off much of the dampness. These absorb more readily and more freely than the clothes do, and will obviate a part of the evils of damp houses, and yet nothing can be an adequate substitute for the light of the sun—not even a warm fire in the room.

Snow Eating Unhealthy.—A writer in the *Phrenological Journal* admonishes parents to guard their children from the practice of snow eating, claiming that it has much to do with head colds of many girls and boys, because of the chilling effect of snow upon the palate or thin partition between mouth and nostrils producing congestion in the fine membrane which lines its upper surface. As this membrane is almost entirely constituted of delicate nerves and blood vessels, inflammation is likely to follow the congestion, and perhaps degenerating into nasal catarrh, an affection so common with persons in our northern latitude.

Disinfectant for the Breath, etc.—A very weak solution of permanganate of potash is an excellent disinfectant for light purposes, such as rinsing spittons, neutralizing the taint of diseased roots of teeth, cleansing the feet and keeping the breath from the odor of tobacco smoke. While the above statements are strictly correct, we feel called upon to state that the permanganate of potassa is altogether too expensive to use for the purpose above named. A very diluted solution (1% to 2%) of chloride of zinc will answer quite as well as the permanganate, and costs almost nothing in comparison.—*Manufacturer and Builder.*

Light in the Home.

The eminent English writer, Dr. Richardson, produces in one of our contemporaries, an article called "Health at Home," which is replete with wisdom. A most important point, and one on which he dwells, is the fact that so many people are afraid of the light. "In a dark and gloomy house you never can see the dirt that pollutes it. Dirt accumulates on dirt, and the mind soon learns to apologize for this condition because the gloom conceals it." Accordingly, when a house is dark and dingy, the air becomes impure, not only on account of the absence of light, but from the impurities which are accumulated. Now, as Dr. Richardson cleverly puts it, we place flowers in our windows that they may have the light. If this be the case, why should we deprive ourselves of the sunshine and expect to gain health and vigor? Light, and plenty of it, is not only a purifier of things inanimate, but it absolutely stimulates our brains. It is in regard to sick rooms that this excellent authority is particularly impressive. It used to be the habit of physicians in old times to sedulously darken the rooms, and this practice continues to some extent even to-day. In certain very acute cases of nervous disease, where light, the least ray of it, disturbs in over exciting the visual organs, this darkening of the room may be permitted, but ordinarily to keep light out of the room is to deprive the patient of one of the vital forces. Children or old people condemned to live in darkness are pale and wan, exactly like those plants which, deprived of light, grow white. Darkness in the daytime undoubtedly makes the blood flow less strongly and checks the beating of the heart, and these conditions are precisely such as bring constitutional suffering and disease. The suppression of the light of day actually increases those contagious maladies which feed on uncleanliness. Dr. Richardson states: "I once found by experiment that certain organic poisons, analogous to the poisons which propagate these diseases, are rendered innocuous by exposure to light."

A Specific for the Whooping Cough.—It has long been known that exposure to the perfumes of a gas-house produces a speedy relief to persons suffering with the whooping cough; but how or why such a result is brought about has not been shown until of late. In explanation we give the following paragraph, which we clip from the columns of a contemporary: "A sure cure." This is the language used by George Shepard Page, of Stanley, New Jersey—not by way of professional advertisement, but simply as an item of information to the people—in reference to that distressing disease, the whooping cough. It is only a short time since the cause of the complaint was discovered. The eminent microscopists, Henry Mott, Ph. D., and Edward Curtis, M. D., find that its seat is at the root of the tongue, where countless bactsria are generated, which produce spasms. Here is what Mr. Page tells us about his sure cure: A scientist in Providence, R. I., examined the liquid hydro-carbon deposited in the bottom of the purifying boxes, used at gas works, and separated cresolene ($C_6H_5CH_3O$)—a substance analogous to phenol. He vaporized the cresolene in a closed room, in which there was a patient suffering from whooping cough. Recovery was effected in two days. Many other trials have been made, and with nearly unvarying success. No cough or unpleasant symptoms remain. The patients are restored to perfect health. Eminent physicians have pronounced this discovery of equal importance with that of quinine. If this suggested remedy for whooping cough is found to be effective, Mr. Page will be entitled to the thanks of the public for making it known.

Moist Air Not Healthful in Dwellings. Briggs, the well-known engineer, maintains the theory that the summer condition of temperature, 62° to 68°, and relative humidity, 80% to 85%, is not desirable or attainable, at other seasons, in the heating of dwellings. His argument is, that the dry air of America possesses both curative and preventive qualities of great value, and that moist air, which promotes vegetable growth, is, on sanitary grounds, not desirable for breathing. He states that the dew point is far below the freezing point of water in well-warmed and ventilated rooms, where there is nothing of that sensation of dryness which is usually held to accompany the heat of a furnace when not supplied with water for evaporation. Again, new houses that are accounted unhealthy in Europe are not so in America, and gas burned in rooms produces much less unpleasant effects in America than in England. His views on this subject are fully set forth in the *Journal of the Franklin Institute.*

More About Color Blindness.—Dr. Keyser, who has spent eight months in examining train employees of railroads that center in Philadelphia, finds color blindness in 3½% of the whole number so marked that they were unable to distinguish one color from another, while 8½% although able to tell colors, were unable to distinguish shades, and were thus rendered incapable of performing duties required of railroad men. Two of the color-blind men had educated themselves to know that red is a bright, intense color as distinguished from green, which they described as dull. But when light green was put before them, they called it red. They explained that the green light had at times shown red to them, and they had stopped the trains. But suppose the red had shown green!

The Week.

The agricultural districts are still being favored with rain, and abundant harvests are looked for in the present season.

In the city, now that the excitement always attendant upon elections is over, it is natural to suppose that the varied departments of business will assume their general tranquility, and receive that close attention which has been turned out of its proper channel by the political contest.

There is a general advance in prices in many of the leading articles of trade, which amounts to nearly sufficient importance to merit the title of a "boom."

Real estate, though not marked by much activity, holds a more firm footing than it has done for a long period. In favorite locations there is an advance in prices asked, and holders are unwilling to accept of any reduction. In such localities rents are looking up and a better feeling is more prevalent.

The mining fever is unabated in the East. Prospectors are flocking over the mountains of Colorado, Idaho, Montana, Utah and Arizona. Everywhere are new mines being opened up and new camps being organized. Capital is flowing from the East with a free hand. Scarcely a day passes but we hear of purchases of mining property by Eastern people. All this is good for the mining interests of the coast, for we want the mines developed, even if the resultant bullion goes away from here.

One of the largest lumps of solid gold ever seen in this city was on exhibition at the office of the Pacific refinery, corner of Montgomery and California streets, a few days since. It was about 14 inches long by 7 in width and 6 in hight. Its value was estimated at $55,000.

The Board of Directors of the Pennsylvania Railroad have directed the restoration of the pay of all persons in the service of the company to the compensation in force at the time of the reduction in June, 1877, to take effect from and after April 1st.

Bullion Product, Mines and Reduction Works of Utah.

The value of the bullion turned out last year in Utah Territory, lead included, amounted to about five and one-half million dollars, made up as follows: 2,301,276 lbs. refined lead at 4½ cents per lb., $103,557.42; 26,441,359 lbs. unrefined lead at $45 per ton, $594,930.57; 3,835,047 ounces silver at $1.10 per ounce, $4,218,551.70, and 15,932 ounces gold, at $19 per ounce, $302,708; total, $5,219,747.69, to which may be added value of some small lots of ore unaccounted for. Owing to the low price of lead a good many mines and some of the smelters were closed down during the earlier part of the year, as they had been for several years before. Had the entire quantity of lead extracted last year sold at the prices now ruling, the bullion product of the Territory for 1879 would have reached $6,000,000 or more; and should present prices for that metal hold, it is estimated that the value of the bullion extracted in Utah will this year amount to fully eight and may even reach nine million dollars, as work has been resumed on many of the idle mines and nearly all the smelters have started up. Of the gold and silver turned out last year about $2,250,000 was the product of the mills and placers, apportioned among them as follows: The mill of the Ontario company, $1,165,180; Leeds district, $841,555; Bingham placers, $20,000; Stewart gold mining company, $100,000; other mills, $124,000, leaving $3,000 to be credited to the smelters. The gold-bearing quartz of Utah, so far as worked, this branch of mining being yet new in the Territory, has yielded at the rate of about $15 per ton, this gold being free and easily extracted. The yield of the millable silver ores has ranged from $60 to $100 per ton, some of these ores being free and some requiring roasting, while the smelting ores carry from 30 to 60 ounces of silver to the ton, with 25% to 50% lead.

Utah, though among the younger of our mining countries, is not without her superannuated mines and dead reduction works, some of which are to be met with in nearly all her earlier and more active mining districts. As before remarked, the most of these works, save only such as have been abandoned and given over to decay, are already or will soon be in active operation. Without attempting to give here a history of these establishments, some statements in regard to their locality, capacity and prospective production may not be without interest. To begin with:

The Ore Crushing Mills

Of this Territory, we have first the well appointed 40-stamp establishment of the Ontario company, Uinta district, situated some 30 miles southeasterly from Salt Lake City. This company have erected at their mine powerful steam hoisting works, two Stetefeldt and one White & Howland roasting furnace, the cost of their entire plant to date approximating $1,500,000. The Marsac mill in this district carries 20 stamps, 10 pans and five settlers, and is driven by a 170-horse power Corliss engine. The Empire company are about to put up on their mine here a 60-stamp mill, with revolving roasting furnaces, having already erected over their three-compartment shaft, now 400 feet deep, substantial steam hoisting works.

For working the ores in the gold mines of Bingham canyon, 30 miles southwest of Salt Lake City, are the following mills, owned by the companies mentioned: Stewart No. 1, 20 stamps; Stewart No. 2, 10 stamps; Jordan, 10 stamps; Durant, 10 stamps. Each of the three companies first mentioned, and also the Excelsior company, all of whom own valuable mines at that point, will erect on the Jordan river the coming summer quartz crushing mills carrying from 80 to 120 stamps each. In the Tintic district are the Wyoming, the Lock, the Ely and the Mammoth mills—the latter containing 27, the Wyoming 20, and the Lock and the Ely 10 stamps each. The mills of the Stormont and the Leeds companies, Silver Reef, carry each 10 stamps, the Christy and the Barbee & Walker mills at that place each five stamps. The Sparrowhawk 20-stamp mill at Camp Floyd, belonging to an English company, and for a long time standing idle, has been leased by the Carrie Steele company, and will now be run on the ores of their mine at that place. The Pioneer 20-stamp mill, put up by the Walker Bros. at Ophir canyon several years ago, has since been taken down and removed to Butte, Montana, where it is now being operated with great success on the ores of the Alice and other mines owned by those parties. There are besides the foregoing a number of small mills running in different parts of the Territory, and carrying perhaps an aggregate of 30 or 40 stamps, to say nothing of some few, generally of limited capacity and imperfect build, that have been taken down and removed elsewhere, or that are now standing idle, and which are for the most part in a dilapidated condition.

The Sampling Works and Smelters

Of Utah are numerous, and some of them of larger capacity, as the following statement of the products made last year by a few of the large establishments tends to show: At the Germania Smelting and Refining Works there were turned out 2,301,276 lbs. refined lead, 344,836 ounces silver and 2,202 ounces gold; by the two smelters run on the product of the Horn Silver mine, 9,794,130 lbs. unrefined lead, 596,249 ounces silver and 642 ounces gold; by the Mingo Furnace company, 3,925,104 lbs. unrefined lead, 245,339 ounces silver and 931 ounces gold; by the Morgan smelter, 2,673,200 lbs. unrefined lead, 257,568 ounces silver and 1,480 ounces gold, and by the Old Telegraph company's works 6,128,927 lbs. unrefined lead, 153,735 ounces silver and 92 ounces gold, considerable quantities of those metals having been turned out by some half dozen other smaller works run for a portion of the year, the total amount of these several products shipped from the Territory during 1879 having been 2,301,276 lbs. refined lead, 26,441,359 lbs. unrefined lead, 1,797,589 ounces silver and 5,693 ounces gold. The most of the sampling works and smelters in Utah are situated in the long valley extending south from Great Salt Lake, and lying between the Wasatch mountains on the east and the Oquirrh range on the west. Here is the Pasco, Mungo, Germania, Morgan, Old Telegraph and other large establishments all now running, besides several that have passed away, one having been burnt up and the others having for various reasons fallen into disuse have since been dismantled, and finally suffered to go to ruin. At Sandy, on the Utah Southern railroad 13 miles south of Salt Lake City, are located the principal sampling works, this being the point near which several branch railroads coming down from the mines connect with the Utah Southern road. To these works the smelting ores are taken and properly sampled. The agents of the smelters buy by these samplings, allowing one dollar for every ounce of silver they contain, but nothing for the lead unless it amounts to 30%; for every unit above that 50 cents is given.

Extraction of Copper by Sulphatation.

Of all the various processes employed for the separation of copper from its ores, almost all are expensive, tedious and very complicated; therefore, it is of the greatest importance to do away with the ordinary ponderous routine of manipulation and adopt a method which would give good results in much less time, and at a smaller expenditure of fuel. Consider, for instance, that complicated system of metallurgical treatment adopted in England and which is called "the English method of copper smelting," where more than half the copper consumed in the world is annually produced. The ordinary method of this process includes *ten distinct operations*—by roasting and reroasting, melting and remelting, etc., etc. But the study of the solubility of metallic salts, and the agencies by which they are precipitated—which, indeed, is the most useful and interesting branch of metallurgical research—has of late brought forth several new processes, which are technically called "the wet methods." These processes are employed to effect the separation and reduction of this class of bodies, based on their solubility either in water or in other liquids.

It is an established fact that the various minerals of the copper class are all readily converted into sulphates by the action of sulphur, in the form of sulphuric acid, on their oxides. These sulphates are soluble in water, and are precipitated by metallic iron. The action of this well-known chemical affinity is as follows: The acid and the oxygen desert the copper and transfer themselves into the iron, forming sulphate of iron (green vitriol), and the copper is deposited in a crystalline and metallic state of almost chemical purity. The theory of the process is based entirely on the above facts. The largest quantity, by far, of the ores of copper are its sulphurets, viz: the glance, pyrites, erubescite, or the horse-flesh ore (as the Cornish call it), the gray copper ore, etc., which could be converted into sulphates easily without any reagents, unless at the last stage of their roasting. Still, when oxides, or carbonates, etc., are operated upon, they must be either mixed with a certain amount of sulphurets or with a certain quantity of salt-cake (the anhydrous Glauber salts), or even with sulphate of iron. Practice points out the salt-cake to be the best, because it forms sulphuric acid with more facility.

The first establishment erected to work this process on an extensive scale was, we believe, the Red Jacket copper works, situated some four or five miles from Swansea. They effect a pretty good extraction of the copper; but the difficulty is that Mr. Bankart, the inventor, cannot convert the entire oxides (formed during the roasting) into sulphates by one operation, and his remedy in this case was to roast the tailings, with a due admixture of sulphurets, in the raw state, and continue these successive operations until almost the whole of the copper has been extracted.

But, in order to overcome this obstinate difficulty and the perpetual rehandling of tailings, the use of a certain quantity of salt-cake, or calcined green vitriol, is sufficient to effect the conversion of the entire oxides into sulphates.

The following description will give some idea of the method employed:

1. The ore from the sacks is emptied upon a drier heated by the flue of the roasting furnace. When thoroughly dry, it is pulverized, first, through a rock-breaker, with jaws set close, from which it is made to run into either a stamp mill or a drum-pulverizer, similar to Paul's. The latter gives very good satisfaction. The size of the screen depends entirely on the character of the gangue. Experiment in this case alone must determine the degree of fineness to which the ore must be ground. That the size of sand is quite sufficient for ordinary ores; for, if the particles are much finer, they form a slime which is rather troublesome during lixiviation.

2. Next the pulverized ore is exposed in a proper furnace to a low red heat for several hours. The shape, size and form of a roasting furnace is a matter of great importance. A very efficient furnace is the two-hearth reverberatory, where the cheapness of construction, the economy of heat, etc., are of great advantage. The principal object in the roasting of the ores in this process is the formation of sulphates; the vitreous copper ores, pyrites and the other sulphurets when red hot and acted upon by the oxygen of the air are changed into sulphates by oxidation of the sulphur to sulphuric acid. The metal of the sulphurets cannot unite with sulphuric acid in the furnace unless it first becomes an oxide; therefore, when the last portion of the ore is changed into oxide there is not sufficient quantity of sulphur in the furnace to add forthwith an atom to the sulphurous acid to change it into sulphuric acid, a certain portion of the ore in consequence is left as oxids, and causes the tailings to be too rich. Now comes the necessity of introducing a certain quantity of anhydrous sulphats of soda (salt-cake) or some calcined green vitriol, in order to convert the oxides that are left unsulphatized entirely into sulphates. By thoroughly understanding this simple method the tailings will be found very poor indeed.

3. After the ore is thus sulphatized it is next taken into a large filtering vat partly filled with hot water, to be leached. Care should be taken that the ore is evenly and well spread, and being thus wet it will not cake, but will permit the water to percolate uniformly through it. Underneath the hot water that flows in, a piece of board is fastened to the spout in order to keep the water from making a depression in the mass and escaping through the filter without penetrating the ore. The vat is to be covered, that the heat may be retained, because the salts are more soluble in hot than in cold water. A few inches should be always kept on the ore, and the inflow and outflow are to be regulated in such a manner that they co-operate just evenly. In order to obtain a good and speedy filtration a little knowledge how to fix a proper false bottom is required, but this is so ably explained in Kustel's works that it could be made with but very little practice.

4. The liquid, which now contains the copper salts in solution, is pumped out of the leaching-vat into a settling tank, from which it flows gently but steadily into a series of precipitating boxes filled with clean iron scraps, old boiler-tubes, etc., the copper is precipitated more rapidly by wrought iron than by cast iron, and but very slowly by iron filings, the best by far are the old boiler-tubes. About 1,750 pounds of iron ought to throw down one ton of copper. The iron in these precipitating boxes is replenished according as it is destroyed by the copper. From time to time these boxes are emptied and the cement copper is washed with water and passed through a screen to separate any fragments of iron used in its precipitation; it is then taken out of the washing-barrels, dried at a gentle heat, sacked up and could be sold as cement copper at about $400 per ton. But if ingots are preferred the cement copper could be refined in a furnace such as is used for refining blister copper, poled with a green stick of wood in the usual manner to form hydrogen, which agent takes away the last remains of oxygen. When the copper is a little difficult to refine, on account of some inseperable particles of iron in the cement, a certain amount of lead is added to it, which acts as a purifier and assists the scorification of the iron, then it is cast into ingots of pure copper.

The liquor which flows out from the last precipitating box ought to be entirely free from soluble copper salts, but it contains a vast amount of sulphate of iron (green vitriol), which could be collected by crystallization if it does not contain other metallic impurities; these crystals could be reduced by calcination, and heated for some hours at a red heat with pulverized anthracite coal in a close-vessel, to a spongy metallic iron. This spongy iron precipitates copper very rapidly from its solutions. On the other hand the calcined green vitriol could be utilized as a substitute for anhydrous Glauber salt (the well-known salt-cake) for the final sulphatation of the ore in the roasting furnace.

It is obvious from the description given that this process is simple and cheap. The roasting does not occupy as much time as the other "wet methods" do; more work is accomplished with fewer hands, and less fuel is consumed. One cord of wood will on an average convert four tons of sulphurets into sulphates, and one ton of coal ten. The lixiviation is also effected much quicker; sulphate of copper is more soluble in hot water than oxide of copper is in a solution of neutral proto-chloride of iron, or chloride of copper in a solution of common salt. Sulphurets that contain between 10% and 15% of copper could be worked by the process of sulphatation with profit, also carbonates, oxides, chlorides, etc., if they only contain between 15% and 20%.

If there should be sufficient quantity of silver present in the ores of copper to warrant its extraction—as it is often found in the argentiferous gray copper ores—a different treatment must be adopted, though sulphate of silver is soluble in water; but in forming *that* sulphate by the higher heat of the furnace the copper is changed into oxide. But as the object of this article treats only on the method of extracting *copper*, it is not within its province to treat on the extraction of silver.

Square Locations.

EDITORS PRESS:—There are two sides to every question, and, except in regard to the expense involved, the general opinion here is in favor of the proposed alterations of the mining laws. This objection could be met by allowing patent to be issued after, say $100, were expended, instead of $500, as proposed.

At present, it is simply impossible for any one to tell whether ground is open for location or not, and the result, as hundreds here can tell, is that, after a location is made, if any good prospect is struck, it is far more likely than not to be claimed under some old location. It is always a difficult thing to prove that a man has *not* done the statutory work, while it is morally certain, nine times out of ten, that the ground is really open to location, and would have lain idle unless the new-comer had made a discovery of value.

It is no answer to say that the present law requires the boundaries to be marked. Four small stakes may be set among brush, where they cannot be seen, and this is held to be compliance with the law.

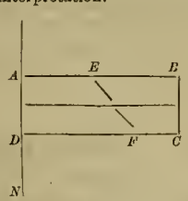
In regard to district regulations, they are almost entirely obsolete in California, and where they do exist, one can hardly tell when they are and when they are not in conflict with United States laws. For instance, most miners record locations with the County Recorder; some, however, know that a district recorder was appointed, say, 20 years ago, and still has the book in his possession, and make their record with him. What is the authority for recording with the county recorder—never appointed at any miner's meeting? And, on the other hand, what title has a man, elected 20 years ago, and who is only found in an occasional district, to keep such a record, the existence of which is scarcely known?

The obvious remedy is to have some definite record of location, such as is given in the proposed law. The time has been extended in committee to one year, which fairly meets the objection that 90 days gave no fair chance for discoveries.

The objections against vertical boundaries seem exaggerated, when it is considered that claims 900 feet long by 1,000 feet broad would be allowed.

This is more than the average length of the Comstock mines, and embraces as much as is generally made use of, and it is only fair to assume that future locations would place the croppings within 50 or 100 feet of the side-lines, leaving, in the case supposed, 900 or 950 feet on which to follow the ledge, which, at the average dip of about 65°, would give possession about 2,000 feet downwards along the ledge, and there are only two or three mines deeper than this in California.

The absolute necessity for some change is clearly seen in the following case, in which there is no room for difference of opinion as to the literal interpretation:



Let *A*, *B*, *C*, *D*, be an ordinary 1,500 feet, by 600 feet location. Section 2322 of the Revised Statutes gives "exclusive right of possession" to all veins throughout their entire depth, the top or apex of which lies inside of the surface lines of location, "although such veins may so far depart from a perpendicular in their course downward as to extend outside the vertical side lines of such surface locations; but their right of possession to such outside parts of such veins or ledges shall be confined to such portions thereof as lie between vertical planes drawn downward, as above described, through the *end lines* of their locations, so continued in their own direction that such planes will intersect such exterior parts of such veins or ledges."

Let *E*, *F*, be a cross-ledge dipping towards *A*, *D*, with no adverse nor adjacent locations thereon at date of this location *A*, *B*, *C*, *D*. "Continue in its own direction" the end line *A*, *D*, indefinitely, or say one mile to *N*, then, in terms of above section, the locator has a good title to the portion *D*, *F*, *N*, and as *N* can be any distance off, practically the *whole* ledge (except the mere surface) down to the line *A*, *D*, *N*, is granted, and the locator can hold against any future location on that ledge in that direction.

This is no merely theoretical case, but is under consideration at present, and that it has not been hitherto raised arises from the general ignorance prevailing in regard to the detail of these matters. Such an objection is more serious than can be made to the new proposals, especially as there is no limit to the number of locations that can be made either along or across any given tract.

The charge made in your current issue by Mr. Emersley that the proposed changes are "emphatically and unequivocally a deep-laid scheme in the interests of monopolists having a command of money," can be shown to be absurd by simply stating that such parties, if they so choose, can at present locate and hold with less outlay a hundred times more than they have ever shown any disposition to do, and one main object of the proposed change is to get the records clear of locations, dozens of which are everywhere held by one party, with no intention of working them, but simply to keep alive a blackmailing claim on any future prospector who may make a discovery of value. —R. B. SYMINGTON, Nevada City, Cal., March 29, 1880.

Legislative Matters.

As the close of the session of the Legislature approaches, it becomes evident that large numbers of the bills introduced will of necessity be killed, and that many now being introduced will fail to pass from lack of time for proper consideration.

The principal topic of interest to miners which has been discussed during the past week has been that relating to the debris question. A number of the members of the Legislature made an excursion to Bear river and Marysville, to see for themselves what the debris had done. They also visited the site of the proposed Yuba dam, which State Engineer Hall suggests as a good spot to hold back the heavier detritus, while the lighter can be held in solution and carried away by the river into the ocean. This spot is at the mouth of a gulch about a mile wide, a short distance below Smartsville. The dam proposed will be about 200 feet wide, and on the east lies a quarry from which the rock can be taken to build it. He proposes to make the dam 10 feet high at this point, and as from the mouth of the gulch to the scene of the mining the slope of the fall is 1 foot to 10, the dam would push back the debris over the whole area behind it. The bed of the dam would be made on the soft soil, and, therefore, the danger of its breaking away in case of a flood, as suggested by some members, and coming down with all its accumulations, would be very imminent. Mr. Hall, however, believes that it can be made secure, and intends, as soon as the debris reaches the top of the dam, to put on 10 feet more, thus making it 20 feet high. The whole work, however, would be in the nature of an experiment, and might succeed and might not.

On Tuesday, in the Assembly, Felton introduced a joint resolution to petition Congress to enact a law whereby all mineral patents should contain an inhibition for hydraulic miners, regarding the washing of debris upon the lowlands. Fox moved an amendment, "unless they shall agree not to run their debris into the rivers and valleys." Carr, of Yuba, opposed the resolution, as it was interfering with the business of one of the chief industries of the State. Felton retorted by disclaiming any intention to harm the miners, and he knew it would not, but would, on the other hand, be of considerable benefit to the farmers. It would merely prevent the repetition of the struggle now pending between these interests. After several motions to refer to several committees were made and lost, the House rejected the resolution by a tie vote.

The discussion on Young's substitute for the drainage bills was resumed, and Brooks moved a substitute for Chandler's amendment to Section 20, fixing the tax upon each inch of water used by the miners at 1 cent, to make it ½%, which was adopted. After recess, the discussion resumed its original position in the shape of unsuccessful attempts to amend. Young, however, succeeded in getting an amendment to Section 21, requiring the State Engineer to make maps of all unreclaimed swamp and overflowed lands, and by striking out at the end of the section the clause, "and their decision shall be final," referring to the Board of Directors relative to the correcting of lists of such land liable to assessment for benefits derived by this bill. Chandler's amendments to Section 23, providing that the assessment upon land benefited shall be paid in six equal annual payments; also, that the owner of any 40-acre tract may pay at any time before final payment and be released; also,

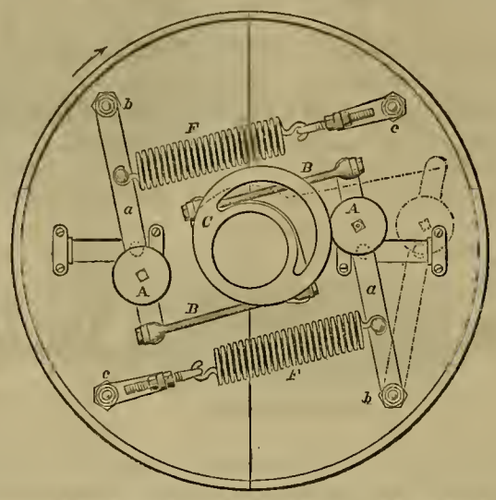


FIG. 3. THE BUCKEYE ENGINE CO.'S ISOCHRONAL REGULATOR. (See 1st page.

that the owner of one subdivision may not be held liable for the assessment on adjoining lands, were adopted. Section 25 was amended, on motion of Young, prohibiting the State Treasurer from paying out money except from the State Construction Fund or State Drainage Construction Fund, as provided in this bill, to exceed the amount of tax levy for the current year apportioned to that fund. Section 27 was amended, on motion of Carr of Sacramento, to prevent the condemnation of levees now built.

The consideration of the Young substitute for the Drainage bill was resumed on Tuesday, under the previous question which was ordered upon the same, when all the amendments to the bill were considered, except the substitute offered by Mr. Bennett. When it came up, as the last amendment for consideration, several members were desirous of speaking to the same, but were cut off by the previous question, much to their discomfiture. The substitute by Bennett was then voted down by a vote of 30 ayes to 44 noes. The original bill having been printed as amended was then ordered to be read for final passage. Numerous attempts were made to explain votes, etc., but were ruled out of order. The Speaker deciding that the previous question as ordered on the whole bill extended to the final roll-call, much dissatisfaction was expressed at this ruling, but the Speaker in support of his ruling produced authorities which substantiated his decision. Several attempts to appeal were made, but after the Speaker had stated the question in the plain manner in which he did the appeals were withdrawn, and the bill was passed by a vote of 44 to 35, Camron changing his vote for the purpose of moving a reconsideration, of which he gave notice.

The Tuttle-Brannhart bill "to encourage the mining industries and suppress stock gambling," has again evoked considerable discussion.

Braunhart moved an amendment to Section 5, to provide for the approval of bonds given by mining corporations, binding them to adhere to the provisions of this act, by the Superior Judges. Adopted. Tyler moved to amend

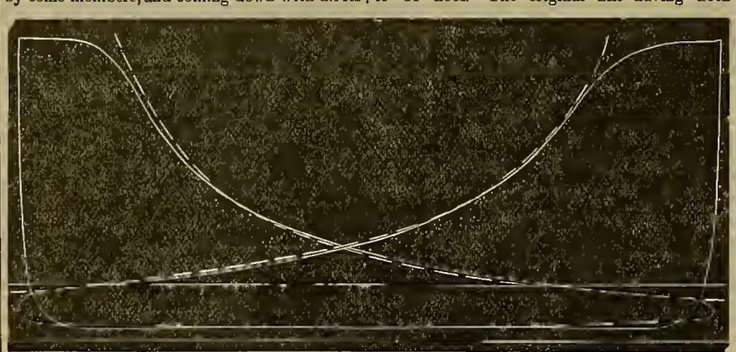

FIG. 4. INDICATOR DIAGRAM FROM BUCKEYE ENGINE. (See 1st page.)

subdivision 2 of Section 6, by striking out "weekly" and inserting "monthly"—to compel filing of statements monthly instead of weekly. Lost.

On motion of Fox the word "statuts" was inserted in subdivision 1 of Section 6. The amendment is to compel the filing of a certificate of incorporation with the Secretary of State when formed under a charter, deed of settlement, statute, or other document under which they are organized, etc.

Fox moved to strike out subdivision 2, which compels each corporation to file a weekly report with the Mining Commissioner, claiming that weekly is too often. He thought monthly would be better, as it would be impossible to comply with this provision. Braunhart objected, claiming that these reports are received daily by the head men of these corporations, and they could submit a weekly report without any more trouble than a monthly statement. The object is to compel them to submit truthful reports and not have a month in which to "doctor" them up.

Tyler said it would take a man twenty-four hours to prepare these reports, and then he would have to do it so rapidly as to not give it due consideration. He said the bill was to "cinch" somebody, which seems to suit a certain class. He then moved to reconsider the vote by which his amendment to subdivision 2 of section 6, to provide for the filing of statements monthly instead of weekly, was lost. Carried. Braunhart moved to amend the amendment by compelling them to file their statements semi-monthly.

Tyler claimed that monthly was enough. He favored holding these corporations to the strict letter of the law, but did not wish to impose a provision which it is utterly impossible to comply with. Braunhart's substitute for Tyler's amendment was lost, and Tyler's amendment was adopted. By consent the word "month" was inserted in the place of "week" wherever it occurs in the subdivision, to make it conform with the amendment adopted.

After a good deal of amending the House sent the bill finally to a committee consisting of Hartson, Braunhart and Fox, for revision. Its friends desired this action and its enemies did not object, because the delay will put the bill back a few days and imperil its final passage. The committee have prepared a number of amendments. Three of the latter sections are struck out, all of which relate to the publication of mining notices, and the perquisites of the Mining Commissioners are cut down fully one-half. The bonds to be given by the trustees and directors of mining companies for compliance with the act have been reduced from $20,000 to $10,000, and other changes are made.

The amendments proposed by the Select Committee were, with one or two changes, adopted without discussion. The percentum in Section 18, recommended by the committee, was reduced from one-tenth to one-twentieth of one per cent. and adopted as the amount to be charged by every member of the Stock Board to the buyer or seller, and the broker is required to pay this amount over to the Mining Commissioner. The only change in the section is the amount of percentum to be charged. The committee's amendment to Section 23, Subdivision 2, reduced the filing fee from $10 to $2. The House amended this by making it $1 instead of $2. The committee's amendment to Section 26 fixed the salary of the Secretary at $2,400, and that of the Assistant Secretary at $1,800. These amounts were reduced, the former to $1,800 and the latter to $1,600. Section 13 was, on motion of Nelson, amended so as to allow stockholders to be pecuniarily interested in any contract by a two-thirds vote of the stockholders, to be decided at a regular stockholders' meeting and entered upon the minutes. Nelson claimed that this was necessary, as a great many small mines are compelled to be run entirely by the stockholders. The amendment was agreed too and unanimously adopted. The other committee amendments, which are trivial, were then adopted; also the amendment striking out Sections 31, 32 and 33. The bill was then placed at the bottom of the third reading-files, which will make it No. 76 on the file.

The enacting clause has been stricken from Senate Bill No. 203 by the Senate. The bill provides that assessments and calls should not be made unless by a majority vote of the stockholders, and prohibited voting by proxy or trustee. The discussion held both the morning and afternoon sessions. Sears poured out unstinted abuse on the bill, while Enos advocated it. It was amended in the proxy and trustee clause and other respects. The motion to strike out the enacting clause was carried by a vote of 17 to 10.

The Senate on Wednesday passed, by a vote of 26 ayes to 8 noes, Nye's Mechanics' Lien Bill. It secures absolutely to laborers and material men their just dues. Hittell has given notice of reconsideration.

The Union Pacific is now receiving steel rails from three rolling mills, which are kept at work all the time to supply the company. These steel rails are being used on the main line as fast as they are received, and the iron rails are taken up and laid down on the branches. The iron rails that are in bad condition are sent to the Laramie Rolling Mills to be rerolled.

THE Southern Pacific Railroad track is laid 14½ miles east of Tucson, A. T.

RULE for finding the pressure per square inch on safety valves, when the area of the valve, weight of the ball, etc., are known: Multiply the weight of the hall by the length of the lever, and then multiply the weight of the lever hy one-half its length; then multiply the weight of the valve and stem by their distance from the fulcrum; add these three products together; this sum, divided by the product of the area of the valve, and its distance from the fulcrum, will give the pressure in pounds per square inch.

INK FOR WRITING ON TIN PLATE.—The following is a German recipe: Dissolve one gram of sulphate of copper with two drops of muriatic acid in 20 grams of water, and add mucilage of gum arahic in sufficient quantity. This ink gives a permanent deep hlack stain on tin. The addition of some pyrogallic acid has the advantage of causing the writing to he immediately apparent, that is to say, while the writing is performed.

A NEW mining camn has been started in southwestern Colorado, on the Rahhit-Ear Range, in Grand county. Ore that will average from 100 to 1,200 ounces in silver has heen taken from several of the partially dcveloped mines. One mine, the Grand Lake, produced ore that assayed 3,000 ounces of silver to the ton.

THE bonanza of Upper Oak creek, Fremont county, Col., is the Terrihle mine. It has heen developed into a mammoth vein of crystallized lead 100 feet in width. The crystallized lead runs: Best, 85%; poorest, 15%; whole lead average, 50%. It is reported that 50 tons of ore per day are takeu out with a very small force of men.

JOHN JULIAN, of Duhuque, Iowa, has devised a machine for enlarging the lower or inner end of holes for blasting purposes, so as to admit of a charge of powder being placed at one point.

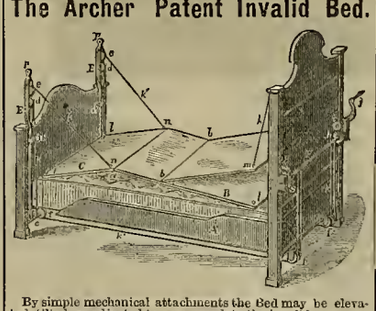
DEWEY & CO.'S
Scientific Press Patent Agency.
[ESTABLISHED 1860.]
Inventors on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far hayond those which can he offered home inventors hy other Agencies. The informatiou accumulated through long and careful practice hefors the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentahility of inventions brought hefore us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 202 Sansome St., S. F.
A. T. DEWEY. W. B. EWER. GEO. H. STRONG.

Sanderson Bros. & Co.'s
BEST REFINED CAST-STEEL,
WARRANTED MOST SUPERIOR FOR DRILLS, HAMMERS, ETC.
A full and complete stock of this reliable and well-known brand of Steel, for mining and other uses, now in stock, and for sale at
21 and 23 Fremont Street, S. F., - H. D. Morris, Agent.

Dixon's Graphite Axle Grease.
Will neither run nor gum. It will last three times as long as any other grease. It is the BEST LUBRICATOR for all MILL MACHINERY.
It is extensively used in this city, being the cheapest and the best. ☞Try it, and you will use no other.
WARREN HOLT, Sole Agent for this Coast,
No. 717 Montgomery Street, San Francisco.

The Archer Patent Invalid Bed.


By simple mechanical attachments the Bed may be elevated, tilted, or adjusted to accommodate the invalid.
For full particulars see MINING AND SCIENTIFIC PRESS December 27th, 1879.
The adjustable bed bottom is put on top of the mattress, and by means of noiselessly operating cords and pulleys the patient may be put in any desired position.
The bed is adapted for persons in good health who wish an easy position, as well as it is for invalids.
This bed is of the latest improved form, with a view to simplicity, convenience and ease to the occupant.
A limited number of State and County Rights for sale.
Orders for the Patent Bed can he filled immediately.
Satisfaction will he given to those desiring to interest themselves in the manufacture or sale of this article.

(Elevator, No. 10 Leidesdorff street.)

Ingersoll Rock Drills.

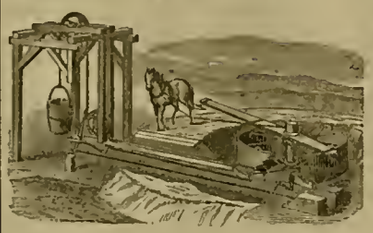
In use in the largest and best Mines of the Coast.

HAS AUTOMATIC FEED.

Has less Repairs.

Is Lighter and more Easily Adjusted than any other Drill.

Our DRY AIR COMPRESSORS are the most Economical Compressors in the Market.



MINERS' HORSE-POWER.

This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.
The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

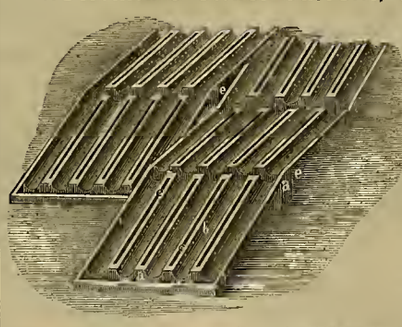
Howland's Under-current, Mill and Sluice Riffle.



This invention meets a want which has long been felt by Gravel Miners and Millmen, viz.: that of a simple, cheap Riffle which will save the largest possible amount of gold or sulphurets with the least possible waste of quicksilver. That this Riffle answers all these conditions will be apparent to any practical man who takes the trouble to examine it. The arrangement of this Riffle is such that there is a strong, unobstructed upper-current to carry off and break up the gravel or cement, and a slow under-current, checked by numerous riffles, which give gold or sulphurets a better opportunity of settling than if they were exposed to the force of the main current.

In this Riffle there are cast troughs for the quicksilver, which extend entirely across the sluice, and while they are so placed that the current will naturally pitch towards them, and give every opportunity for amalgamation, the quicksilver is fully protected from flouring or leakage. There is no mechanical skill required in taking out or replacing the sections.

Full particulars in regard to this invention can be obtained by applying to

STEIGER & KERR, of the Occidental Foundry, 137 First St., S. F.,

Who have the sole right of manufacturing this Riffle, and who will receive and attend to all orders.

GEO. S. LADD, President. ANDREW WHITE, Secretary.

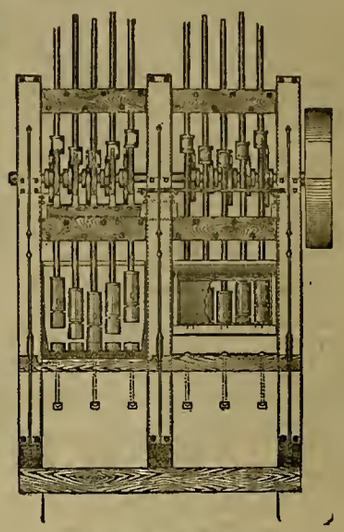
Machinery.

GOLD AND SILVER
Grinding and Amalgamating
MACHINERY.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies.



SPERRY'S
Wrought-Iron Frame
FOR STAMP MILLS.

Great saving in time and money over the wood frame. Is made complete with wrought-iron frame ready to put upon the foundation, requiring no skilled millwright. These mills are unsurpassed in excellence in every particular.
We are furnishing all the Machinery for a 10-Stamp Gold Mill, including Crucible, Steel Shoes and Dies, Boiler and Engine, Counter Shafting, Pulleys, etc., Stamps weighing 450 lbs. each, with Copper Plate inside of the Mortars, and for tables outside, making all the Machinery complete for a 10-Stamp Mill for the sum of

$2,550.

We construct Mills with Stamps weighing from 350 to 900 lbs. for gold or Silver Ores. Wet or dry Crushing Mortars. Will contract to erect complete Gold and Silver Mills on the most improved plans. We have 30 years' experience in mining and milling Gold and Silver Ores, and can compete with the world. Send for a circular. Address

A Card from Architects.

The California Architect and Building Review.

Office, No. 240 Montgomery Street, San Francisco, Cal.

It is with pleasure that we publish the following from prominent Architects in this city:
Believing that a journal of its kind is a necessity on this coast, and judging from what has appeared in the "Quarterly Architectural Review," we are led to believe that the CALIFORNIA ARCHITECT AND BUILDING REVIEW will be worthy of generous support and encouragement. We therefore pledge our cordial sympathies, personally, and hope that the enterprise will receive kindly recognition and liberal support from all Architects and Builders and the public generally. (Signed) David Farquharson, Wright & Sanders, S. H. Williams, Thos. J. Welsh, P. Huerne, John Marquis, B. McDougal & Son, Wm. Mooser, Wm. Curlett, Meeker & Banks, W. C. Hoagland, S. & J. Newsom, B. Henrickson.

HOW TO STOP THIS PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by *letter*.

The Chance for a New Industry.

On another page of this issue we publish an important article hy Hon. B. B. Redding, concerning the occurrence of shellac and lac-dye in the dcserts of southern California and Arizona. Mr. Redding shows clearly the wide extent of territory which is now covered hy deposits of this substance, and the analyses of it hy Mr. Stillman, of the California State University, estahlish its commercial value. Here tben we have proof of the plentiful existence of the material and its quality; the problem now arising is the turning of these discoveries to practical account hy lac gatherers. The statement of Mr. Redding shows that the Chinese authorities are already on the track of this new style of surface mining, and it is quite probahle that the Chinamen will soon he on the ground in pursuit of its profits. It remaius to he seen whether the hundreds of white men whose time hangs heavily on their hande will be brave enough to set out and secure fair returns for their lahor in gathering this material, or whother the Asiatic shall have it for his enterprise. Mr. Redding's paper shows amounts of shellac and lac-dye imported and consumed in this country; also, the market value of these substances at present. Of course if considerahle amounts should he put upon the markct the price would feel its influence, hut there would seem to he a good margin for profit still, and the price which might he paid for export would prevent the enterprise from heing wholly unproductive. Mr. Redding shows also hy what a simple process the crude material is given the marketahle form.

The specimens scnt us of the plant, and of the deposits upon it are very interesting. The ahundance of the substance is clearly shown. We shall he pleased to show the specimens to any one who may call at our editorial rooms.

News in Brief.

PRESIDENT ANOELL has accepted the Chinese mission.

THE population of St. Louis is now stated to be 540,000.

ELEVEN persons were recently massacred hy Indians in New Mexico.

CHARLES VIVIAN, the actor, died at Leadville, Col., on March 29th.

DR. S. B. BRINKERHOFF died suddenly at Santa Barhara on the 26th.

JACOB FREY cut his wife's throat and then his own at St. Louis, March 26th.

RUSSIA has given 6,000 francs for the relief of the refugees from Easteru Roumelia.

THE name of Rear Admiral Leroy has becn placed on the retired liet of the navy.

AT Mendocino, March 26th, two men were seriously injured by a hoiler explosion.

THE Czar of Russia recently shot and mortally wounded his confidential servant.

WILLIAM BARTOM, 16 years old, was hanged for murder recently, at St. Charles, Mo.

SITTING BULL's people, who dcsire to surrender, will only he received as prisoners of war.

THE Russian fleet in the Pacific is said to he greater than the fleets of all other nations comhined.

AT Winfield, Ks., recently, two huildings were carried away hy a cyclone and cannot he found.

VIOOROUS military steps are taken in New Mexico to punish Victorio's band of marauding Indians.

SATURDAY'S storm did great damage in central and southern Illinois, Missouri and eastern Indiana.

THE Ute Chiefs, with the exception of Douglass, who will he rctained a prisoner, have left Washington for Colorado.

SENATOR THURMAN was taken suddenly ill a few days since while speaking, and was ohliged to leave the Senate Chamher.

THE election in this city on March 30th passed off very quietly. Only a few arrests were made, none of them for disturbance at the polls.

THE Eureka Con. and K. K. Con. mining companies have became involved in a lawsuit at Eureka, Nev., over their respective claims.

THE hell punch has heen superseded on the Sutter street line in this city hy the ticket register, recently introduced on the Clay street line of cars.

While workmen were engaged digging a well near Birmingham, Ala., a sudden current of gas hegan to flow, aud immediately thereafter petroleum started, and is flowing at the rate of 90 barrels per day.

ON the 25th of February a Chilean force of 10,000 men landed at Ilonilo, Peru, six miles from Arica, where there was a Peruvian force of about 10,000, and the position of the latter was considered critical.

THE old steamer *Pelican*, which was sold to the Costa Ricans, has transferred all her guns to the steamer *Thomas A. Whitelaw*, and the former is expected here in about three weeks for repairs.

THERE are now on exhibition in this city two sea elephant pups. They were captured off the Mexican coast, about 700 miles south of this port, and are the property of J. T. Hayes. They now weigh about 800 pounds apiece, though only a few months old.

BLAIR PROCESS.—Can any of our readers send us the particulars of the Blair process for making iron, in use at Pittshurg?

Product of Enriqueta from 1860 to 1863, 10,571 flasks. Total product of all the mines on the Company's property, 637,363 flasks of 76½ pounds each, or 52,583,052 pounds.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

[From Official Reports for the "Mining and Scientific Press," Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

FOR THE WEEK ENDING MARCH 23, 1880.

225,741.—CAR TRUCK—W. T. Brown, Stockton, Cal.
225,753.—MIDDLINGS PURIFIER—T. D. Isbell, Ukiah, Cal.
225,838.—SHOE FOR GRAIN THRESHERS, ETC.—A. H. Johnson, Woodland, Cal.
225,756.—SNAP HOOK—F. Kortick, S. F.
225,759.—HARROW—P. H. Nelson, Haywood, Cal.
225,773—BALING PRESS—B. M Watts, Phœnix, Arizona.
225,776.—VALVE FOR SEWER TRAPS, ETC.—W. Wilson, Oakland, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

PORTABLE BALING PRESS.—Benjamin M. Watts, Los Angeles, Cal. Patented March 23, 1880. No. 225,773. This haling press is intended to be moved about the field from place to place where the hay lies as it has heen cut and raked, and there is no necessity of hringing the hay to the press or traneporting and stacking a quantity in one place so as to eave moving the press. This is the prime and paramount object of this invention, the peculiar combination and construction heing such that these results are ohtained hy the minimum of expenditure of time, lahor and money. This invention provides a horizontal press mounted on a wagon, to which the horses are always hitched while it is worked, and the hay in the field is baled and left in hales. These hales may then be hauled to the harn or elsewhere and stored, the product having, therefore, to he moved only once instead of twice, as when the hay ie first stacked in the field, then haled, and then moved in hales. In hilly and mountainous sections particularly, this press will he found very useful and convenient, although, of course, it may he used on any kind of ground.

MIDDLINGS PURIFIER.—Thomas D. Isbell, Ukiah, Cal. Patented March 23, 1880. No. 225,753. This device relates to certain improvements in middlings purifiers, and consists in certain peculiar arrangement of the draft openings and tuhes in a purifier, in which the material drops upon oppositely-inclined alternating shelves, hy which the lighter particles are separated from the heavier in a uniform and rapid manner.

SNAP-HOOK.—Frank Kortick, S. F. Patented March 23, 1880. No. 225,756. This invention relates to certain improvements in such snap-hooks as may he employed to connect various parts of a harness, and for any other purpose where it is necessary to have an easy means for connecting and disconnecting parts; and it consists in the formation of a hook having a spring latch-piece, which allows the link or other attachment to be easily connected with the hook or detached therefrom.

DRAFT REGULATOR FOR HARROWS.—Peter H. Nelson, Haywood, Cal. Patented March 23, 1880. No. 225,759. The object of this invention is to provide an arrangement hy which the point of draft on a harrow may he altered at will during the progress of the implement over the field. It consists of a transversely-sliding draft-har having a centrally-placed yoke or clevis, said har being connected with a lever reaching to the rear of the harrow, so that the driver, hy means of this lever, can shift the draft-har at will without stopping the horses. Suitahle arrangements are made for holding the lever, and hy it the draft-har, in any desired position. In rough or rolling ground this is specially advantageous, as it lessens the work of the tcam materially, avoiding frequent stoppages and startings.

Models and Patent Applications.

One of the burdons imposod by the Government on inventors, and which most other governments have dispensed with, is that of requiring a modol of the invention for which application for letters patent is made. The inventor must make a perfect model, in addition to the drawings, although he is not allowed to refer to the model in his specification describing the invention. He must confine his description to what is shown in the drawings. In fact half of the models sent are never really required hy the examiners, and they do not look at them. They pass upon the case by means of the drawings, and ignore the model. This heing an acknowledged fact, it seems as if the models might he dispensed with entirely, in most cases, which would he a great saving of expense to inventors. It very often costs an inventor more to make his model than all the other expenses of obtaining the patent.

We notice in the last report of the Commissioner of the Patent Office, that where he refers to the use of models in examining applications, he states that only about 50% of the models now sent are used, and he recommends the enactment of a statute to the effect that "no model shall be required or filed in any case, unless upon a written certificate, filed in the case hy the examiner in charge of the division to which the invention pertains, that it will he useful in the examination of the application, or upon the special order of the commission."

Useful Books.

SANTA MARIA, Feb. 29, 1880.

To Dewey & Co., S. F.:—GENTLEMEN:—The books I sent $3 for arrived in due time. I am very well pleased with them.

"Ropp's Easy Calculator" I have not examined much as yet, but I have seen enough of it to think it well worth the money paid for it.

To a mechanic "The 507 Mechanical Movements" is a valuable book. I had not looked at it five minutes before I got more than $1 worth of ideas that I can employ in my trade (carpenter) to a good advantage.

The "Rural Handbook" has received a more extended perusal than the other two, and I can unquestionably say that it is a perfect gem. *Me judice* it is *multum in parvo*.

M. D. MILLER.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct (or if the paper should ever come beyond the time desired), be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omissions of agents.

FRESH attractions are constantly added to Woodward's Gardens, among which is Prof. Gruber's great educator, the Zoographicon. Each department increases daily, and the Pavilion performances are more popular than ever. All new novelties find a place at this wonderful resort. Prices remain as usual.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription, and request that they circulate the copy sent.

EXTRA COPIES can usually be had of each issue of this paper, if ordered early. Price, 10 cents, postpaid.

Chew JACKSON'S BEST Sweet Navy Tobacco.

By Universal Accord,

AYER'S CATHARTIC PILLS are the best of all purgatives for family use. They are the product of long, laborious and successful chemical investigation, and their extensive use, by physicians in their practice, and by all civilized nations, proves them the best and most effectual purgative Pill that medical science can devise. Being purely vegetable no harm can arise from their use. In intrinsic value and curative powers no other Pills can be compared with them, and every person, knowing their virtues, will employ them, when needed. They keep the system in perfect order, and maintain in healthy action the whole machinery of life. Mild, searching and effectual, they are specially adapted to the needs of the digestive apparatus, derangements of which they prevent and cure, if timely taken. They are the best and safest physic to employ for children and weakened constitutions, where a mild but effectual cathartic is required.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Atlanta Mining Company.—Location of

principal place of business, San Francisco, California. Location of works, West Tintic Mining District, Juab County, Utah.

Notice is hereby given that at a meeting of the Board of Directors, held on the Second day of January, 1880, an assessment (No. 1) of Five Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, room 7, No. 420 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Fifth (5th) day of February, 1880, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Friday, the Twenty-Seventh (27th) day of February, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

A. F. MCGREW, Secretary.

Office—Room 7, No 420 Montgomery street, San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Thursday, February 26th, 1880, and the day of sale to Monday, the 22nd day of March, 1880. By order of the Board of Directors.

A. F MCGREW, Secretary.

Office—Room 7, No. 420 Montgomery street, San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Wednesday, the 17th day of March, 1880, and the day of sale to Saturday, the 10th day of April, 1880. By order of the Board of Directors.

A. F. MCGREW, Secretary.

Office—room 7, No. 420 Montgomery St., San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Friday, the ninth day of April, 1880, and the day of sale to Wednesday, the fifth day of May, 1880. By order of the Board of Directors.

A. F MCGREW, Secretary.

Office—Room 7, 420 Montgomery St., San Francisco, Cal.

Consolidated Pacific Mining Company.—

Location of principal place of business, San Francisco, California. Location of works, Bodie Mining District, Bodie, Mono County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the Thirteenth day of March, 1880, an assessment (No. 1), of One Dollar per share was levied upon the capital stock of the corporation, payable immediately in lawful money of the United States, to the Secretary, at the office of the Company, 330 Pine St., room 5, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Sixteenth day of April, 1880, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Saturday, the Eighth day of May, 1880, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Directors.

F. E. LUTY, Secretary.

Office—No. 330 Pine street, room 5, San Francisco, Cal.

Gover Mining and Milling Company.—

Location of principal place of business, San Francisco, California. Location of works, Amador County, near Drytown, California.

Notice is hereby given that at a meeting of the Directors held on the Eighth day of March, 1880, an assessment (No.

41) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, No. 402 Front street, room 8, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Twelfth day of April, 1880, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the Third day of May, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

W. O. WILSON, Secretary.

Office—402 Front street, room 8, San Francisco, California.

Rocky Point Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Placer County, California.

NOTICE.—There are delinquent upon the following described stock on account of assessment (No. 2) levied on the 14th day of January, 1880, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law, and an order of the Board of Directors, made on the 14th day of January, 1880, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the Company, 314 Bush street, San Francisco, on Thursday, the 11th day of March, 1880, at the hour of 1 o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

T. L. BIBBINS, Secretary.

Office—314 Bush street, San Francisco, California.

POSTPONEMENT.—By order of the Board of Directors, the above sale of delinquent stock of the Rocky Point Mining Company is postponed to Thursday, the 25th day of March, 1880, at 1 o'clock P. M.

T. L. BIBBINS, Secretary.

POSTPONEMENT.—By order of the Board of Directors, the above sale of delinquent stock of the Rocky Point Mining Company is postponed to Tuesday, the 20th day of April, 1880, at 1 o'clock P. M.

T. L. BIBBINS, Secretary.

ANNUAL MEETING.

NOTICE.—The Annual Meeting of the stockholders of the BRILLIANT MINING COMPANY, for the election of officers to serve for the ensuing year and for the transaction of such other business as may properly come before it, will be held on Wednesday, the 21st day of April, 1880, (third Wednesday in April), at 2 o'clock P. M., at the office of the Company, room 4, 309 California Street, San Francisco, California.

J. M. BUFFINGTON, Secretary.

Office—Room 4, No. 309 California Street, San Francisco, California.

A NEW BOOK.

A Treatise on the Horse and his Diseases.

By B. J. KENDALL, M. D.

35 Fine Engravings showing the positions and actions of sick horses. Gives the cause, symptoms and best treatment of diseases. Has a table giving the doses, effects and antidotes of all the principal medicines used for the horse, and a few pages on the action and uses of medicines.

Rules for telling the age of a horse, with a fine engraving showing the appearance of the teeth at each year.

It is printed on fine paper and has nearly 100 pages, 7½x5 inches. Price only 25 cents, or 5 for $1, on receipt of which we will send by mail to any address.

DEWEY & CO.,
202 Sansome St., S. F.

Kendall's Spavin Cure

Is a sure cure for spavin, splint, curb, callous, sprains, swellings, galls, lameness and all enlargements of the joints or limbs. It will completely remove a bone spavin without blistering or causing a sore. It is also as good for man as for beast, and is used full strength at all times of the year with perfect safety. A cure which we are knowing to is a person who suffered 15 years with hip-joint lameness and was permanently cured two years ago with Kendall's Spavin Cure. Remember we claim it will cure a bone spavin and completely remove the bunch without blistering.

Office U. S. Marshal, Western Dist. of Michigan, }
Kalamazoo, April 15th, 1879. }

B. J. Kendall, Enosburgh Falls, Vt.—DEAR SIR:—I received the two bottles of your spavin cure forwarded by express in January last. I am happy to state that it performed all your advertisement called for. In three weeks after I commenced using it the spavin was entirely removed and a valuable horse restored to usefulness. Very truly yours, JOHN PARKER.

Send for illustrated circular giving positive proof. Price, $1 All Druggists have it or can get it for you.

DR. B. J. KENDALL & Co., Prop's, Enosburgh Falls, Vt.
CRANE & BRIGHAM, Agents, San Francisco, Cal.

NOW READY!

OF IMMENSE PRACTICAL VALUE TO EVERY SAW USER.

GRIMSHAW on SAWS!

History, Development and Action; Classification and Comparison; Manufacture, Care and Use of SAWS of all kinds. Quarto. 234 Illustrations.

By ROBERT GRIMSHAW, Ph. D., M. E.,

Member of the Jury on Wood-working Machinery at Paris Exposition of 1878.

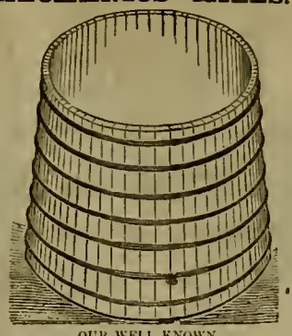
This thorough work, impartially written in a clear, simple and practical style, treats the Saw scientifically, analyzing its action and work, and describing, under the leading classes of Reciprocating and Continuous Acting Saws, the various kinds of large and small hand, sash, Mulay, jig, drag, circular, cylinder and band Saws, as now and formerly used for crosscutting, ripping, scroll-cutting, and all other sawing operations in wood, stone and metal, ice, ivory, etc., in this country and abroad. With appendices concerning the details of manufacture, setting, swaging, gumming, filing, etc., tables of gauges, log measurements from 10 to 24 feet, and from 12 to 96 inches, lists of all U. S. Patents on Saws from 1790 to 1880, and other valuable information. Elegantly printed on extra heavy paper, wide margin, copiously indexed.

Owing to an increase of nearly 100% in number of pages and illustrations since first projected, the price is this date made $2.50, postage paid

ROBERT GRIMSHAW,
624, 626 and 628 Market Street, Philadelphia.

March 10, 1880.

MECHANICS' MILLS.



OUR WELL KNOWN

WATER TANKS,

Made by machinery, constantly on hand and made to order. PAN STAVES, WOOD PULLIES and OAK GUIDES a specialty.

WELLS, RUSSELL & CO.,
Mechanics' Mills, corner Mission and Fremont street

Entirely different from other Saws. When dull, sharp teeth, which only cost a trifle, can be inserted in a few minutes, without taking the saw off of the mandrel, and no skill is required in doing it. Send for Catalogue showing their vast superiority. More of them are being sold than of any other kind, and we are altering all other kinds to the Chisel Tooth.

SILVER PLATED AMALGAMATING PLATES.

The best process yet discovered for saving fine or float gold. Extensively used with great success in gravel and quartz mining in various parts of the Pacific Coast. Over one thousand orders have been filled, and the demand is constantly increasing. Old Mining Plates bought or taken in exchange for new Silver Plated Plates. Gold extracted from old Plates at a moderate cost. Old Plates (which often contain a surplus of gold above the cost of plating) can be re-plated.

With the most extensive facilities on the Pacific Coast, orders can be filled very promptly and satisfaction guaranteed. All kinds of metal goods plated. Send for circular.

SAN FRANCISCO GOLD, SILVER, NICKEL AND COPPER PLATING WORKS,

Nos. 653 and 655 Mission Street, San Francisco, Cal.

EDWARD G. DENNISTON, - - - - - - - - - PROPRIETOR.

In consequence of spurious imitations of

LEA AND PERRINS' SAUCE,

which are calculated to deceive the Public, Lea and Perrins have adopted A NEW LABEL, bearing their Signature thus,

Lea & Perrins

which is placed on every bottle of WORCESTERSHIRE SAUCE, and without which none is genuine.

Ask for LEA & PERRINS' Sauce, and see Name on Wrapper, Label, Bottle and Stopper. Wholesale and for Export by the Proprietors, Worcester; Crosse and Blackwell, London, &c., &c.; and by Grocers and Oilmen throughout the World.

To be obtained of CROSS & CO., San Francisco.

SHEET IRON PIPE.

FRANCIS SMITH & CO.,

Manufacturers of

THE PATENT CHANNEL IRON WHEELBARROWS.

THE STRONGEST BARROW MADE. These Barrows are made by Superior Workmen, and of the best material. All sizes kept constantly on hand.

SHEET IRON PIPE.

Lap-Welded Pipe, all Sizes, from Three to Six Inches. Artesian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.

Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.

Office and Manufactory, 130 Beale Street, San Francisco.

SHEET IRON PIPE.

STEEL CASTINGS

FROM 1-4 TO 10,000 lbs. WEIGHT.

True to pattern, sound and solid, of unequaled strength, toughness and durability.

An invaluable substitute for forgings or cast-iron requiring three-fold strength.

Gearing of all kinds, Shoes, Dies, Hammerheads, Crossheads for Locomotives, etc.

12,000 Crank Shafts of this Steel now running proved superior to wrought iron.

CRANK SHAFTS, CROSSHEADS and GEARING, specialties.

Circulars and Price Lists free. Address

CHESTER STEEL CASTINGS CO.

(Formerly McHaffie Direct Steel Castings Co.)

Works, CHESTER, Pa. 407 Library St., PHILADELPHIA

Rotary Pulverizer,

(WHITE'S IMPROVED,)

For Disintegrating Ores and Other Substances.

GUARANTEED TO BE EQUAL IN CAPACITY TO A

HUNDRED STAMP BATTERY!

IS FITTED UP WITH

Homogeneous Steel Beater Bars.

Found to be more durable than either Hard Steel or Soft Iron. Dry-crushing the hardest rock; will last for months, and without the slightest danger of breakage.

The Pulverizer requires about one-third the power usually expended for the reduction of the same amount of Ore by Stamps.

Price List, Etc., of the White Rotary Pulverizer.

No.	Tons Per Hour.	Inches Diameter.	Revolutions Per Minute.	Horse Power Required.	Shipping Weight.	Lumber Required.	Price.
1	6	56	600	40	12	6,000 ft.	$5,000
2	10	72	470	60	15	9,000 "	8,000
3	16	84	400	75	20	12,000 "	10,000

The Repairs on the Pulverizer will not exceed those of a 10-Stamp Battery.

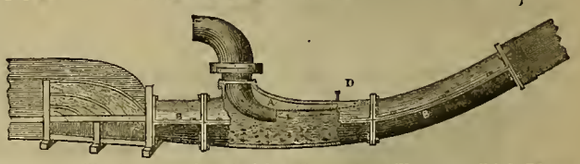
The Shipping Weight of the entire apparatus is not one-eighth of that of Stamp-Mortars required to do an equal amount of work. It can be placed and put running at the Mill in from fifteen to twenty days.

Address GEO. W. WHITE, Inventor.

Manufactured exclusively at the ÆTNA IRON WORKS, 217 Fremont St.

San Francisco, Cal., January 1st, 1880.

HYDRAULIC GRAVEL ELEVATORS,



For working flat gravel mines that have no dump.

Sluices gravel and water up hill on an angle of 45°, and will run any kind of gravel that will run in a flume. Handles rocks as easy as fine dirt, and will raise as much material as the water will carry off in a flume on 6 inches grade to 12 feet.

No bedrock cuts, tunnels or drains required. Machine a sufficient drain itself, and the process of mining the same as any other hydraulic mine. Is now a practical success in various places in California and Oregon. Send for descriptive circular to

JOSHUA HENDY,

No. 51 Fremont Street, Office of the Hydraulic Gravel Elevating Mining Co., S. F.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, APRIL 10, 1880.

VOLUME XL Number 15.

The Mining Season.

With the return of warm weather tho past week, every hranch of mining has been favorahly affocted, the hydraulic minore, for the first time the preeent eeason, having generally got to work. In a few localities the ditchoe etill remain somewhat obstructed with snow and ice, hnt even theee will in a very short time be clear of theso obstaclcs, and the hydraulic mince overywhere havo entered upon what promisos to be one of the moet prosperons yeare ever experienced in the hietory of this busineee. After such a long and rigorone winter, the warm weather that has at last eet in ie not likely to suffer further interruption, while tho water snpply ie almoet eure to be ample and prolonged to a later period than nenal in tho snmmer. While so mnch delay in getting to work has caueed serione disappointment to thoee engaged in thie line of mining, the promieing ontlook has kept alive confidence in the busineee, which has attracted to it more capital the past year than ever before.

In the department of quartz mining, an unwonted degree of activity is noticeable all over the Stato. Some minee have been sold, while others are being negotiated for in the Eaet—a good deal of home capital heing also inveeted in thie claes of propertiee. In almost every qnartz district, from Siekiyou to San Diego, an unsual amount of proepecting work is heing dono, while in very many of them new mills and hoieting worke will the coming snmmer be put up. What hae served to impart an additional stimulus to thie branch of mining ie the cheapnese with which we are now—through improvements made in machinery, advantagee of climate, etc.,—enabled to extract and rednce this class of oree in California, the cost in some localitiee not exceeding $2.50 per ton. Labor here is aleo becoming not only cheap, but more steady and reliable than in daye gone hy. The region of more active quartz mining in this State extende now from Plumas, south, through all the intervening counties into Freeno, and even ae far eouth ae Tulare and Kcrn countiee.

Drift operations, which have not heretofore figured prominently in the mining industriee of California, are growing apace, the old long-worked claims having yielded with their accustomed fullnese, while many new and promieing enterpriece have been eet on foot of late. In seme of the drift ground recently opened impertant developmente have already been made, while in othere, big etrikee are euppoeed to be impending. On the North Fork of Feather river, at Hepsidam and Foreet City, in Sierra county, at Chalk Bluff and Liherty Hill, in Nevada county, and at Damaecne, Yankee Jims and about Foreet Hill, Placer county, are to be found the moet lively and proeperoue drift campe in the country. Preparations are heing made for extensive wing-damming on Scott'e river, along the Trinity, on the North Fork of Feather river and on the variove other streame, that offer inducemente for thie class of operatione.

ACADEMY OF SCIENCES.—The regular meeting of the California Academy of Sciencee was held on Monday evening last, Prof. Davidson in the chair. A large number of donatione were made to the collections, inclnding two bottles of oil from the Port Orford cedar. This oil ie obtained by burning the wood. It poseeesee powerful medicinal propertiee. B. B. Redding exhibited a very artietically conetructed fishing fly, manufacturod and used by the Indians. The Indiane, he eaid, will beat ue in fishing. By the same gentleman, twigs of the *Larrea Mexicana*, with the lac ineect imbedded, were ehown. Theee he had procured from Arizona since Prof. Stillman read a paper on the subject. He expreseed a doubt about there being a eufficient quantity to make the extraction of the shellac and lac-dye a profitahle indnetry, though the proces ie very simple. It ie found on the Mohave deeert, near Fort Yuma, but ie reetricted in ite habitat. Prof. Davideon made eome very intereeting remarks upon the enbject, "Why will the contraction theory account for preservation of the heat of the eun."

Rise in the Price of Quicksilver.

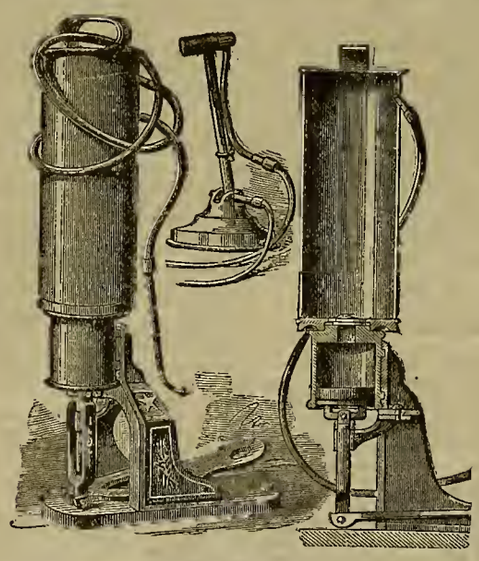
Several of our leading quicksilver mines have ehut down—owing to extraneoue causes, not from any failnre in their ability to yield an average or perhaps an increaeing output. They attribute the caneo to the legislative restrictions which, they aver, have been to a certain extent inflicted upon the free development of mining properties of this clase. The natural effect of thie closing movement was a reduction in the eupply, which was eoon followed by an advance in price as the demand increased over it. Had the effect ceased at this etage of the matter, it would not have gone beyond the ephere of mercantile tranеactions. It would merely have been an advance in the market value of an article. But when it ie coneidered that in the gold mining manipulations, and in many of the eilver milling proceesee, quickeilver ie an indiepeneahle factor in tho problem of euccees, it can readily be perceived that a eudden advance of 10% in ite cost would make a material inroad upon the profite of the mining for those two metals. It could he borne by the minere, if it did not advance still higher; but the proepective advance to etronger figuree dampened their ardor and depreeeed their hopes. Every department of our mining industry ehould he nourished and euetained. All salutary legislation is commendable toward any induetry; but when a decided antagoniem is evinced toward one of the moet important and productive of these induetriee, it cannot be continued without producing, ae in the caee in point, a direct as well as coneequential injury. Onr own market is not the only one to note the change in the production of quickeilver—it has made a material advance in the London market as well. So intimately connected are the markete of tho world, that the slightest dieturbance in any one of them is immediately experienced in all the othere, no matter how dietant they may be. The general revival of trade and commerce—which hae produced an increase of pricee in many of the leading articles of coneumption in induetrial channele—may have aided in the appreciation of the value of quicksilver. Such would be the natural effect of what is termed a "boom" in the metal market.

SERIOUS chargee have been preferred at Waehington against Judge Charles Silent, of the Supreme Court of Arizona.

THE Judge who aeeaulted ex-Secretary Delano has been eentenced at Washington to 30 days in jail and a fine of $1,000.

That Mining Bill.

Congrees is still "tinkering" witb the mining lawe, but it ie hardly probably that any of the radical changee propoeed will be made without more matnre consideration than there is time to give this seseion. We notice that the House Committee on Mines and Mining bave reported a snbetitnte for that portion of the Public Land Commieeioner's bill whicb relatee to the mineral lands. The principal changee made by the committee are as followe: The new bill allowe locators to hold their claime one year before diecovering mineral depoeite, and gives them three yeare to apply for patents. No pereon will be allowed to take up a second claim until he ehall either have etruck minorale in hie firet location or elee have abandoned it. The object of this provieo is, of conree, to prevent the wholeeale absorption of mineral lands. The new bill providee that conteets ae to priority of location, etc., ehall be eettled by the court, as at preeent. The committee fix the price of mineral lande at $2.50 per acre inetead of $5, as now charged, and they fill the hlank concerning the area locatable by any one pereon or aeeociation by making the maximum a sqnare of 990 feet, or ite equivalent, in any rectangular ehape, provided that neither dimeneion ehall exceed 1,500 feet. The committee have not yet taken formal action upon this hill, and their object in reporting it ie to have it printed, eo that copies may be mailed to all the mining States and Territoriee and elicit detailed commente, suggeetione and general expreeeione of opinion from all pereone interested. The committee will take no further action in regard to the suhject until they ehall thue have afforded the Western people full opportunity to examine and discuee the whole meaeure.



BURGESS' PATENT PORTABLE MECHANICAL BLOWPIPE.

Thie being the caee, we invite discueeion on the eubject from those who have given the matter any careful thought. The more thoroughly all the hearings of the queetion are diecueeed, the more likely we will he to get a good law, if the present one ie to be changed. We have received eome communications on the subject, which will be published next week.

THE much needed rain hae at length fallen in eufficient quantitiee to remove the enow and ice blockage, which has exieted to a greater or leee extent since about Christmae. Conseqnently, np to this time there has been but little mining done at euch mining camps as proeure their water from high altitudoe. The mines depending on water will, therefore, soon be ruehing with work.

An Improved Blowpipe.

The annexed engraving repreeents a compact, eimple and efficient device for maintaining a continuoue eupply of air under light or heavy preesure for blowpipe uee. The advantages of an invention of this character will be readily admitted by any one having had experience with the ordinary mouth blowpipe, as it not only eavee a great amount of hard labor, bnt it delivore a eteadier aud etronger blast than it is poeeible to maintain with the mouth, and it also enablee the operator to get a better view of his work, and permite of greater freedom in the uee of the hands.

The general appearance of the blowpipe ie ehown in Fig. 1, and ite internal conetruction will be readily underetood by referring to Fig. 2, which ie a central vertical eection. The pump cylinder ie mounted on an arched etandard, and containe a pieton having a valve opening upward. This pieton ie connected with the foot pedal hy a forked connecting rod, and ie moved by a slight and eaey motion of the foot. The upper end of the pump cylinder is closed, with the exception of a valve apertnre, which ie covered hy a valve, opening npward into a cylindrical air reeervoir secured to the upper end of the pump. Near the top of the air reservoir there ie a nipple, to which ie attached a flexible tnbe communicating with the blowpipe.

The mannfacturere furnieh either the ordinary blowpipe or the compound blowpipe, represented by Fig. 3. The machine is light and portahle, weighing bnt 12 pounds and measuring 24 inchee in hight. The pump cylinder is 2½ inchee in diameter with 3-inch etroke.

Thie device will be invaluahle to a large clase of artieans and especially nseful to dentiete, jewelere, chemists, aesayere, metal workers, minere and others who deeire a strong eteady hlast for reducing, fusing, eoldering, etc. It may be ueed to advantage in connection with the small melting furnacee now eo largely in nee. It is aleo of great utility to machiniete and steam, water, and gaspipe fittere in making alteratione and repaire, as it admite of the local application of a etrong heat, and thue obviatee the necessity of removing the parte. The blowpipe may be ueed effectively in connection with a gae, alcohol or oil flame.

The pipe outlet is much emaller than in the mouth blowpipe, to permit of maintaining a preesure. The air chamber is easily filled, and when charged affords a constant enpply of pure air. It ie claimed hy the manufacturere of this blowpipe that the pump poeseeeee many advantagee over the bellowe, ae a pressure of many pounde ie readily eustained with but little exertion. Further particulare may be obtained from J. Elliott Shaw, No. 154 South Fourth etreet, Philadelphia, Penn.

Flume Lining Blocks vs. Railroad Iron.

Blocke are very expeneive, and as a meane of eaving gold are far inferior to railroad iron. The following is the reeult of an experiment tried at Iowa Hill, with blocke and railroad iron nearly three years ago.

About 300 feet from the bank tho flume was divided into three eectione of about 65 feet eaoh. The first eection wae paved with blocke; the eecond, old iron raila; third, blocke. The iron rails caught nine ouncee more gold than the two other sections combined.

There are no data to show which ie the better lining, iron or etones. In the absence of euch data, however, stones are coneidered far preferable to blocks, and possibly eqnal, or even euperior to railroad iron. The principal objection to hlocke ie the great wear, thus, ae the blocke wear down, frequently cauеing the amalgam to wash out and eeek a lodgment eomewhere elee. Will eome person having a practical knowledge on the eubject complete the experiment hy giving us the comparative value of railroad iron and stonee for lining flumes.

SEVERAL thoueand men in the building trade at Liverpool have struck against a reduction in their wagee.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds

Letter from Southeastern Idaho.

The Caribou Gold Minee.

Editors Press:—Thinking you might liks to hsar something from this distant and isolated section of country, I forward you a few such iteme of information and news as seem to me most likely to prove of interest to your readers. And, first, a word or two touching the early history of this district, its geographical position, routee of approach, facilities for ingrese and egress, hyperhorean winters, etc., etc. The earliest discovery of gold iu this part of Idaho took place duxing the first Snake River excitement, which occurred some eight or nine yeare ago, having been made hy parties prospecting for placers on the upper waters and various tributaries of that stream. As theee parties were in search of ten-dollar diggings, they passed by the placere here, which, worked by band eluicing, the ouly method employed by them, would hardly pay such wages. After an interval of eix or eeven years, during which ecarcely any whites visited this region, a few adventurous prospectore comiug in began to work the placers in a small way, examining, at tbe eame time, the gold-bearing quartz lodes, which here so abound that they at once arrested their attention. Finding these lodes to be not only numerous, but large and exceedingly rich, tbese prospectore proceeded to make locations, and news of the discovery spreading abroad, a considerable population was lest year drawn into this neighhorhood.

Location, Means of Approach, Etc.

Tbe Carihou district, which derivee its name from a high mountain in the Snake River range, is eituated in Oneida county, which occupies the extreme southeastern angle of Idaho Territory. Centrally coneidered, the district lies nearly 100 miles in an easterly direction from Oxford, nearest station on the Utah & Northern railroad, with which point it will eoon be connected by means of a good wagon road, now partially completed. The country being elevated and mountainous ie naturally difficult of approach, and has a rigorous winter climate, the roads for the past three months having been most of the time impassable to teams by reason of the deep snow. They are now again open, and travel over them having been reeumed, will not again be interrupted before next winter, and probably not tben, as business will by tbat time have been so increased as to warrant effective meane being taken to keep tbem conetantly open.

Gulch and Hill Digginge.

Wbile there is a good deal of placer mining being done here, tbie business hae already become secondary to the quartz intereet, which latter must soon render Caribou conspicuous, even in a country famed for its great mineral wealth. The ground for several miles around Iowa Bar (principal center of the placere), has been pretty thoroughly prospected, and about all considered worth locating taken up. We have here both hill and gulcb diggings—tbe latter worked by band and ground sluicing, and the former by hydraulicing, at which there will be a good deal done the coming summer, as a number of ditcbes for bringing water on this class of claime have been completed, with the prospect of others being built this season. These ditches are ehort, from two to four milee long, and of moderate capacity, the quantity of water that can here he easily commanded being rather limited. With longer ditches, bowever, euch as will ultimately be constructed, almost any amount of water could be obtained. As yet, hydraulicing has been carried on bere in only a small way—that is, small compared witb the scale on which this branch of mining is conducted in your State. We have, however, the gravel deposits, and will eome day, when capital comes to onr aid, attack them more after the manner of California. Meantime, a good many miners will find profitable employment wasbing, hy the present lese effective methods the gold-bearing deposite here distrihuted over a considerable area of country. The product of onr placers amounted last year to $220,000—a sum that will probably be doubled this year. It is, however, in her

Auriferoue Quartz Lodes,

That the great and lasting wealth of Carihou reste, and which in the course of a very few years must distinguish this district for its large and profitable gold production. While these lodes are not scattered over such a vast area as in Dakota and California, they are quite as large as any found in either of these countries, the ore here being of a much higher grade than occurs in Dakota, and higher even than the average in California. While some little work has been done on several other ledges, the following comprises a liet of the more extensively developed and promising mines in the district.

On the Robinson Seriee of Locations,

Lying on the northerly slope of Carihou mountain and centrally on the great mineral belt that traverses the country in a eoutheasterly and northwesterly direction, a main shaft has been sunk and connected at its bottom by an incline run 220 feet from the point of location, ths whole being in first-class ore, of which there is now more than 1,000 tons on the dump, with several thonsand tons in sight. This ledge is over 20 feet wide, and shows a vast outcrop of quartz extending without a hreak for 1,100 feet. The work here is bsing done by contract, the ore extracted in the course of exploration more than defraying current expenses. A 40-stamp mill will he put up on this mine as soon as the road will admit of its being freighted in this spring. This, in connection with several other valuable properties lying near it, is owned hy Messrs. Rohinson, Farran & Tiernan, all men of means and experienced quartz miners. The Nahoh and Petereon locations, adjoining the above and being explored in much the same manner, are both making sucb satisfactory exhihits of ore as eerve to already establish for them a great prospective value. The Oneida, the first and one of the hest claims taken up in the district, ie beiug opened hy a tunnel driven on the course of the vein, now in several hundred feet and all the way in the rich tractahle ore characteristic of the country. Theee claims are all located on the northerly face of the monntain. On the eouth eide are the Northern Light, Silver Star, Orphan Boy, Paymaster and Virginia, displaying, under a considerahle amount of exploration, the same evidences of large and permanent wealth, the ahove propertiee insuring for Carihou a rapid development and prosperous future, were there no otber mineral deposits of value in the district.

The Ledgee and Oree.

Here are all that the most captious quartz miner or exacting capitalist could require, the former being of great eize, ranging from 20 to 30 feet in thickness, well walled, regular aud compact, while the ores, a free gold-bearing quartz, carrying from $25 to $60 to the ton fill the fissures they occupy from side to eide, and from the very surface to the lowest points to which they have yet been exposed. With lodes so large and well etocked we have here an abundance of water and timber, insuring always cheap ore extraction and reduction, as well as the meane for protecting ourselves against the cold weather that here prevails for three or four months in the year. In addition to our mineral resources we have in this part of Idabo quite a good deal of

Farming and Grazing Land,

The former situate mostly in the following localities: Round valley crossed by the railroad, and which is to be irrigated by water from Cottonwood creek, a canal having already been projected for that purpose. Connecting with this on the north ie Cache valley, emaller in area, but very fertile and containing tbe two growing towns of Oxford and Clifton, the land here being all taken up by farmers and etock raisers. Port Neuf valley, near the source of the river of that name, is filled with cattle, there being here much excellent pasturage., Blackfoot valley is also noted for its fine grase, mucb etock being kept here and great quantities of hay put up every summer. Marsh valley contains much good land, but being within the limits of the Fort Hall Indian Reservation, is not open to settlers. Nearly all the land in these valleys can be irrigated from the numerous large streams that descend from the high mountains around them.

X. Y. Z.

Iowa Bar, March 30, 1880.

The Public Land Commission.—No. 3.

Editors Press:—The membere of this contemptible commission consist of Clarence King, Director of tbe Government Geological Survey, Gen. Williamson, Commissioner of the Land Office, Prof. J. W. Powell, A. T. Britton, a Washington lawyer, and Tbomas Donaldson, who once lived in Montana. If they possess any sympathy with the poor hard working miner or adventuroue prospector, they have failed to show it in the recommendations they make to Congress in regard to mining laws. The ridiculous propoeition the commission makee in reference to the sale of timber on Government lands, exemplifies in a etriking manner how thoroughly incapable it is to adviee any practical measure in Land Office business. It recommends that timber ehould be eold without title being given to tbe land it is growing upon.

All trees beyond eight inches in diameter are to be sold, all below that size to be reserved from eale. Now, any practical timberman knows that in felling a large tree many small treee are broken, or have to be cut out of the way of the loggers; is the purchaser of the larger logs to he prosecuted as a trespasser and tbief, if he destroye the reserved saplings growing in their vicinity? Then the commission proposes to sell grazing land, and issue patents for it, while reserving the minerals it contains. It is inclined to grant easments to the patentee, if mines are opened in bie land. In other words tbis wondrously wise commission, while proposing changes in onr really excellent mining law of 1872, because as is falsely alleged its requirements lead to costly litigation, is prepared to enact a law in respect to pasture lands that would inevitably involve the purchasers in similar evils.

Will Congress act on the recommendations of this commission of wild theoriste? A Congress that passed a mining law a few weeks ago, whicb enables a prospector to save $100 worth of assessment work by eimply remaining idle two days, is capable of passing almost any absurd law that is brought before it. Under tbe law refsrred to, a prospsctor who finds a lode on the 31st day of December, 1880, will, if he locates on that day, have to perform work upon it of the value of $100 hefors Decemher 31, 1881, but if he covsrs up his lode, and locates it on January 2, 1881, he will not ue required to do any work upon it until Decsmhar, 1882.

Having directed attention in your pages to the ohnoxious character of the mining legislation proposed by the Puhlic Land Commission, I havs only to say now, that it rests with miners themselvss, whethsr they are to hs saddled with the ohjectionahle laws alluded to. They ought to meet iu their various districts, and pass resolutione condemning the proposed changes. It is to he regretted that we have no fit representative of practical mining interests in Congress at the present time, hut a pressure might he brought on such representatives as we have, that would serve the end in view: the defeat of a bill which, if passed, will ruin mining prospectors, and paralyze the mining husiness of the country.

J. D. Emersley.

Dos Cabezas, Arizona, March 22d.

Mt. Lassen.

Editors Press:—If my abilitiee as a descriptive writer were not so slender, I would like to describe Mt. Lassen and the country round about there in your valuable and much appre ciated paper. Mt. Lassen is eituated near the old trail of the Fredonner pass over the Sierra mountains, and unquestionably the lowest of any of tbe six principal passes over these mountains. It is in north latitude 41° 15′, and from the report of the topographical surveyors tbat were up there moet of the time last summer, is 11,000 feet above the sea level, and near 1,000 higher than heretofore estimated. It lies iu the southeast corner of Shasta county, and three other counties corner near it—viz., Tehama, Plumes and Lassen. The country surrounding it is not well suited for agriculture, but in the valleys where the land can be irrigated I have raised the finest of timothy grass, potatoes and most of the hardy vegetables. It is surrounded by the finest forests of sugar pine, yellow pine, fir aud cedar, the latter growing to the extreme timber line, only one or two thousand feet from its snow-covered summit.

If it had beon your privilege, as it has been mine twice, to stand upon its proud summit you would pronounce it a magnificent mountain. Among its rugged rocke on its highest peak, he geodetic eurveyors built their stone house, where they could see a reflected light for a hundred miles, and could telegraph to and from their main camp beyond Reno, wbich they did when they wanted their men to break up camp there and move to Mt. Shasta.

Thie corner of Shasta can not only boast of this noted mountain, hut of four otheresurrounding it over a mile high, a half dozen that are between 4,000 and 5,000 feet or three-quarters of a mile high, with a waving eea of lakes, emaller mountains and hills in the distance, to be seen hy the beholder from this great natural obserватory. On its sides may ho seen many natural curiosities—hot sulphur springs and fresh water springs flowing from its rocks, and after running in their own channele a few rods, commingling and forming a tepid water—ahout right for a pleasant bath. There are very few indicatione of minerals, only traces of cinnibar and ashestos, the latter being found in almost all of the volcanic rocks you break on and around the mountain.

Prof. Carr, from Millville, who visited the mountain eome two years ago, said the rock containing asbestos is very mucb like the volcanic rock around Mount Vesuvius; it is almost as light as pumice etone, and can he hewn into any shape easily.

In my next letter, if you see proper to publish this, I will attempt a description of some of the numerous lakce surrounding this Lassen mountain.

Cottonwood, Cal.

Puff Balls for Food.

Editors Press:—Almoet every one is familiar with the common puff balls of our fields, and yet but few are aware that they constitute a choice and valuable article of food. A knowledge of the proper time to gather them will prevent any injnry, and when once tried there will he no hesitancy to repeat the experimsnt.

They vary in color from snow-white to almost black on the surface, but when young and edible are a creamy-white within and of the consistency of fresh cheese. One of them is eometimes enough for an entire meal for three or four persons. When bright yellow stains appear they are to be rejected as injurious. Like all mushrooms, they are good only when young, and must be eaten while fresh, as they soon decay and become poisonous. There is no danger, if one ie careful to observe the above directions. If the odor or taste is unpleasant, they are too old and mnst be discarded.

They may be cut in thick elices and broiled as a steak, or in thin elices and dipped in egg and bread crumbs and fried. I prefer them cooked with cream and seasoned with butter, like oystere, and then served on toaet. It is a great pity that so few know of their value.

Henry Loomis.

San Rafael, Cal.

Some Old Mexican Mines.

William Jennings, who has rssided in Msxico for the last 31 years, writes us the following from Bahacomri district, some seven lsegues from Arispe:

This district was discovered in the latter part of the last century, and extensively worked hy ths then Governor of the Occidente, (which comprised the now States of Sonora, Senaloa and Lower California) Don Alejo Garcia Conds, his principal mine was ths Carmen, and from his own written statement when he left to join in ths war for independence, he left ths mine in Bonanza, there being 18 inches of ore that weighed one-third its weight in bullion worth $2½ per ounce. Thie mine has several openings, in three of which I have found ore. In one the vein is six feet wide, with ore that assays from $100 to $500 per ton, which with the gold, makes it worth from $200 to $1,000 per ton. The prospect is the moet flattering I have seen in my mining experience. The mine of greatest note nowadaye is the San Francisco, or as the Mexicane call it, the mine of the hig tunuel, which is 1,800 feet in length—900 feet before the ore vein was reached, and an equal distance after the vein was passed through—it is owned by Mr. Matios Aleua. This is truly a most valuahle property, and doee not take its proper place witb mines, as it has not been worked for the last 14 yeare. The ownere were Frenchmen, and during the French invasion of Mexico, got into difficulties which are now eettled, and Mr. Alsua is to commence work in April next. To this mine there is an immense tunnel, baving an average width of 12 feet hy 15 feet in hight; the works from the tunnel are down 210 feet, showing large quantitiee of ore all the way down. There are several pillare of ore in this tunnel that will average $7,000 per ton and some as high as $20,000. From the tunnel to the surface it ie about 400 feet, and ore in the croppinge for the whole length of the claim. I have located the first extension northweet of this vein. On my location there ie an open cut some 30 feet deep hy 50 long, the ends and bottom of whichare in oreassaying 50 ounces per ton, wortb $100 here. There is ore enough in sight for a 10-etamp mill. The vein is 10 feet wide and the croppings for a hundred yards are in ore.

There are other locations in this district, but I do not wish to try your patience with a description of their prospects, hut will add that were they in your Territory, they would be worth millions.—*Arizona Citizen.*

Weighing an Elephant without Scales.—An Indian writer relatee an interesting anecdote concerning Shahjee, the father of the first ruling prince of the Mahrattas of Hindostan, who lived at about the beginning of the 17th century. On one occasion a certain high official made a vow that he would distribute to the poor the weight of his own elephant in silver money; but the great difficulty that at first presented itself was the mode of ascertaining what this weight really was; and all the learned and clever men of the court seemed to have endeavored in vain to construct a machine of sufficient power to weigh the elephant. At length, continues *Little Folks*, it is said that Shahjee came forward and suggested a plan which was eimple and ingenious in the highest degree. He caused the unwioldly animal to be conducted along a etage, specially made for the purpose by the water side, into a flat-bottomed boat; and then, having marked on the boat the bigbt to which the water reached after the elephant had weighed it down, the latter was taken out, and stones suhstituted in sufficient quantity to load the boat to the same line. The stones were then taken to the scales, and thus, to the amazement of the court was ascertained the true weight of the elephant.

The Mysteries of Tulare Lake.—Fourteen human skulls ranged round in a circle, were found on an island in Tulare lake, California, a few weeke ago. The mysterious reminders of some lost romance were in the middle of the island, a small patch of grass, thick brush and pigmy cottonwood trees. No other bones could bo found near them. Near by on the shore of the island were two hute of basket work, but hoth untenanted. Tulare lake probably is the most mysterious epot on the continent. It is 300 miles south of San Francisco, on a great plain. Ae the traveler approaches, the water appeare to be higher than the land. The dry land of the plain gives place to damp soil a mile or so before the water is reached. When the margin is found at last one may wade out for more than a mile and not get in above the knee. The lake rune 40 miles. The bottom is formed of powerful clam shells, and there are hundreds of small islands and hunches of tules. Millions of white birds of the gull kind tenant the islands, flock high in the air, or skim the still water. In the Indian eummer the whole lake ie veiled in mist. Mounds have been found all along the shore, and before many months the whole bottom will show tracee of a submerged city.

A Canyon City especial says: It is stated that agents of the Denver and Rio Grande railroad are bringing 2,000 men from Omaha to work on the Leadville extension of that road, and will have trains running into Leadville in 75 days.

The first iron works in America were erected in 1619, at a place called Falling Creek, a branch of the Jamee river, not far from Jamestown, the first settlement of the Virginia Colony, 32 miles from tbe sea.

MECHANICAL PROGRESS.

Successful Device for Grinding Chilled Iron Car Wheels.

The desirability of having car wheels perfectly round is conceded by all railway men. As a matter of fact, it is doubtful if any of the chilled iron wheels in use are perfectly round, and new wheels will often be found to vary 1-16 to 1-8 of an inch, and even more, from being perfectly true. Wheels in service also are far too frequently flattened by being slid, as a result of carelessness on the part of the brakeman or of the engineer in control of the air brake. Of course when a wheel is not perfectly round there is much more danger of its being held by the brake and flattened.

On the Virginia & Truckee road, in Nevada, it has been found that 85% of the chilled wheels condemned as unfit for service, were flattened wheels. This, of course, is an unusually large proportion, as the curves and grades are extremely severe and numerous on this road, but on even the most level roads the number of wheels flattened in a year is astonishing.

A process of truing wheels by grinding, invented by Mr. J. H. Gowan, formerly master mechanic of the Virginia & Truckee railroad, and owned by the Chilled Car Wheel Grinding Co., has been adopted by the road named, and 16 pairs of wheels trued by this process were placed in operation in October 1, 1877. These wheels have made upwards of 100,000 miles and still appear in perfect order, although subjected to unusually hard service. This is a remarkable showing, and indicates the possibility of a very great economy in railway operations. If flattened wheels, instead of being melted up for old iron, can be trued and again placed in service, it is evident that the saving will be enormous—the inventors of this device claim nearly 50%. The grinding is done by placing a pair of wheels, after being fitted on the axle, upon solid bearings and slowly revolving them while a solid emery wheel, 18 inches in diameter, is revolved in the opposite direction against the face of each iron wheel at a speed of 600 revolutions per minute.

One of these machines has just been put in operation at the shops of the Chicago, Rock Island & Pacific road. It proves that the best new wheels are very much out of true, and the company now proposes to have all its passenger car wheels ground down, being satisfied that the process will add to the smoothness of the cars in riding, will be easier on the springs and on the track, and will do much to prevent the flatteniag of wheels by the brakes. They will also have the flattened wheels ground, and expect to save a large number in this way which are now condemned as old iron.

It is expected that one machine will grind from four to six pairs of wheels per day. The royalty charged for the use of a machine is 50 cents for each wheel ground. A machine will cost about $750, and the cost of the emery is from 8 to 25 cents per wheel according to the condition of the latter.

The invention has been in use over two years on the Virginia & Truckee road, and is also used by the Central Pacific road with very satisfactory results.—*Railway Age.*

Diameters and Number of Teeth for Gear Wheels.

Rule 1.—As the number of teeth in the wheel + 2.25 is to the diameter of the wheel, so the number of teeth in the pinions + 1.5, to the diameter of the pinion. Example: The number of teeth is the wheel = 210; the diameter of the wheel = 25", and number of teeth in the pinion = 30; to find the diameter of the pinion: As 210 + 2.25 is to 25, so is 30 + 1.5 to 3.7102 the diameter of the pinion.

Rule 2.—To find distance of centers between two gears (or gear and pinion). Rule: As the number of teeth in the wheel + 2.25 is to the diameter of the wheel, so is half the number of teeth in pinion + half the number of teeth in wheel, to the distance of their centers. Example: The number of teeth in wheel = 210; the diameter of the wheel = 25"; and the number of teeth in the pinion = 30; to find the distance at which their centers should be placed. As

$$210 + 2.25 \text{ is to } 25 \text{ so is } \frac{30 + 210}{2} \text{ to } 14.1342 \text{ inches}$$

the distance of their centers.

I also give some rules as to velocities. When wheels are applied to communicate motion from one part of a machine to another, their teeth act alternately on each other; consequently, if one wheel contains 60 teeth another 20, the one containing 20 teeth will make three revolutions, while the other makes but one. From this the rule is derived; namely: Multiply the velocity of the driver by the number of teeth it contains, and divide by the velocity of the driven, the quotient will be the number of teeth it ought to contain. Or, multiply the velocity of the driver by its diameter and divide by the velocity of the driven, the quotient will be the diameter of the driven.

If the velocity of driver and driven are given with the distance of their centers: The sum of the velocities is to the velocity of the driver multiplied by the velocity of the driven as the distance of centers is to the radius of driver multiplied by the radius of driven.

Example 1.—If a wheel that contains 75 teeth makes 16 revolutions per minute, required the number of teeth in another to work in it, and make 24 revolutions in the same time.

$$\text{Here} \frac{75 \times 16}{24} = 50 \text{ teeth; the answer.}$$

Example 2.—If a wheel 64 inches in diameter, and making 42 revolutions per minute, is to give motion to a shaft at the rate of 77 revolutions in the same time; required the diameter of a wheel suitable for that purpose.

$$\text{Here} \frac{64 \times 42}{77} = 34.9 \text{ inches; the answer.}$$

Example 3.—Required the number of revolutions per minute made by a wheel 20 inches diameter, when driven by another of 4 feet diameter, and making 46 revolutions per minute.

$$\text{Here} \frac{48 \times 46}{20} = 110.4 \text{ revolutions.}$$

Example 4.—A shaft, at the rate of 22 revolutions per minute is to give motion by a pair of wheels to another shaft at the rate of 15½; the distance of the shaft from center to center is 45½ inches; the diameters of the wheels at the pitch lines are required.

Here $22 + 15.5$ is to 22 as 45.5 is to diameters required. $\frac{22 \times 45.5}{22 + 15.5} = 26.69$, number of inches radius of the driven wheel, which doubled gives 53.38 inches, the first diameter required, and 45.5 inches − 26.69 inches = 18.81 inches, is the radius of the driver, which doubled give 37.62 inches the second diameter required.—*T. W. McCabe, in American Machinist.*

To Galvanize Small Articles of Iron.—A correspondent of the *Manufacturer and Builder* describes, as follows, the difficulties he encountered in trying to galvanize some small iron hooks: "I could not make the zinc take to the iron. I used a pint of sulphuric acid, pint of muriatic acid, pint of sal ammoniac, and zinc enough to cover the hooks. I first dissolved the zinc with muriatic acid, then I reduced the sulphuric acid with water. I then dissolved the sal ammoniac, then I dipped the hooks into the sulphuric acid, then after washing it off, I then dipped it into the muriatic acid; after taking it out and letting it stand for some time, I then dipped it into sal ammoniac, after taking it out and letting it stand some time, I then dipped it into the zinc, but on taking it out the zinc would not stick to it. Can you tell me where the trouble is?" The editor answers his query as follows: Clean the metal by pickling in the dilute acid, and scouring (or tumbling) with moist sand, if necessary. Rinse quickly in pure water, pass through the chloride of zinc solution, and then transfer to the zinc pot. Keep the melted metal covered with dry sal ammoniac. Moist iron rusts very quickly when exposed to the air, and unless the surface is perfectly freed from this oxide it will not take the zinc.

What is a Carload.—It appears that the load which may be most economically placed upon a freight car is undergoing some considerable modification. The tendency to increase the load is strikingly shown by the fact that the United States Rolling Stock Company is now building, in Chicago, 500 cars intended to carry 20 tons each. The dimensions of these cars are the same as of those built heretofore by this company to carry 16 tons. They weigh 20,200 lbs.; those built in former years weighed about 24,000 lbs., and were intended for 10 tons but were capable of carrying more, although this has not been understood by railroad managers, until they were taught so by shippers who would load them to their full capacity. These cars are for no particular road, being built for leasing. It is notable that these 20 ton cars weigh less than those for which 10 tons used to be considered the maximum load. Of course the heavier load is more profitable, provided it does not tell too much upon the car and track.

A File of Novel Construction.—Mr. J. Kirkwood, of Edinburg, Scotland, has recently invented a new file for soft metals and wood. It is formed of about two hundred separate pieces of steel, connected by an iron bar, which is passed through, and binds them together by a screw. The advantage claimed for the file is, that filings of soft metals or wood can be got rid of by simply loosening the screw, and thereby separating the plates, this being done with very little delay or inconvenience. Each file will, it is said, last three years, outwearing 30 dozen ordinary files. The cost of the latter would be £36 ($180) and the saving that would be effected by using the new file would be £32 ($160). Mr. Kirkwood's file is said to be capable of performing quicker and better work than the cut files in ordinary use.

A Floating Railway Station.—The latest plan for crossing the dreaded English channel, says the *Railway Age*, is embodied in a model now before the admiralty for a monster floating railway station, which is to carry trains across the channel at the rate of 14 knots an hour. It is stated that "each train would provide accommodations for 2,000 passengers," which we should say would make the largest train ever heard of—requiring 60 or more railway carriages.

SCIENTIFIC PROGRESS.

Lecture on Coal.

Professor T. Rupert Jones, F. R. S., has delivered a course of illustrated lectures at the Royal Institution on "Coal." He could not bring to the knowledge of his audience anything very new; all he contemplated was to present in one view the facts bearing on the subject so far as they had been ascertained by the latest scientific researches. He began by describing a lump of common household coal. It presented a seamy structure, composed of parallel plates. There was a bright, shiny face, contact with which did not soil the hands, as happened when we touched it in the transverse direction, where the surface was of a decidedly dull appearance. In trying to break the coal ignorant people were wont to strike it on the bright side and found the task troublesome, while the intelligent easily separated the plates by directing their blows to the dull surface. Of course the plates came asunder more readily in proportion as they became heated. Some kinds of coal were very brassy, being streaked with flakes of a metallic luster, often mixed with others of a white color. The latter were sulphate of lime, and the brassy-looking flakes were sulpburet of iron, commonly called iron pyrites. Other impurities in coal were noticed, such as "slates," which were rather of a clayey nature. No kind of coal was to be judged by its appearance only; the fiery trial was the sole true test. He showed specimens of bitumen from Trinidad, which, as was explained, has been greatly changed by contact with a lower stratum of volcanic coal. Having mentioned granulated coal, he described anthracite, a highly bituminized kind of coal, which was smokeless. Alhertite, rivaled anthracite in brightness and general appearance, but was of a different nature. For the purpose of determining of what coal consists, it was macerated for several weeks in a solution of caustic potash, after which it was found to be of a leathery consistency, the mass being in layers which might be lifted up one by one and were like layers of compressed bark or wood. Another process was boiling in nitric acid. The microscope revealed that the layers were really woody tissue, half-a-dozen forms of which, as found in coal thus treated, were shown by the lecturer on a diagram. Whole plants, with stems many feet long had been handed over to botanists and had been recognized as conifers, etc., of extinct species. Diagrams exhibited branches of these fossil trees, and drawings of *lycopodium* and *equisetum* were handed round among the audience, as well as others depicting *lepidostrobus* with its microspores and *Bowmanites* with its microspores. These spores, lesser and larger, played a great part in the history of coal, said the lecturer, as he held up a piece of coal picked out of a cellar that morning and presenting "lovely little bits of *lepidodendron*" marked distinctly upon it. How the pollen-showers from the conifers and the germs scattered by mosses and other cryptogams helped in the formation of coal was graphically illustrated by the analogy of the evergreen jungles in the Eastern Archipelago, with their luxuriant vegetation. All they knew bore out the definitions of coal given by Dr. Redfern and Professor Jukes. The former said that under that name "those substances must be comprised which consisted of compressed and chemically altered vegetable matter associated with more or less of earthy substances and capable of being used as fuel." Professor Jukes defined coal, geologically speaking, as "a stratified rock always found in beds inter-stratified with other rocks, such as clays, sandstones and occasionally limestone."

He proceeded to state the conditions under which coal is found in the earth, explaining that for the purpose of popular exposition it might be classified in about half-a-dozen groups. First came those containing a maximum of bitumen, or mineral pitch, many of which sorts were extensively used in the manufacture of gas. The albertite, found in large quantities in New Brunswick and sometimes met with in Scotland, belonged to this group. Next was a variety made up of vegetable spores, such as club-mosses and puff-balls, examples of which were the white coal of Tasmania and a variety of Bradford coal. Analogous to this was the true cannel coal, closely compacted of vegetable tissue. The common bituminous coal, which was used under many names as fuel in our parlors and kitchens, formed another group, to which might be subjoined the semi-bituminous kinds of coal, containing much charcoal. To the anthracite group belonged the best steam coals. They were smokeless, burnt with little flame, but developed heat very rapidly, converting water into steam in a minimum of time. Approaching the subject of the coal measures, the lecturer showed that all the geological formations connected with them contained stratified accumulations of organic remains, mostly vegetable, and often of great economic importance. The underlying beds represented the soil in which grew the forests afterwards fossilized into coal, and in these geological soils plenty of rootlets were accordingly met with. The shales, occurring in masses or laminated, were sometimes of a clayey nature, sometimes of decomposed granite, such as the London traffic ground out of our macadamized streets, or like the fresh soil now in process of natural formation by the weathering of the rocks on Dartmoor. The carbonaceous admixture in the shales was often turned to good account, mineral oils etc., being extracted from them. The materials of other coils were arenaceous or sandy, running into gritty, pebbly and conglomerate masses, often testifying to the action of water, mostly fresh. Sometimes the strata were calcareous, limestone being pretty frequent, with streaks of ironstone often containing the rarest fossils. The organic remains found in the ironstone were some of them marine, and others indicated a fresh-water formation. Some account was given of the geographical distribution of coal throughout the world, descriptions being illustrated by reference to specimens, diagrams and geological maps. The lecturer acknowledged that much had yet to be learned about the natural history of the coal measures, the order and extent of the special kinds of their animals and plants, the time occupied in their formation, and the geographical and hydrographical conditions.—*Colliery Guardian.*

Chemical Repulsion.—In a paper read on the 13th of January before the Royal Society, Dr. E. J. Mills claimed to have discovered a new order of chemical phenomena, which he has provisionally designated as "chemical repulsion." If a thin layer of a solution of chloride of barium be distributed evenly between two plates of glass placed horizontally (excess being removed by pressing the plates together), and then dilute sulphuric acid be brought into contact with it through a perforation made in the upper plate, precipitation takes place and continues progressively and uniformly from the perforation as a center; forming an increasing circle, for instance, if the perforation be circular. If the sulphuric acid be introduced through two perforations in the upper plate, two circles are formed, but as their circumferences approach each other development is retarded between the perforations, the figure of advance being no longer circular, but oval, and, however long the experiment may be continued, there always remains a line of demarkation of "no chemical action" between the two figures. When there are perforations at the four points of a square and one in the center, the center circle, having, as it develops, no way of escape from the surrounding four, eventually forms a square figure bounded by repulsion lines. Dr. Mills considers that the phenomena observed afford proof of two propositions: (1) That chemical action can take place at a distance; and (2) that two or more chemical actions, identical except in position, completely exclude one another.

Mexican Antiquities—Proposed Exploration.—It is announced that Mr. Lorillard, the great tobacconist of New York, has entered into an agreement with the French government to assist in a scheme for a thorough exploration among the ancient ruins of Mexico. Mr. Lorillard himself gives $20,000 at the start, and promises more when needed. M. Charnay, the French scientist and explorer, will have charge of the expedition, and his report will appear in the *North American Review;* but whatever relics are secured will go to Paris. This, however, will not be so very unfortunate for our own country, from the fact that there is a stringent law in Mexico which forbids the exportation of Mexican relics, so that only casts can be taken abroad, which may, of course, be duplicated for our own museums. The field to be explored is rich in relics, and the hope is that some key may be found by which the hieroglyphic language of those ancient races may be translated. This ancient people were undoubtedly great architects, possessing the power of moving immense masses of stone, and were quite lavish in their architectural ornamentations. It is altogether probable that M. Charnay may do much towards reaching a solution of the interesting questions of historic and prehistoric interest, which the explorations thus far, in these fields, have secured.

The Fracture of Cast Iron.—At a recent meeting of the Civil and Mechanical Engineer's Society, of London, the President read a very interesting paper, by Mr. James Love, on the above subject. In the paper the author went at considerable length into the matter, and described experiments on the peculiar form of fracture of cast iron, and showed its similarity to the fracture of other materials such as glass and sealing-wax. The author further showed by his experiments, these lines to be nearly at right angles to the lines of equal stress, demonstrated by the Astronomer-Royal some years back. Arguing from this stand-point, Mr. Love proved the viscosity of many materials and its connection with heat and regelation, which he has found in many substances including iron, and showed that the ordinary process of welding iron was due to regelation, and the cast iron could not be welded in consequence of the presence of carbon in the form of graphite. A short discussion ensued in which several gentlemen expressed that the facts (many of them original) demonstrated by the author were of sufficient importance to require a special evening devoted to their consideration, accordingly the discussion was adjourned.—*Engineering.*

M. Thollon has recently observed, by the aid of his spectroscope of high dispersive power, a solar protuberance whose hight equaled one-sixteenth of the diameter of the sun, or about 55,000 miles. It is only quite recently that observers have been able to witness such a phenomena at any other time than during a total eclipse—the protuberances being projected out and beyond the moon's disk, while it covered the sun.

Mining Share Market.

There is no stability in the stock market. Those who possess money will not invest, and those who have not got it cannot obtain stock upon entire credit. Attempts are made continually to produce a "boom," but there is not power, force or vitality enough to move tho now inert mass of heretofore vivacious speculation, and the intended advance results in a general retrograde line of prices. As times grew dull some long time ago, the manipulators began to quarrel among themselves, and in the excitement of their disputes told some plain truths, which they corroborated by potent facts, the which, tho outsiders are ungenerous enough to retain in their memories. There was too much divulged in these squabbles to allow of the people being gulled afterwards as they have been previously; and no matter how temptingly the bait is displayed the old rats who have learned wisdom by experience cannot be induced to nibble at it, and so fall into the trap.

The tendency of prices has been continuously downward for many weeks; the investments have been, outside of stock operations, into paying and creditable mines. Capital is seeking good mines, not for the uncertainty of stock transactions, but for true and legitimate mining.

Assessments are far more numerous than dividends in speculative mines, and to those who need money such a status is not attractive. The operators attribute the dullness to various causes—all of them far from the right ones. They invent so many statements to cover their defeat from time to time that it would be ludicrous, were it not so humiliating to contemplate. They now attribute the present still further drop down, to the breaking of the pump hohs in the Union shaft. It is true that this accident is a set back to this particular mine, and perhaps also to some contiguous properties. But those pump bohs did not move for the entire line of mines whose stock is listed upon the boards. Important as they were to the mine in question, they could not affect the mining welfare to a sufficient extent to depress the prices on the entire list. The true cause of the depression in stocks in this market is that the people have lost all confidence in the manipulators fair dealing.

If the New York markets are not managed on a different principle from those in this city, the miuing stock husiness there will meet with a speedy downfall.

Bullion Shipments.*

Since our last issue, we have noticed the following hullion shipments :

Golden Terra (B. H.), Mar. 17, $17,000; Northern Belle, Mar. 29, $8,435.04; Mar. 31, $8,707.74; Bodie Con., Mar. 29; $6,424; Christy, Mar. 29th, $2,029.26; Apr. 1, $7,771; Apr. 2, $3,402.75; McCormick & Co., Mar. 27, $5,560; Mar. 29, $6,040; Mar. 30, $17,920; Apr. 1, $8,760; Mar. 31, 5,430; Apr. 2, $8,240; Horn Silver, Mar. 30, $4,268.16; Apr. 1, 24,277 lbs.; Tombstone, Apr. 2, $14,600; Ivanpah, Apr. 4, $7,030; Wells, Fargo & Co., at Eureka, Mar. 31, $1,200; Richmond, Mar. 30, $17,418.43; Apr. 3, $24,173.05; Alexander, Mar. 15 to 26, inclusive, $14,874.98; Con. Virginia, Apr. 3, $68,039.31; California, Apr. 3, $73,065.43; Idaho, for March, $39,000; Barbee & Walker, Apr. 2, $5,396.73; Bremen's, Mar. 31, $5,255.

*Desiring to make our list of Bullion Shipments as complete as possible, we will be thankful to receive from mining Superintendents and Secretaries notice of all bullion shipments from their respective mines.

GEN. GRANT was invested with the title of Duke of America hy the Carnival Court at New Orleans a few days since.

RUFUS MORGAN died in Bernardo, San Diego county, a few days since, from the effects of eating poisonous mushrooms,

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

CAVE AT THE ZEILE.—*Dispatch*, April 3: A frightful cave occurred at the Zeile mine in the 240 level, which crushed in the old timbers like matches, and came near resulting in one of the most horrible calamities ever witnessed in the county. There were 15 miners at work in the tunnel at the time, but the alarm was given in time for all of them to make their escape except one man, named Nicola Noce, who happened to be in the back part of the tunnel. It was at first thought that he had been crushed to death under the falling mass of dirt, and all hands immediately went to work to dig him out. In the course of a few hours they discovered that he was still alive and unhurt, and succeeded in rescuing him from his underground prison.

MARBLE QUARRIES NEAR OLETA.—*Ledger*, April 3: The quarries are in active operation, and they are taking out some excellent quality of marble. It is of solid texture, and is being manufactured into monuments, tombstones, statues and every description of marble work. They have been in operation since last October. The work will be greatly enlarged during the coming season.

BUTTE.

MEREDITH.—Oroville *Mercury*, April 2: The ledge is 8 ft thick at the point discovered, running north and south and dips into the hill toward the main lode. The tunnel passed through the 8-ft solid vein, but for 20 ft (the distance in) it encounters talc-slate and similar substances, studded with quartz and quartz veins, rich in gold. The main lead is 200 ft distant and crops out boldly.

MAMMOTH BUTTE NO. 1.—The assay set forth that each ton of rock contained gold to the value of $72.34 and $12.90 silver.

BANNER.—*Register*, April 2: After being idle on account of the cave which took place 20 years back, was started up, thoroughly opened and a fine new mill built by San Francisco parties, some 4 months ago, and the first run of 5 days' work yielded $3,000, with prospects ahead as bright as ever shown upon a mining operation, when owing to one of those unfortunate misunderstandings among partners, which so often mar the brightest business prospects, took place and the mill was closed down, in which condition it remained until about 2 weeks since, when it was set on fire and burned to ground. A new mill is to be erected at once.

MONO.

BOSTON CON.—*Chronicle*, Mar. 31: The main incline shaft has reached a depth of 78 ft below the 200-ft station, a progress for the week of 14 ft. The bottom of the shaft is now in harder ground and of the same favorable character referred to in last report. The north drift has been driven 101 ft north from the station. Three samples of ore taken from this drift gave the following results: No. 1, gold, $27.50; silver, $4.75; total, $32.25. No. 2, gold, $30.13; silver, $3.14; total, $33.27. No. 3, gold, $42.61; silver, $125.03; total, $168.29. Samples 1 and 2 were taken from the middle and eastern portion of the vein, and No. 3 from the west side.

BLACKHAWK.—The shaft is down to the 700 level, with a 6-ft sump below. The station is in on both sides of the drift, and drifting has commenced to the east and to the west, and will be sent ahead as lively as possible.

MARYLAND CON.—The shaft is down 550 ft, from which station crosscutting has been going forward with favorable results. The crosscuts are in about 80 ft each way. This claim is now looking very promising, and the work is being pushed with energy.

SOUTH STANDARD.—For the past two days there has been an improvement in appearance of material passed through, being largely composed of clay and quartz of very favorable character, pitching to the west. Everything is working well.

NOONDAY.—*Free Press*, Mar. 31: The east crosscut, 500 level, is in 325 ft. On the 412 level the drift on vein No. 1, north, is in from the east crosscut 118 ft. Drift on the same vein south is in 123 ft. North drift on vein No. 2 is in from crosscut 93 ft. South drift, same vein, is in from crosscut 84 ft. They are now milling ore from this level. On the 220 level the stopes look better than ever, and are shipping ore from this level to the mill. The connection by the winze, from the 312 level to the 412 level, is completed, and gives fine ventilation to the 412 level. The stopes at the 200 level are opening up well.

SOUTH BULWER.—The main double-compartment shaft has been sunk 6 ft below the 550 level. The east crosscut, on the 550 level, has passed through hard porphyry mixed with seams of quartz and clay, and the appearances are very favorable for shortly cutting the vein. The west crosscut, 500 level, is in 31 ft.

BELVIDERE.—The main shaft is 35 ft below the 400-ft station. The east wall of the ledge carries 2 ft of bright, lively quartz. Assays from this portion of the vein range from $15 to $20 per ton. They have the west wall of the ledge, in the west end of the shaft, carrying 2 ft of quartz of the same value as that on the east wall. Between these 2 bodies of quartz there are 3 ft of irregular seams of quartz and porphyry, giving 7 ft between the walls.

BONE BLUFF CON.—During the past week an improvement has occurred in the ledge, both in size and character of rock. It continues the same uniform regularity in the incline, and has increased in width since last report 2 inches.

STANDARD CON.—The east crosscut, 500 level, is in from the shaft 220 ft. A crosscut was started west from the end of the north drift 500 level. It is in 20 ft. The east crosscut from the south drift, 385 level, is in 33 ft. Upraise No. 2 from the south drift has reached a hight of 104 ft. The ledge is 6 ft wide, of very rich ore. The upraise from the north drift is up 115 ft. The ledge is 4 ft wide, of good milling ore. The north drift on the east ledge, 300 level, incline, is in 232 ft. The ledge is 3 ft wide. The south drift from the west crosscut is in 200 ft. The ledge is 5 ft wide. The north drift, 550 level, is in from the winze 132 ft. In the north drift, 335 level, they are now taking out very fine ore. The ledge in the West Standard stopes is 5 ft wide. In the Gildea stopes the vein is 4 ft wide, of good ore.

HOMER.—The tunnel on the Crevasse vein is in 101 ft. The vein averages 2½ ft in thickness and $30 per ton. A drift has been started on the Seneca vein and run 0 ft. The vein holds a width of 2½ ft, and will mill from $70 to $75 per ton.

TIOGA CON.—The station at the 500 level is completed, receiving tank put in place, and shaft sunk and timbered 14 ft below the station. Crosscutting from the 300 level, both east and west, has been commenced. The east crosscut is in 9 ft, and the west 16 ft.

SUMMIT.—The north drift, 530 level, is in from the shaft 177 ft. The ledge is 2 ft wide.

ADDENDA.—The shaft is 324 ft in depth; the bottom in vein matter carrying bright, lively quartz and seams of mineral-bearing clay. The indications are good for soon cutting the rich ledge opened in the old workings.

CON. PACIFIC.—*News*, Mar. 31: The shaft is a fine double compartment one, and has a depth of 500 ft. At the 400 level a station has been opened and drifts started north and south. The north drift has been run 00 ft, at which point it deflected to the east and has been driven a distance of 130 ft, crosscutting the country, making a total distance of 100 ft. At 140 ft a vein of bright, lively quartz 2 ft thick has been cut, a large part of which is good milling ore. The crosscut extends 30 ft, cutting a vein 2½ ft wide of low-grade ore. A drift was started and is now following the vein north. The quality of the ore is improving as advance is made. This drift is now in the ore body 20 ft, showing a ledge the full width of the drift, carrying fair milling ore. The south drift on the 400 station is in 183 ft.

SOUTH NOONDAY.—The north drift on the 150 level has a total length of 53 ft. The ledge in this drift is 6 ft wide of good ore. The south drift on the same level has a total length of 45 ft. The ledge in this drift is 4 ft wide, of good ore. They are raising 4 tons daily.

BULWER CON.—The north drift is in from the tunnel 135 ft. The ledge is 2½ ft wide and looks well. The south drift is in 131 ft. The ledge in the Stonewall stopes is 2 ft wide, of very good ore. In the stope on the Ralston the ledge is 3½ ft wide, and looks well.

DOUBLE STANDARD. The north drift is in from the crosscut 25 ft. The ledge is 3½ ft wide, and looks well. The winze is down 35 ft. The ledge in the bottom is 3 ft wide, of good ore.

QUEEN BEE. The north drift on the 400 level is in 558 ft. The ledge is looking well, carrying good ore and holding out in width. The east crosscut, same level, is in 57 ft.

BENTON ITEMS.—Con. Ogg arrived yesterday, via Benton, where he remained for 12 days, prospecting the district. He located 3 mines, the New Mexico, the Colorado (an extension of the New Mexico) and the South America, 3 miles south of the New Mexico. The latter is on old location running back to 1864, at which time a tunnel 65 ft long, and another 75 ft long, was run on the ledge, and in each of the tunnels a winze 50 ft deep was sunk in the ledge, the ore assaying, on an average, $300 to the ton. The ledge shows clear-cut and well-defined walls that can be distinctly traced for 3,000 ft. The Diana mine is now 800 ft deep, with a 6-ft ledge that will average $1,000 per ton. They are working the mine with a whim.

NEVADA.

BIG BLUFF.—*Transcript*, April 2: An assay of the ore yielded $614.93 in gold and $4 in silver per tou; a second piece of quartz from another part of the claim paid $128.61.

MOHICAN.—The last crushing of ore consisted of 87 tons, and paid an average of $20 a ton. The pump gearing invented by John Reseigh, Superintendent of the mine, has for 2 or 3 days been in operation, and is a success. It is worked by a one-horse power, and raises from 8 to 10 gallons of water a minute a distance of 120 feet. It is comparatively inexpensive, costing only $100.

STRIKE ON GOLD FLAT.—The croppings of a small ledge were found, 300 ft east of the old Mohawk hoisting works, at a depth of 25 feet, the ledge widening to 8 inches. It is now well defined, and it will pay an average of $75 a ton.

EUREKA, No. 2.—This mine is worked through a tunnel 400 ft in length, that gives 120 ft backs on a ledge varying from 8 to 24 inches in thickness. The ore mills an average of over $8 a ton, some of it paying $20. The formation is uniform in size and richness. It is opened sufficiently to enable 12 tons to be produced a day regularly.

TUOLUMNE.

BONANZA.—Sonora *Independent*, April 3: About 0 months ago the company extracted from a pocket, with a few days' labor, something near $175,000, and gross yield for that month was rising $300,000. The total yield of the mine since its discovery reaches a half million dollars. This is a pocket vein and in a pocket locality.

DAVIS & ROBBINS.—This mine adjoins the Bonanza, and is being prospected systematically. The shaft is down 100 ft. A portable 2-horse power engine furnishes power for hoisting ore and waste material.

GIGANTIC SULPHURET.—The course of the lead is northerly, and from 400 ft to 000 ft in width, and has been traced on the surface over 1 mile. This lode or ledge differs materially in its character from any known metallic vein in the county. The vein matter is of talcose nature, having a whitish color, and the sulphurets are charged with gold.

GOLDEN GATE.—Has been successfully worked since the mill, which has been kept in continuous operation, was erected a number of years ago. The ore carries a large percentage of gold-bearing sulphurets. The concentrated sulphurets are shipped to San Francisco to be treated. This is one of the best mines in the county at present being worked, among the milling veins.

ITEM.—One night (about 1 o'clock) the present week, a gentleman who resides in the upper part of town was attracted to the front of his dwelling by the furious barking of his watch-dog. On going to the sidewalk he encountered a young man with whom he was acquainted, carrying his hat under his arm, "nearly full of gold specimens." "Now that you have caught me," said he, "I will show you a small portion of *my* big bonanza." He said "*that* wasn't a circumstance," that "he had two barrels full of gold specimens buried, like the ones in his hat," and that "there was any quantity more of the same sort in the vein, which he had not taken out." After instructing him to keep his name a profound secret, he requested him to pick out a good piece, and then went on his way. The claim is within the city limits, but in what particular locality we are unable to state.

NEVADA.

WASHOE DISTRICT.

SIERRA NEVADA.—Gold Hill *News*, April 7: The east crosscut, 2300 level, 600 ft north of the east shaft and opposite the main shaft, has been discontinued; its face is 30 ft east of the main north drift. The presence of water in that part of the ledge is feared. The crosscut west has been discontinued on the same account, and a drill will be sent ahead to guard against water. The north drift on this level is in a very fine quartz formation. The winze from the 2400 level, 145 ft north of the incline, is being continued down.

OPHIR.—Winze No. 2 from the 2100 level is down 42 ft. The north drift on the 2200 level is in from the main southeast drift 265 ft. Crosscut No. 1 east on this level is in 130 ft. On the 2300 level the chamber in the joint Mexican east crosscut has been completed, and the winze for the 2500 level started. The crosscut is in 280 ft. The main north drift on the 2500 level is in from the incline 345 ft. The east drift on this level is in from the incline 280 ft.

BELCHER.—The south drift along the ore vein is 115 ft from the east crosscut, and continues in an excellent vein material. On the 3000 level the south drift is being continued. The east crosscut on this level was pushed 80 ft into a fine vein formation carrying bunches of good quartz, and a diamond drill was then sent in 40 ft and tapped the hot water, which flooded the level and stopped work. Tbis water has been pumped out.

SILVER HILL.—The crosscut east ou the 1300 level is in 1,475 ft. The lateral drift south on this level is cutting ledge matter, and evidently nearing the quartz vein encountered in the crosscut 1,000 ft east of the incline; total length, 155 ft.

UTAH.—Total depth of the incline, 54 ft below the 1050 level. Sinking has been discontinued to place a tank under the 1050 station. On the 1750 level a crosscut has been started east from a polut in the south drift 300 ft from the incline.

CON. IMPERIAL.—Running north on the 2800 level through a mixture of quartz and porphyry; total length of this drift, 320 ft. Sinking a sump below the 2800 level on the Alpha line, preparatory to opeuing out the station and drifting south to meet the north drift on that level.

LADY WASHINGTON.—West crosscut No. 3, 1550 level, has been run 133 ft, having passed entirely through the vein and 4 ft into the west wall, where it was discontinued. Some fine quartz has been encountered but no pay ore.

UNION CON.—An accident occurred about midnight on the 1st inst., when every balance bob in the shaft broke. These bobs are placed at the 250, 000, 1100, 1500, 1700 and 1900 levels. They are of cast iron and calculated to carry each 20 to 40 tons of ballast to balance the rods of the pumps. They were each carrying on an average about 30 tons. The breaking of the balance bobs threw all the weight of the rods and attachments upon the engine, which was not less than 180 tons. The accident will cause a delay of 3 or 4 weeks in starting the pumps, and will also interfere with the use of the shaft for the work to which is was about to be put. Winze No. 1 from the 2400 level will this week reach the 2500 level, and will be continued on down for a sump before workings on that level are commenced. The southeast drift, 2400 level, is in from the Union shaft 445 ft.

OVERMAN.—Crosscut No. 2 east is being continued through vein porphyry; total length, 350 ft. The raise from the 700 level is in softer vein matter carrying streaks of quartz; total length, 50 ft.

CALIFORNIA.—West crosscut on the 1500 level is in 195 ft. The raise from the 2100 level is up 45 ft, and in quartz giving low assays. Daily yield 70 tons of ore.

NORTH BONANZA.—The winze from the 400 level in the ore body shows a slight improvement in the quality of the ore. An effort is to be made to use a concentrator and work this ore. Assays made from concentrations give $86 per ton.

CON. VIRGINIA.—The stopes continue their accustomed yield of 175 tons of ore per day, which comes from the 1550 and 1750 levels. The joint California crosscut east on the 2200 level is in 242 ft.

YELLOW JACKET.—The crosscut west, 2700 level, has been discontinued; its face is 273 ft from the south lateral drift. The shaft is being continued down, and is nearing the 2900 level.

SUTRO TUNNEL.—The north header is now 2,000 ft from the main tunnel and less than 200 ft from the connection with the drift west from the O & O shaft. The necessary repairs to the south lateral branch have proved to be more extensive than was at first supposed, and work in the south header has not yet been commenced.

BULLION.—The east drift on the 2350 level is in good ledge matter; total length, 40 ft. The incline winze below this level is also in fine ledge matter; total depth, 30 ft.

BELMONT DISTRICT.

BELMONT.—*Courier*, Mar. 27: The pay streak of ore in the 300 level drift has greatly improved, with prospects of a large body of high-grade ore. Connection with the north end of the mine through this drift will allow of taking ore out at small cost. As soon as they make this connection they will have plenty of air, thereby enabling them to continue the upraise without delay. The crosscut running west from the 300 level is in 74 ft.

BALCOMBE.—Have started a level south, on Cinnabar ledge, 1,065 ft from the mouth of the tunnel. The ledge is 4 ft wide, sulphuret ore, assaying $147.63 per ton in silver. They are in on the ledge 5 ft, and have struck a body of black metal and cinnabar ore. Chloride strikes from the level in the north incline assay, from stope, $332.72.

SAN ANTONIO.—The main 450 level is in 36 ft. The vein improves in character every day.

JETT CON.—The Centennial shaft is down 100 ft. They are now opening the No. 1 station, preparatory to running the east and west levels, as well as the sinking of the 2d 100 ft. The Idlewild tunnel is in 120 ft.

EUREKA DISTRICT.

EUREKA CON.—*Sentinel*, April 3: Second level—North drift in 136 ft. Seventh level—North drift in 134 ft; northeast drift in 237 ft. Eighth level—Southeast drift in 300 ft. Ninth level—Southeast drift in 110 ft; north Burleigh in 66 ft; upraise No. 1 in 34 ft; upraise No. 2 in 13 ft. Tenth level—East drift in 294 ft. Eleventh level—North drift in 177 ft.

GRUBER & BERTRAND.—A few days since the workmen cut into a body of ore at the bottom of the 300 level. It is said to carry the richest ore ever found in this remarkably rich mine. The gangue is in the nature of iron profusely stratified with seams. Running through all of these seams are flakes or ribbons of pure horn silver. The discovery is something out of the line of the finds hitherto made in this section. Horn silver has never been characteristic of the ores of this district.

SAN JOSE.—The late discovery is proving to be one of the most valuable ever disclosed in this district. The ore body has been penetrated a distance of 17 ft, and the bonanza found to be widening both to the right and to the left. The dimensions are yet undetermined. Assays run from $195 to $287 per ton. Choice pieces of ore are frequently encountered so impregnated with free gold as to render the precious particles visible to the naked eye. These specimens would no doubt assay away up into the thousands, but the tests thus far have been confined to average samples.

ALBION.—The Albion strike seems to get better and better. The accounts of the recent development were substantially correct, including the assays of $120 and $187 to the ton. The strike was made at the head of the main drift, 335 level, near the Tiptop, and on the Albion side of it. The dip of the ore is to the northwest, which will throw it still farther on Albion ground at greater depth.

PHIL SHERIDAN.—The mine has a vertical shaft of 45 ft; thence southerly a drift that runs through a small body of low-grade carbonate ore at its terminus, showing rich ledge matter. The main incline is down 125 ft, all the way through strata of oxide of manganese and carbonate ore.

COLORADO.—There has been considerable work done on the mine and some $10,000 worth of ore bas been extracted. The ore averages between $60 and $70 per ton. There is also a large amount of ore in the mine that will assay $50 per ton.

ORIENTAL & BELMONT.—This property comprises a strip of mineral territory on the great lode leading down from Ruby hill, 1,500 ft in length by 450 ft in widtb. The deepest working is a perpendicular shaft of 185 ft. There are several other shafts, cuts, excavations, etc., on different portions of the property.

RAGINE.—This is a claim 1,200 ft long by 200 ft wide. It yielded largely in its early history.

BOWMAN.—This mine is in the hands of an Eastern company and is situated well up towards Ruby hill.

SILVER LICK.—This mine is a well-known bullion producer. It is acknowledged to be one of the very best mines in any part of Eureka district. It is being worked and is yielding handsomely.

I. X. L. DISTRICT.

ITEMS.—Eureka *Sentinel*, Mar. 31: The Bayfield has sunk 3 shafts during the winter. The deepest is down 70 ft. An important strike has been made in it. Another shaft, 25 ft deep, has 12 ft of good ore, which assays $232.48 per ton. John T. lately struck a streak of galena on the west side of the mountain which assayed $700 per ton

PYRAMID DISTRICT.

JONES & KINKEAD.—Reno *Gazette*, Mar. 23: On the 400 level, where the rich strike has been made, there have been two crosscuts run. The one at the shaft shows the vein to be 11 ft wide; the other, 00 ft from the shaft, is 40 ft wide, and the walls spread as they go north. A drift was started north from the shaft, and after cutting through 14 ft of ore going from $8 to $50, the drift cut into a heavy black ore.

WINNEMUCCA DISTRICT.

BULLION BEE.—*Silver State*, April 3: A sample of ore from this mine assayed $104.08 in silver to the ton. The ledge, of which the assayed sample is a good average, is from 10 to 20 ft wide.

ARIZONA.

BREMEN'S '76.—*Silver Belt*, Mar. 31: Is delivering 13 tons to the mill daily, the average yield of which is $80 per ton, while in the office there are 10 tons that is principally sulphides with some chlorides and chloro-bromides. Among the lot there are large masses of silver glance that assays from $22,000 to $27,000 per ton, while the whole lot is estimated to be worth over $50,000.

LEGAL TENDER.—They are piling up large quantities of ore, ready for reduction when the mill starts, which has a capacity of 15 tons.

GLOBE DISTRICT ITEMS.—At the Lexington they have several tons of good ore on the dump. A fine body of ore has been struck in a drift started west from the bottom of the Independence shaft, 120 ft in depth. The same character of ore is coming in the faces of the east drift on the same level. The Queen shows a vein varying in width from 2 to 4 ft, at the depth of 70 ft. Two smaller veins on each side, apparently dipping towards the shaft ledge, carrying rich ore, and from 6 to 12 inches in width. The Dundee shows 25 tons of rich chloride ore on dump, with an immense amount of the same in sight. Rich ore is being taken from the blanket lead. The shaft is down 45 ft. Work on the Mack Morris is being pushed forward. The

CONTINUED ON PAGE 236,

Origin of Lakes.*

[By Prof. John Le Conte.]

The most casual glance at a map of the world reveals the fact that lakes are not uniformly distributed over the continents of the earth. They are far more numerous in the high northern latitudes of Asia, Europe and North America than in the regione hordering the eqnator and in the southern continents. The most notable exceptions to this law of lake distrihution occur in certain great plateau lakes in the torrid zone, and particularly those of equatorial Africa.

Nevertheless, the general fact that there ie a marked inequality in the distrihution of lacustrine hasins, which seems to be related to *latitude*, is significant, and may have an important hearing on the *theory of the origin of a certain class of lakes.*

Origin of Lakes in General.

Lakee occupy greater or less depressions in the eurface of the earth, which, from the configuration of the surrounding land, are not drained hy etreams, nor kept dry hy evaporation incident to climatic conditions.

The freshness or saltness of the waters which occupy these hollows depends mainly upon the circumstance whether the lakes are accompanied by *outlets* or not. In the former case they are usually fresh; in the latter case they are (unless of comparatively recent origin) generally salt; for, it is evident, as the saline matters brought in by affluent waters, must, in the absence of an outlet, accumulate in the hesin, it ie simply a question of time when the waters will hecome snccessively hrackish and salt.

It is obvious that euch depressione in the surface of the earth as constitute *lake basins*, may owe their origin to a variety of circumstances. Among these the following may be enumerated:

I.—Portions of Old Seas.

The remnants of an ancient ocean left in the depressions of ite bed as the waters retired when the continents were elevated above its surface, might give origin to lakes of all degrees of magnitude. Such remnants of old seas might hecome freshened when outlets were estahlished, and, on the contrary, when no outlets existed, their ealtness might progressively augment by the concentration of saline matters brought by affluent streams.

The so-called Caspian and Aral seas in Asia are supposed to have heen at some remote epoch portions of the Black sea. The surface of the water in the former is more than 80 feet helow the level of the adjacent ocean; and, as it has no outlet, it seems probahle that evaporation has concentratod its watere, and thus depressed their surface far helow the original level.

II.—Plateau Lakes.

Lakes in elevated plains or plateaus, heing eimple depressions in a nearly uniform surface, are likewise generally of considerable size, hut relatively of no great depth. To this class helong the equatorial lakes of Africa and the Great Salt Lake in Utah.

III.—Crater Lakes.

In volcanic regions the craters of extinct volcanoes eometimes constitute deep circular or elliptical basins, which serve as reservoirs for the meteoric waters that flow into them. Such lakes are comparatively small.

In the volcanic regions of the lower Rhine and the Eisel, between Coblentz and Boun, crater lakes are found in the miocene. Among these may be mentioned Gemunder Maar, Weinfelder Maar, Schaalkenmehren Maar, Pulver Maar, Meerfelder Maar and Laach. Many similar small lakes are to be found in the volcanic districts of other portions of Europe.

IV.—Earthquake Lakes.

Local subsidences have eometimes resulted from earthquakes, and thus given origin to lacustrine basins of greater or less dimensions. It is eaid that in the year 280 B. C., the large fresh-water lake of Oitz, in Japan, was formed in one night hy a prodigious subsidence of the ground.

But we have more recent and authentic examples of the formation of lakes hy this cause. It is well known that dnring the earthquakes which agitated the southern and western portions of the United States in the year 1811, an extensive area of gronnd in the valley of the Mississippi, near New Madrid, in Missouri, eubsided many feet, and thus gave origin to a lake.

V.—Accidental Lakes.

Extensive landslides, and eometimes lava currents, have heen known to dam up the beds of rivers, and thus form lakes of greater or less eize. The fall of the side of a mountain is said to have formed the Oschenen-See, in the canton of Berne in Switzerland. And the Lake of Aidat, near Clermont, Province of Auvergne, in Frence, seems to have heen formed by the lava of the Puy de la Vache damming up the river Sioule.

VI.—Lime-Sink Lakes.

In many limestone districts subterranean etreams undermine considerahle areas of ground, thus forming more or less extensive caverns or caves. By the falling in of the roofs of snch calcareous caverns, the well-known local depressions, designated lime sinks, are produced, forming reservoirs of greatsr or less extent, constituting fresh-water lakes or ponds. The heautiful miniature lakes which dot the surface of some portions of Florida, nndonhtedly owe their origin to this cause.

Glacial Origin of Lakes.

It is evident that the origin of a large number of lakes cannot, with any reasonahle show of prohahility, he referred to any of the causce ahove enumerated.

The vast number of lakes of varions sizes which dot the surfacee of the northern portions of the continents of Europe, Asia and North America, when taken in connection with their comparative ahsence in inter-tropical regions, very naturally led to the supposition that their origin might, in eome manner, he connected with glacial agencies.

This view seemed to he fortified hy the fact that, throughont most of the regions in which thie profusiou of lakes occurs, there are indnhitahle evidences of almost nniversal glaciation of the country.

Nevertheless, Central Asia seems to furnish a notable exception to thie association of lake hasins with glacial action; for, according to Raphael Pumpelly, there are "no traces of glaciation in Central Asia, outside of the high mountain chains."

The mode in which glaciers might have given origin to lakes, may be included nnder two distinct heads:

a—Moraine Lakes.

In all glacier countries, past or present, we frequently find lake basins that are evidently produced hy the damming up of a valley hy a perfectly symmetrical moraine, composed of houlders, fragments of rocks, gravel and sand. The beautiful circular lake in Switzerland, called the Feldsee, undonhtedly owes ite origin to this cause.

Several lakes on the Italian eide of the Alps, below Ivrea, and also among the monntains of Wales, have a eimilar origin. Numerous small mountain lakes in the Sierra Nevadas, as, for instance, Donner lake, obviously owe their origin to the same cause.

b.—Glacier-scooped Lakes.

In the year 1862, Mr. A. C. Ramsay, of England, promulgated the theory that a large portion of the lacuetrine hasins occurring in northern latitudes, and especially those fonnd in mountain valleys, owe their origin to the *scooping action of ancient glaciers on the softer rocks beneath.* In other worde, that ench lakee owe their origin to real glacier-scooped rock hasins. He ehows that in the great Alpine lakes there are no evidences of local depressione; on the contrary, the strata are cut ont hy some eroding agency.

Cavities of large dimensions containing water in mountainous regions may he said to he almost universally in the *course of valleys of erosion.* It is also evident "that the materials which once filled these hasins h ve been gradnally removed, so that older formations are now exposed to view at the hottom."

The only question is, therefore, whether the dennding force was moving ice or running water—a glacier or a river. Mr. Rameey maintains that *the action of water is incapable of excavating such basins, but that glaciers of enormous thickness and proportionate weight, would scoop out basins of the character containing these lakes.* No doubt Mr. Ramsay is perfectly right in insisting that it is highly unreasonahle to suppose "that these lakes lie in *areas of special depression*, made by the einking of the land underneath each lake." For, in some regions, the lakes are eo nnmerous and eo near to each other that the thcory of a particular depression for each one becomes untenahle. In the Alps, North Wales, Cnmherland, and the Highlands of Scotland they occur by the hnndred, and in the northern part of North America they occur by the thousand, "as if the whole country were eown broadcast with lakes, large and small;" eo that "it becomee an ahsurdity to suppose that, eo close together, *a special area of depression was provided for each lake.*"

But Mr. Ramsay seems to have reached the glacial theory by a *process of exclusion*, rather than by any *direct* evidence; for, having shown that the *sea* cannot form such hollows, nor *weather*, nor *running water*, and if the hollowe were not formed by *synclinal curves of the strata*, and if they do not lie in *gaping fissures*, nor yet in areas of *special depression*, the only remaining agent, according to Mr. Ramsay, "*is the denuding power of ice.*

He, nevertheless, snpports this view by two collateral considerations: 1st. In the region of the Alpe "all the large lakes lie in the direct channels of the great old glaciers—each lake in a true rock basin." 2d. The general result of the examination of the map of the world indicates that "for the rooky regions hoth north and eouth of the equator, the farther north or the farther eouth we go the more do lakee increase in numher," and "that this fact ie not a mere accidental coincidence, but is one of the strongest proofs of the former existence of that wide-epread coating of glacier ice, that in old times molded so much of the face of both hemispheres."

Notwithstanding the apparent probability of Mr. Ramsay's theory of glacier origin of mountain lakes, it is not free from the most serious physical difficulties. It is not very clear that a moving glacier would necessarily present so etriking a contrast to moving water in its capacity for eoooping out rock basine, for, so far as known, the lawe whioh regulate the flow of glaciers in monntain vallsys are idsntical with those which govsrn the flow of streams of watsr under like conditions. It is not, therefore, very obvious why its effects should not be strictly analagous to, if not the same as those of water. Like running water, the glacier movee moet rapidly near the center of ite eurface, and the motion is almoet imperceptihle at the margin and at the hottom of its hed. It is quite prohahle that the action of a glacier on its bed is, in some important features, different from that produced hy aqneoue erosion.

The characteristic striated appearance of the glaciated rocks, no lees than the *roches moutonnees* ehow that these ice-streams carry with them some of the mechanical effecte of solid hodies moving down inclined planes. But it hy no means follows that their erosive effects ehould so far differ from those of running water as to enahle glaciers to ecoop out the great lake hasins.

So far from this heing the case, would not the glacier "act as a great planing machine, wearing down the larger irregularities," and filling up the depressione with the detritue thns produced?

Moreover, when a glacial mass, in descending a sloping valley, reaches an extensive level eurface, like the hasin of Lake Superior, its motion on ite hed (if anything analogous to water), disappears, or hecomee quite insignificant, and hence its excavating or scooping power would vanish.

Thie consideration seems to render it almost certain that the numeroue lake basins of flat countries, like Finland and British America, could not have heen excavated by glaciers. And thus the principal eupport of the theory derived from the comparative profueion of lacnstrine basins in high northern latitudes, falls to the ground.

Again, as far ae known, existing glaciere do not operate upon their beds in the manner demanded hy Mr. Ramsay's theory.

Where opportunities are enjoyed of seeing part of a valley from which a glacier has retreated in historical times, no basin-shaped hollowe are conspicuous. (Lyell.)

The domed-shaped protuberances, the *roches moutonnees*, are frequent, but the cup-and-saucer-shaped cavities are wanting. (Lyell.)

Hence, it appears that without denying the glacier origin of certain small mountaine lakes, thie theory evidently fails to afford a satisfactory explanation of the vast nnmber of large and deep lacustrine hasins which are scattered over the surface of the earth in high latitudes. In truth, however, it is impossihle to speculate securely on questions of this kind without a larger eupply of *observed facts.*

Before speculating on the origin of snch basins, it is desirahle to ohtain much more exact information than we now possess in relation to the form and dimensions of exieting lake basins, and to ascertain the law of glacier motion when the ice stream reachee an extensive level surface.

Modified Glacial Theory.

Prof. Raphael Pumpelly has recently (*Am. Jr. Sci.*, 3d eeries, Vol. 17, p. 133, *et seq.* Feb., 1879,) propounded a theory in regard to the origin of lake hasins, which deserves coneideration. Pumpelly maintains that the glacial theory of Ramsay and Geikle, which assumes that snch hasins "are due to unequal sculpturing by glaciers," is useless in explaining the "lake hasins of flat countries, like Finland and British America," and still more unsatisfactory as an explanation of similar baeins in Central Asia, "hecause there are absolntely no traces of glaciation in Central Asia, outside of the high mountain chains. Prof. Pumpelly's theory seems to be that during pre-glacial times a vast nnmber of *rock-bound basins* were formed over the snrfaces of continents hy the *secular disintegration of the rocks*" while still *in situ.* It is evident that the formation of these baeins, heing due to the greater or less facility with which the rocks disintegrated nnder agencies acting through the immeasurahle pre-glacial periods, they might be of all eizes and depths. It is likewise evident that at the time of origin these basins wonld etill retain the residuary products of the secular rock disintegration; in other terms, they wonld be full of the disintegrated materials.

Now, the important question is, *how were these depressions emptied of their secular disintegrated materials.* According to Pumpelly, two agencies may have acted in removing the disintegrated materials from the rock hasins, viz., *ice* and *wind.*

I.—Ice.

In the plenitude of glacial times, when the whole northern hemisphere was covered with a cap of ice of enormous thickness, extending below latitude 40°, the disintegrated material filling the lake hasins, scattered over the comparatively level plains of northern Europe and America, was frozen to, and formed a part of, the vast ice sheet, which gradnally moved towards the equator. Consequently the contents of these hasine were dragged out by the advancing ice sheet.

II.—Winds.

Following up Baron Richthofen'e viewe, which escribes the origin of the great "Loess Formation" to the action of winds on the secnlar disintegrated rocks; that it is, in fact, "a eubærial deposit formed in a dry, central region." Prof. Pumpelly maintains that the lake hasins of Central Asia were emptied of their dry secular dieintegrated materials by the agency of winds.

Those who have witnessed the effects of sandetorms in arid regions are prepared to appreciate the important agency of winds in modifying the surface of the earth.

In concluding the discussion of the glacial origin of lakes, it may hs proper to rsmark that while saucer-shaped hasins might have heen emptied through the agency of moving ice, mechanical considerations seem to render it almost impossihle that deep cup-shaped rock hasine could have heen formed hy glacial action, either local or general. For, in these latter rock hasins, the eteep and precipitous sidee of the cavity induce mechanical conditions apparently inconsistent with the possihility of moving ice having either scooped out the hollow or dragged out the contents of the full hasin. It is true that in some inetances the precipitous condition of the sides of euch hasins might have heen a secondary effect, resulting from the snh-aqueous deposition of the detritue hrought from surrounding high ground hy glacial and aqueons agencies in operation dnring modern times.

But thie explanation is hardly applicahle to lacustrine hasins which are surrounded hy lofty and eteep mountains coming within a short distance of the margin of the lake. For example, it is difficult to imagine how the hasin containing Lake Tahoe, which is more than 1,600 feet deep within a short distance of its steep and rocky houndaries, could have heen excavated hy the agency of moving ice. But the most extraordinary chasm of this kind is the great fresh-water Siherian Lake Baikal. Thie vast reservoir is situated ahout 1,360 feet ahove the level of the sea in the midst of eteep mountain ranges, that often rise sheer from the water's edge in lofty walls of eyenite, gneiss or conglomerate. The recent reports in relation to its depth, are almost incredible. The depth of the upper part of the lake is given ae 3,027 meters (9,931 feet), ahout the hight of Mount Etna, and at its lower portion it ie said to attain a depth of 3,766 metere (12,356 feet). (*Vide Nature*, Vol. 17, p. 468.)

At the latter point these soundings show that the hottom of the lake must be depressed nearly 11,000 feet helow the level of the sea, which surpassee the greatest depth in the Mediterranean. There eeeme to be a vague impression that Lake Baikal originated in the sinking of the ground by the falling in of a subterranean cavern; hut there is probably no fonndation for such an opinion. It is proper to add that the enormous elongation of this lake (it is nearly 400 miles long) rendere the action of glacial agencies more possihle ae a cause of excavation than in the case of the much smaller cup-shaped hasins.

The foregoing viewe have been strikingly confirmed by recent expsrimental results and mathematical deductions by Mr. R. D. Oldham, contained in a paper entitled "On the Modulue of Cohesion of Ice of Lake Basins," (*Phil. Mag.*, 5th series, Vol. VII., p. 240, *et seq.* April, 1879.) Exaggerating all the data relating to the erosive action of ice, Mr. Oldham arrives at the following deductions:

1. "That no lake basin exceeding 700 feet in dspth or 5 miles in length could possihly owe its origin to glacial erosion, though the true limits are prohahly not one-tenth of these quantities."

2. "That no glacier could he pushed en masse over a horizontal plain for more than five miles."

To nnderstand the phyeical hasis of these deductions, it must he borne in mind that when the "modulus of cohesion" of the ice ie unahle to resist the "shearing stress" brought to hear upon it, there is a gradual motion of the internal portions among themselves, which is precisely analogous to the motions of viscous messes under the influence of gravity. The lowest etatum remains quiescent on the sunporting surface, while the upper portione of the viscoue mass move over it.

Gold Export of New Zealand.—The Thames *Advertiser* publishes the eubjoined return of the quantity and value of gold entered for exportation for the year ending Dec. 30, 1879:

	Ounces.	Values.
Auckland	37,901	£154,298
Picton	897	3,467
Nelson	4,851	18,648
Westport	18,120	72,482
Greymouth	68,641	274,570
Hokitika	56,203	218,675
Dunedin	92,866	367,157
Invercargill	10,003	90,011
Totals for 1879	287,464	£1,148,108

The *Railway Age*, in a recent iseue, eays: Capt. Eads etands etoutly by hie scheme of a great railway to carry ocean vessels bodily across the isthmue of Darien, and prononnces the rival canal scheme of De Lessps hopeless. He wante the Government to guarantee 6% dividends on $50,000,000 of stock, the guarantee to take effect after the works are completed, and a loaded ship of epecified tonnage, shall have been safely and satisfactorily transferred from ocean to ocean.

Prof. Aoassiz, of Boston, has become a rich man through the Calumet and Hecla copper minee of Lake Superior. His income for months past has been $2,500 a day. Within 10 years he has given to Harvard College $230,000. He is Preeident and shareholder in these mines, and is devoting most of his time to their development.

Of the American cent pieces the rarest dates are 1793, 1799, 1804, 1814, 1821, 1823, 1831, and from 1840 to 1849, inclusive. Of half cents 1793, 1795, 1796, 1802, 1810, 1811, 1827, 1836, from 1840 to 1850, inclnsive, 1852, 1854, 1855, 1856 and 1857.

---

*This is the first of a series of articles by Prof. Le Conte, and of great interest to the people of the Pacific coast. The succeeding papers treat of the distribution of lakes upon this coast, of the causes of the transparency of water, etc.—Editors.

A Meteorite.

There appeared an item in the San Bernardino *Times* some time since in regard to a mass of pure iron brought in from Ivanpah by Mr. Heber Huntington. It attracted the attention of Mr. H. G. Hanks, of the State Geological Society, and at his request the *Times* forwarded the specimen to him.

San Bernardino can claim the honor of the first meteorite ever found in the State. It was discovered by Mr. Stephen Goddard, who was returning to camp one evening after a prospecting trip, some eight miles from Ivanpah. In crossing a wash, with his pick on his shoulder, the appearance of what he thought a strange boulder attracted his attention, and he struck it with his pick. It returned a ringing sound to the blow, which caused him to examine it more carefully, and finding it an object out of the common, he returned next day and took it to Ivanpah, from whence it was brought to town by Mr. Huntington, and by that gentleman was placed in the hands of the editor of the *Times* for the State Geological Society:

Mr. John Isaac, San Bernardino.—DEAR SIR: The specimen mentioned in your letter, dated Feb. 17th, came duly to hand. It requires only a glance to decide its character. It is undoubtedly a mass of meteoric iron, and as far as I know, the first one ever found in the State of California. It is customary to give names to all meteorites, by which they may be known to the scientific world, and I shall take the liberty of calling this the California meteorite. Should another be found, it would naturally take its name from the county or town in which or near which it was discovered.

Cosmical or meteoric matter, which occasionally falls to the surface of the earth from space, has always been regarded with interest and curiosity. Man, in the days of earliest history, noticed with awe and wonder that stones sometimes fell from the skies. The frequent appearance of meteors, or, as they are sometimes called, fire balls, sailing grandly through the heavens and generally disappearing in an explosion, naturally gave rise to surmise and theory, and it is not unlikely some of the well-known mythological fables had their origin in the observance of these phenomena. In more modern times, they have claimed the attention of great and celebrated philosophers, who have theorized upon them without being able to decide with certainty as to their real origin. La Place supposed them to have been ejected from the craters of lunar volcanoes; others supposed them to be planetary bodies like the earth, but immeasurably smaller, which in like manner revolve around the sun, governed by the same laws.

It is believed by many that all space, or rather all space within our planetary system and by analogy, the same in other systems, is filled with cosmical matter, which revolves around the central sun, that the larger bodies known as the planets have plowed out, so to speak, furrows or channels through which they sweep, having long ago attracted the smaller bodies within a certain space, to themselves, and that from some aberration in the movement of either the larger body or the smaller ones, at certain periods a few of them come within attraction, and fall.

It is thought further, that the zodiacal light is a cloud of meteors upon which the sunlight falls, and if I am not mistaken, the comet's tail is supposed to be of a similar nature. The reader should consider that cosmical matter may be in any conceivable or almost inconceivable state of attenuation, and still be regarded as true matter.

The meteoric theory of the sun, may be found stated in detail in Tyndall's work, "Heat as a Mode of Motion." The heat of the sun is supposed to be caused by cosmical bodies falling upon its surface. If all other heavenly bodies except the earth and the meteors could be removed to a great distance, all the small bodies would be drawn with incredible velocity to the earth, causing it to become a small sun, blazing forth with an intensity great enough to melt all known elements and to vaporize many of them. If the theory is true that the earth has made a pathway for itself, it may have been a miniature sun while doing so.

It is considered by astronomers, that the inevitable fate of all the planets of our system is eventually to fall into the sun, and Tyndall has gone so far as to calculate what will occur when this takes place, in the following words: "An asteroid striking the sun with the former velocity (390 miles in a second) would develop more than 9,000 times the heat generated by the combustion of an equal asteroid of solid coal. If the earth should strike the sun, it would utterly vanish from perception, but the heat developed by it would cover the expenditure of a century."

Having thus given some of the theories concerning these celestial visitors, your readers may be equally interested in the facts.

The name "meteorite" is a general one, and includes all bodies, extra terrestrial, which fall to the earth from space. As to their origin, it is only possible to conjecture, but the fact that they do fall is beyond question. Fire balls or meteors have time and again been seen to approach the earth and soon explode, after which a shower of stones has been seen and heard to fall, the stones were found to be hot, and to differ from other mineral substances on the earth's surface.

The sound of the explosion has often been heard over a space of 25 miles in every direction. It is calculated that these meteoric bodies become luminous when they first enter our atmosphere, which in some cases has been proved to be 40 miles from the earth's surface; the incandescence is undoubtedly owing to the friction caused by the resistance of the atmosphere, and from the same cause, intensified, the explosion takes place. The succeeding fall of fragments generally forms a zone in the direction at which the meteor approached the earth, as they seldom if ever fall from the zenith. In some cases as many as 3,000 fragments have been collected from the destruction of a single meteor.

Much of the meteoric matter that reaches the earth is in the form of cosmical dust, and is much greater than is generally supposed, and, as the volume of the earth is to that extent increased, the effect this cause exerts on the movement of the globe is an interesting and important astronomical question.

Meteorites are divided scientifically into groups or classes based on their chemical or mineralogical nature, as follows:

1. Holosiderous.—Consisting of nearly pure iron; so much so that it can be put to all the uses of the best wrought iron. It is always associated with other metals in small quantities, nickel being seldom if ever absent.

2. Syssiderous.—Iron meteorites which are a sort of transition to the stony varieties. In the iron are found certain imbedded minerals, as peridot and pyroxenic silicates.

3. Sporadosiderous.—Stony meteorites in which the metallic iron is disseminated in grains, variable in size.

4. Polysiderous.—The metals and silicates may exist in nearly equal quantities; each granule is seen to be enveloped in a metallic coating; the stony matter is generally peridot or olivine, and pyroxene.

5. Oligosiderous.—This is the most common form. The siliceous mineral resembles trachyte. This variety contains a number of minerals common to the earth: nickeliferous native iron in very small grains, troilite, which is a sulphide of iron, chromic iron and several silicates.

6. Cryptosiderous.—In which the quantity of metallic iron is small but in which the number of terrestrial minerals is greater, in one instance as follows: Augite, anorthite, apatite, titanite, chromic iron, magnetite and magnetic pyrites.

7. Asiderons.—In which no metallic iron can be discovered.

The holosiderites are considered the most interesting of the meteorites; they may be seen in all of the great museums of the world, several large masses have been found in Mexico, New Mexico and in Arizona. The "Irwin-Ainsa" meteorite weighs 1,400 pounds; it was found near Tucson, Arizona, and was presented to the Smithsonian Institution. Dr. Irwin, through whose influence it was sent to Washington, says that the inhabitants of Tucson have a tradition that a shower of meteorites fell in the Santa Caterina mountains about 200 years ago, and that other masses of a similar character yet remain in these mountains.

Another specimen from Tucson, was presented to the city of San Francisco by Gen. James H. Carleton, which is now at the rooms of the California Pioneers. A description of it may be found in the proceedings of the California Academy of Science, vol. 3 folio 48, and a full analysis by Prof. Bush, of Yale College. In the same volume, folio 30, Prof. Whitney has shown that a belt or path of meteorites lies nearly in a line from the Colorado river at La Paz to San Luis Potosi, in Mexico, possibly fragments of the same meteor. A mass of metallic iron was found by Dr. Evans on Bald mountain, near Port Orford, Oregon. It will be seen by referring to a map that San Bernardino is in the same general direction. Now that you have found the first meteorite in California, it will be well to look for other fragments which are likely to be discovered.

This specimen should not be allowed to leave the State, but should be donated to the State Museum, which sooner or later will be instituted. HENRY G. HANKS.

Since the above was published, Mr. Hanks has recalled to mind a small mass of metallic iron brought to this city in 1871, when it was seen and described by Prof. B. Silliman in the *American Journal of Science and Arts* for July, 1873; with a figure from a photograph by Watkins of San Francisco. The name of the new meteorite will therefore be "*The San Bernardino Meteorite.*"

A PATENT CHALK MARK.—Not long ago, says an exchange, a man applied at the Patent Office, in Washington, for a patent of an invention which was refused, as the Examiner said, "because the invention was merely a chalk mark," and a man must be crazy to suppose that a chalk mark could be patented. But the man went into court and last week got a decision in his favor, in the shape of a mandamus compelling the Commission of Patents to issue the patent. The Judge said that a chalk mark could be patented if its application was useful and original. In this case it was applied to a piece of pasteboard, cut in a strip and fastened together in a circular form, with beveled edges, so that it could be slipped over sugar buckets, jars of sweetmeats, etc., to which insects are attracted. The man claims that all insects are repelled by chalk; and this circle of pasteboard, well chalked and tightly fitted, will act as a perfect guard against them.

Useful Information.

PUTTING UP AND RUNNING STEAM PUMPS.—The Dean Pump Works, of Indianapolis, gives the following valuable hints on the management of steam pumps: Never use a smaller pipe on the suction than the list indicates. Avoid right angles in the pipe where it is possible. Where it is practicable, make bends with a large radius. Put a foot valve and strainer on the end of the suction pipe. Do not place the pump more than 29 feet from the water. Where hot water is pumped, the supply must be above the pump. Make all joints in the suction pipe tight. A small leak in the suction is very detrimental. Keep the stuffing boxes nicely packed. Oil the pump before starting it, and keep the oil wiped off where it is not needed. Some engineers seem to think that if their boilers are supplied with water, there is no need of looking after the pump or taking any care of it. A good pump is as worthy of being taken care of as a good engine, and we would suggest to all engineers and persons using or having charge of pumps, that they spend a few minutes every day in cleaning them up, removing all extra oil on them, wiping off the dust and dirt and seeing that they are in good condition and working well.

HINTS ON THE USE OF PLASTER OF PARIS.—The plaster may be made to "set" very quickly by mixing it in warm water to which a little sulphate of potash has been added. Plaster of Paris casts, soaked in melted paraffine, may be readily cut or turned in a lathe. They may be rendered very hard and tough by soaking them in warm glue size until thoroughly saturated, and allowing them to dry. Plaster of Paris mixed with equal parts of pumice stone makes a fine mold for casting fusible metals; the same mixture is useful for encasing articles to be soldered or brazed. Casts of plaster of Paris may be made to imitate fine bronzes by giving them two or three coats of shellac varnish, and dusting on fine bronze powder when the mastic varnish becomes sticky. Rat holes may be effectually stopped with broken glass and plaster of Paris. A good method of mixing plaster of Paris is to sprinkle it into the water, using rather more water than is required; when the plaster settles, pour off the surplus water and stir carefully. Air bubbles are avoided in this way.

NEW FLUID PROPELLER OR MOTOR.—Mr. John B. Vliet, of Dartford, Wis., has invented a device for propelling fluids through tubes, and also for utilizing the motive force of fluids flowing through tubes. A wheel having diagonal blades is mounted upon a shaft journal axially in a cylindrical casing. This shaft is supported by a hollow cylinder which covers the sides of the wheel, leaving only the blades exposed. The inner cylinder has conical ends, and is connected with the outer cylinder by hollow arms, through which passes a belt which drives the wheel when the device is used as a fluid propeller. When the machine is used as a motor the belt receives its power from the pulley on the wheel shaft. The inventor proposes, in addition to the uses already named, to use the device as a fluid meter. In actual use the main casing will be connected with the pipes through which the fluid is to be moved, or through which water flows if it is used as a motor.

A HOUSEHOLD WATER MOTOR.—In Zurich, Switzerland, the use of a portable water power, so to speak, is being extensively used for household purposes. Firewood, for example, is to be sawn into convenient lengths for burning. A small sawing machine on wheels is drawn by two men to the front of a house. They connect by a flexible tube with the nearest hydrant; the water flows to the machine; the saw dances and cuts up the wood with surprising rapidity. A portable turbine has also been invented, and employed in many places in the same city, in driving a Gramme machine for the production of electric light. Water is very abundant in Zurich; but there are other towns in which this domestic water power could be advantageously introduced. Where it is any object to keep a record of the water used, an indicator showing the quantity may be affixed to the machine.

ARTIFICIAL stone can be produced by the following process, recently discovered by Ternikoff: "A mortar consisting of equal parts of lime and sand is exposed for a few hours to a temperature of 150 degrees centigrade in the presence of water vapor. The paste having been taken out of the furnace is now passed under the cylinders of a machine like that used for molding bricks, and it comes out in the form of cubes which, on being exposed to the air, become dry and hard. In the course of eight or nine hours these cubes are as hard as good building stones, and are fit for use. This artificial stone is, in fact, a sort of brick of mortar baked at a low temperature, and the cost, too, is about the same as that of bricks."

WHITE gutta-percha is obtained by precipitating a solution of ordinary gutta-percha in chloroform by alcohol, washing the precipitate with alcohol, and finally boiling it in water, and molding into desired form while still hot.

TO REMOVE INK STAINS.—Take of muriate of tin two parts, water four parts. To be applied with a soft brush, after which the paper must be passed through cold water.

Good Health.

Evils of Neglecting Cold in the Head.

In a paper read by Dr. D. B. St. John Roosa, at the recent meeting of the Medical Society of the State of New York, he stated that the most frequent origin of chronic diseases of the lachrymal passages, of the conjunctiva, and of the middle ear, is in a neglected "cold in the head." It is generally conceded that no person in perfect health, except under extraordinary circumstances, takes cold, and yet the majority of mankind have, at some time, suffered from cold in the head. The popular idea that a cold in the head is an insignificant affair is founded on the fact that most of the people recover to such an extent that they are able to go about afterward and engage in their ordinary avocations without special notice, at the time, of the consequences of the disease, which may even then be settled upon them. He believed that very many of the maladies which prevented men and women from reaching the allotted period of three score and ten have their origin in these colds; and that many serious affections which act as an impediment to the success of their victim are dated from a cold in the head.

He described the suffering incident to an acute attack of cold in the head, and of the impossibility of having repeated attacks without producing serious local changes—not only local change, but a permanent impairment of nutrition. To correct all this, special attention must be paid to *individual* hygiene, and if the evil consequences of neglected cold in the head were to be abolished, the abolition must come through a public sentiment properly educated upon this as upon all other sanitary questions. The family physician must warn the people everywhere, as opportunity offers, of the danger in this direction, and of the means by which it is to be avoided. The first great precaution to be taken by each individual is to keep himself in a good general condition, and to do that he must studiously avoid all that tends to disorder the skin and the functions of all the organs of the body. Children must be clothed in flannel all the year round, and must be made to know that the staples of diet are milk, bread, meat, vegetables and fruit, and that tea, coffee and pastry of all kinds are to be used only as the greatest of luxuries, and therefore in small quantities and at long intervals. The community can only become healthy as individuals become healthy, and all the reforms necessary to make Memphis and Granada places in which yellow fever never comes may be adopted; but if the control cannot be obtained of the bodies of, and the modes of living of the individuals in those and all other places, evils not so suddenly fatal, but none the less in the end dangerous, and all the time injurious to their well being, will certainly exist.

CAUSE OF INTERMITTENT FEVER.—The July number of the *Zeitschrift*, edited by Prof. Klebs, contains some particulars of an investigation into the physical cause or poison to which marsh or intermittent fever is due. The inquiry was conducted by Prof. Klebs, of Prague, in conjunction with Signor Tommasi, Professor of Pathological Anatomy at Rome. The two investigators spent several weeks during the spring season in Agro Romano, which is notorious for the prevalence of this particular kind of fever. They examined minutely the lower strata of the atmosphere of the district in question, as well as its soil and stagnant waters, and in the two former they discovered a microscopic fungus, consisting of numerous movable shining spores of a longish oval shape. This fungus was found to be artificially generated in various kinds of soil. The fluid matter obtained was filtrated and repeatedly washed, and the residuum left after filtration was introduced under the skin of healthy dogs. The animals experimented on all had the fever, with the regular typical course. After explaining minutely the results of their various investigations and experiments, these gentlemen are of opinion that they have discovered the real cause of the disease in question. As the fungus grows into the shape of small rods, Tommasi and Klebs have given it the name of *Bacillus malariæ.*—*Medical Times and Gazette.*
